7. The planets move in ellipſes that have their foci in the center of the ſun, and deſcribe areas proportionable to their times. This we have already laid down, *à poſteriori*, as a phænomenon; and now that the principle of the heavenly motions is ſhewn, we deduce it therefrom, *à priori*. Thus, ſince the weights of the planets towards the ſun are reciprocally as the ſquares of their diſtances from the center of the ſun; if the ſun were at reſt, and the other planets did not act on each other, their orbits would be elliptical, having the ſun in the common umbilicus, and would deſcribe areas proportionable to the times; but the mutual actions of the planets are very ſmall, and may be well thrown aſide. See ORBIT.

Indeed the action of Jupiter on Saturn is of ſome conſequence; and hence, according to the different ſituation and diſtances of thoſe two planets, their orbits will be a little diſturbed. The earth's orbit too is ſenſibly diſturbed by the action of the moon; and the common center of the two deſcribes an ellipſis round the ſun placed in the umbilicus; and, with a radius drawn to the center of the ſun, deſcribes areas proportionable to the times. See EARTH, ORBIT, &c.

8. The aphelia and nodes of the planets are at reſt, excepting for ſome inconſiderable irregularities ariſing from the action of the revolving planets and comets. Conſequently, as the fixed ſtars retain their poſition to the aphelia and nodes, they too are at reſt. See the article NODE, &c.

9. The axis, or polar diameter of the planets, is leſs than the equatorial diameter.

The planets, had they no diurnal rotation, would be ſpheres, as having an equal gravity on every ſide: but by this rotation the parts receding from the axis endeavour to riſe towards the equator, which, if the matter they conſiſt of be fluid, will be affected very ſenſibly. Accordingly Jupiter, whoſe denſity is found not much to exceed that of water on our globe, is obſerved by aſtronomers to be conſiderably leſs between the two poles than from eaſt to weſt. And, on the ſame principle, unleſs our earth were higher at the equator than towards the poles, the ſea would riſe under the equator, and overflow all near it. But this figure of the earth Sir Iſaac Newton proves likewiſe *à poſteriori*, from the oſcillations of pendulums being ſlower and ſmaller in the equinoctial, than in the polar parts of the globe. See EARTH.

10. All the moon's motions, and all the inequalities of theſe motions, follow from theſe principles, e. gr. her unequal velocity, and that of her nodes and apogee in the ſyzygies and quadratures; the differences in her eccentricity and her variation. See MOON.

11. From the inequalities of the lunar motions, we can deduce the ſeveral inequalities in the motions of the ſatellites.

12. From theſe principles, particularly the action of the ſun and moon upon the earth, it follows, that we muſt have tides, or that the ſea muſt ſwell and ſubſide twice every day. See TIDE.

13. Hence, likewiſe, follows the whole theory of comets, as that they are above the region of the moon, and in the planetary ſpaces; that they ſhine by the ſun's light, reflected from them; that they move in conic ſections, whoſe umbilici are in the center of the ſun; and, by radii drawn to the ſun, deſcribe areas proportional to the times; that the orbits or trajectories are very nearly parabolas; that their bodies are ſolid, compact, &c. like thoſe of the planets, and muſt therefore acquire an immenſe heat in their perihelia; that their tails are exhalations ariſing from and encompaſſing them like atmoſpheres. See COMET.

NICHE, in architecture, a hollow ſunk into a wall, for the commodious and agreeable placing of a ſtatue.

The ordinary proportion of a niche is to have two circles in height and one in width; but M. Le Clerc makes their height ſomething more, the exceſs being to compenſate for the height of the pedeſtal of the ſtatue. The hollow is ſemicircular at bottom, that is, in its plan; and at top it terminates in a kind of canopy. Niches have frequently an impoſt, and an archivolt or headband, and the canopy wrought and enriched in the manner of a ſhell. The breadth of the archivolt may be made equal to a ſixth or ſeventh part of the niche, and the height of the impoſt to a fifth or ſixth part of the ſame: and the impoſt and archivolt ought to conſiſt of ſuch mouldings as have ſome relation to the architecture of the place. Niches are ſometimes made with ruſtic-work, ſometimes with ſhell-work, and ſometimes of cradle or arbour-work. Niches are ſometimes made ſquare, but theſe want all the beauty of the others.

NICOLAITANS, in church-hiſtory, Chriſtian heretics who aſſumed this name from Nicolas of Antioch; who, being a Gentile by birth, firſt embraced Judaiſm, and then Chriſtianity; when his zeal and devotion recommended him to the church of Jeruſalem, by whom he was choſen one of the firſt deacons. Many of the primitive writers believe that Nicolas was rather the occaſion than the author of the infamous practices of thoſe who aſſumed his name, who were expreſsly condemned by the ſpirit of God himſelf, Apoc. ii. 6. And indeed their opinions and actions were highly extravagant and criminal. They allowed a community of wives: made no difference between ordinary meats and thoſe offered to idols: and told I know not what fables of the creation and diſpoſition of the world. According to Euſebius, they ſubſiſted but a ſhort time; but Tertullian ſays, that they only changed their name, and that their hereſies paſſed into the ſect of the Cainians. See the article CAINIANS.

NICOTIANA, in botany, a plant more commonly known by the name of tobacco. See TOBACCO.

NICTITATING *Membrane*, in comparative anatomy, a thin membrane, chiefly found in the bird and fiſh-kind, which covers the eyes of theſe animals, ſheltering them from the duſt, or too much light; yet is ſo thin and pellucid, that they can ſee pretty well through it.

NIDUS, among naturaliſts, ſignifies a neſt, or proper repoſitory for the eggs of birds, inſects, &c. wherein the young of theſe animals are hatched and nurſed.

NIECE, a brother or ſiſter's daughter, which in the civil law, is reckoned the third degree of conſanguinity.

NIGHT, that part of the natural day during which the ſun is underneath the horizon; or that ſpace wherein it is duſky. See DAY.

Night was originally divided by the Hebrews, and other eaſtern nations, into three parts, or watchings. The Romans, and afterwards the Jews from them, divided the night into four parts, or watches, the firſt of which began at ſun-ſet and laſted till nine at night, according to our way of reckoning; the ſecond laſted till midnight; the third till three in the morning; and the fourth ended at ſun-riſe. The ancient Gauls and Germans divided their time not by days but by nights; and the people of Iceland and the Arabs do the ſame at this day. The like is alſo obſerved of our Saxon anceſtors.

NIGHT-MARE, in medicine, a diſeaſe called by phyſicians ephialtes and incubus. See INCUBUS.

NIHILS, or NICHILS, iſſues which a ſheriff who is oppoſed in the Exchequer, ſays are nothing worth, and not to be levied, through the inſufficiency of the parts from whom the ſame are due.

NIMBUS, in antiquity, a circle obſerved on certain medals, or round the head of ſome emperors, anſwering to the circles of light, drawn around the images of ſaints. The nimbus is ſeen on the medals of Maurice, Phocas, and others, even of the upper empire.

NIPPERS, in the manege, are four teeth in the fore part of a horſe's mouth, two in the upper, and two in the lower jaw. A horſe puts them forth between the ſecond and third year.

NIPPERS is alſo an inſtrument in uſe among ſmiths and farriers, being a kind of pincers, wherewith in ſhoeing a horſe, they cut the nails before they rivet them. It is alſo uſed in taking off a ſhoe.

NIPPLES, *Papillæ*, in anatomy. See BREAST.

NISI PRIUS, in law, a judicial writ which lies in caſes where the jury being impannelled and returned before the juſtices of the bank, one of the parties requeſts to have ſuch a writ, for the eaſe of the country, in order that the trial may come before the juſtices in the ſame county on their coming thither. Theſe trials by niſi prius are intended for the eaſe of the country, by ſaving the parties, jurors, and witneſſes, the trouble of coming to Weſtminſter. The purport of a writ of niſi prius is, that the ſheriff is thereby commanded to bring to Weſtminſter the men impannelled, at a certain day before the juſtices, *niſi prius juſticiarii domini regis ad aſſiſas capiendas venerint*; that is, unleſs the juſtices go before the day into ſuch a county to take aſſizes. See the article JUSTICES.

NITRE, or SALTPETRE, a neutral ſalt, formed by the coalition of the common vegetable fixed alcaline ſalt with a peculiar acid: of a ſharp, penetrating, cooling taſte: ſoluble in eight times its weight of very cold water, in leſs than thrice its weight of water temperately warm, and in one third its weight of boiling water: concreting from its ſaturated ſolutions, on evaporation of a part of the fluid, or a gradual diminution of the heat that kept it diſſolved, into colourleſs tranſparent cryſtals, which in figure are hexagonal priſms terminated by pyramids of the ſame number of ſides: melting thin as water in a moderate heat: when heated to ignition, deflagrating on the contact of any inflammable ſubſtance, with a bright flame and a conſiderable hiſſing noiſe; and leaving, after the detonation, its fixed alcaline ſalt, the acid being deſtroyed in the act of accenſion.

The origin of nitre, or rather of the acid which makes the characteriſtic part of nitre, is unknown. Thus much only is known with certainty, that common waters, both atmoſpherical and ſubterraneous, often contain a little of this acid in combination with earthy or other bodies, ſo as to yield, by cryſtallization, on ſupplying the vegetable fixed alcali, a perfect nitre: and that when animal or vegetable ſubſtances, mixed with porous abſorbent earths, have lain expoſed to the air till they are thoroughly rotted, they are found in like manner to contain a ſmall portion of nitrous acid, ſo as to give out a little nitre to water, on being ſupplied with the proper alcaline baſis. On this foundation, ſome nitre is prepared in different parts of Europe; but the greateſt quantities are the produce of the Eaſt-Indies: the means by which it is there ſo plentifully obtained, or whether it is a natural production, have not yet, ſo far as we can learn, been revealed.

Nitre, as brought into the ſhops, has generally a greater or leſs admixture of ſea-ſalt, from which it is purified, by diſſolving it in boiling water, and, after duly evaporating the filtered ſolution, ſetting it in a cold place to cryſtallize. The more impure brown nitre requires repeated diſſolution and cryſtallization; to promote the purification, it is commonly diſſolved in lime-water, or the ſolution ſuffered to percolate through quick-lime and wood aſhes. It is obſervable that nitrous ſolutions differ from thoſe of moſt other ſalts in contracting no pellicle in evaporation: if a ſolution of rough nitre, containing ſea-ſalt, be boiled down till a pellicle appears, or till a part of the ſalt begins to concrete and fall to the bottom, all that thus ſeparates is found to be ſea-ſalt, boiling water keeping far leſs of this ſalt diſſolved than it does of nitre: but if the liquor be now poured off, though it ſhould ſtill retain a quantity of the ſea-ſalt, only the nitre will cryſtallize in cooling, ſea-ſalt continuing diſſolved in nearly as little water when cold, as was ſufficient to keep it diſſolved when boiling.

This ſalt is one of the principal medicines of the antiphlogiſtic claſs; of general uſe in diſorders accompanied with inflammatory ſymptoms whether chronical or acute, and as a corrector of the inflammation or irritation produced by ſtimulating drugs. Hoffmann thinks it has an advantage above the refrigerants of the acid kind, in not being liable to coagulate the animal juices; ſolutions of it mingling with or diſſolving recent thick blood, and in ſome degree preſerving it from coagulation, as well as corruption; at the ſame time changing its colour, when dark or blackiſh, to a crimſon; an effect which it produces alſo, in a leſs degree, upon the fleſhy parts of dead animals. It retards likewiſe the coagulation of milk, but ſeems, from Stahl's account, to increaſe the conſiſtence of thin ſerous humours; for he obſerves, that when uſed in gargariſms for inflammations of the fauces in acute fevers, it thickens the ſalival fluid into a mucus, which keeps the parts moiſt for a conſiderable time; whereas, when nitre is not added, a dryneſs of the mouth preſently enſues.

This medicine generally promotes urine, and often gives relief in ſtranguries and heat of urine, whether ſimple, or proceeding from a venereal taint. It ſometimes looſens the belly, particularly in hot diſpoſitions: in cold phlegmatic temperaments it rarely has this effect, though given in very large doſes, even to an ounce: the diarrhæas of acute diſeaſes, and fluxes in other circumſtances, from an acrimony of the bile or inflammation of the inteſtines, have been frequently reſtrained by it. In high fevers it often promotes a diaphoreſis or ſweat; in malignant fevers, where the pulſe is low, and the ſtrength greatly depreſſed, it impedes that ſalutary excretion and the eruption of the exanthemata, in conſequence of its general power of diminiſhing inflammation and heat. It ſeems to be prejudicial in diſorders of the lungs, though ſome have ventured to preſcribe it in hemoptyſes.

The uſual doſe of nitre, among us, is from two or three grains to a ſcruple; though in many caſes it may be given with great ſafety, and to better advantage, in larger quantities. It has been ſaid, that nitre loſes in being melted, half its weight of watery moiſture, and recovers this weight again, on being diſſolved and cryſtallized; from whence it would follow, that one part of melted nitre is equivalent to two of the cryſtals: but there was probably ſome miſtake in this experiment; for Mr. Lewis ſays, he has often repeated it with different parcels of nitre, and never found the loſs to be ſo much as one twentieth of its weight.

Nitre may be commodiouſly taken in the form of troches; one part of the purified ſalt is commonly ground with three parts of fine ſugar, and the mixture made up with muciſage of gum tragacanth. In this and all other ſolid forms it is accompanied, however, with one inconvenience,

venience, being liable, eſpecially when the doſe is conſiderable, to occaſion a pain or uneaſineſs at the ſtomach, which can be prevented only by plentiful dilution. A liquid form is therefore, in general, the moſt eligible, and may be eaſily rendered grateful by a proper addition of ſugar: commonly half an ounce of nitre, and two ounces of fine ſugar, with a ſcruple of cochineal, as a colouring material, are boiled in two pints and a half of water, till half a pint is waſted, and after ſtanding to ſettle, the clear purpliſh red liquor poured off for uſe. The boiling ſerves only to haſten the ſolution, and needs not be continued longer than till the ſalts are diſſolved, and a ſufficient colour extracted from the cochineal.

The chemiſts have thought to improve the virtue of nitre by deflagration with a ſmall portion of ſulphur: they melt the nitre in a crucible, and gradually ſprinkle on it one twenty-fourth of its weight of flowers of ſulphur: when the deflagration is over, they pour out the melted ſalt into clean, dry, warm braſs moulds, ſo as to form it into little cakes; whence it is called *ſal prunellæ*, or *cryſtallus mineralis*.

In this proceſs, a part of the acid of the nitre, and the inflammable principle of the ſulphur, detonating together, are both deſtroyed; while that part of the alcali of the nitre, which is thus forſaken by its acid, unites with the acid of the ſulphur, which is the ſame with that of vitriol, into a new neutral ſalt, the ſame with vitriolated tartar; and the preparation is found to be no other than a mixture of unchanged nitre, with a ſmall portion of this vitriolated ſalt. If the nitre and ſulphur be taken in equal quantities, the mixture injected by a little at a time into a red hot crucible, and, after the detonation ceaſes, kept in the fire about an hour, nearly the whole of the nitre will thus be changed; and the remaining ſalt, purified by ſolution in water, proves almoſt wholly the ſame with vitriolated tartar. This is called *ſal polychreſtum*.

The ſame ſalt is produced by pouring gradually on nitre the pure acid of vitriol or ſulphur: this acid, uniting with the alcali, diſengages the acid of the nitre, which begins to exhale, immediately on mixture, in yellow or red fumes, and may be collected by diſtillation in a glaſs retort with a moderate fire. Some previouſly dilute the vitriolic acid with equal its quantity of warm water; and afterwards purify the diſtilled nitrous ſpirit from this ſuperfluous phlegm, by a ſecond diſtillation in a glaſs cucurbit; the watery part riſing in the heat of a water-bath, and leaving the more concentrated acid behind. One part of oil of vitriol extricates all the acid of two parts of nitre; the remaining ſalt is nearly a pure vitriolated ſalt. If three parts of nitre be uſed to one of the vitriolic acid, a part of the nitre remains unchanged: on diſſolving the whole reſiduum in hot water, and ſetting the filtered ſolution to cryſtallize, the vitriolated ſalt ſhoots firſt, greateſt part of the nitre continuing diſſolved.

The nitrous ſpirit is obtained alſo by diſtillation in a ſtrong fire with vitriol in ſubſtance; the vitriol parting in the fire with its own acid, which then acts upon the nitre, and extricates its acid in the ſame manner as when the pure vitriolic acid is uſed The ſpirit thus diſtilled, called aqua fortis, is more phlegmatic than the preceding, in proportion as the vitriol employed contains more phlegm than the oil of vitriol: it is likewiſe liable to an admixture of the vitriolic acid, more or leſs of which is generally forced over. The proportions commonly followed are, three parts of nitre, three of green vitriol uncalcined, and one and a half of the ſame vitriol calcined; or one of nitre, and two of vitriol calcined to whiteneſs; or equal parts of nitre, calcined vitriol, and dry clay, which laſt ingredient appears to be of very little uſe in the proceſs. The ingredients are well mixed together, the diſtillation performed in an earthen retort, or an iron pot, fitted with an earthen head and a receiver, and continued ſo long as any red vapours ariſe.

The nitrous ſpirit, uſually diſtilled from rough nitre, contains often an admixture of the marine acid, as well as of the vitriolic. The firſt is diſcovered and ſeparated, by dropping in a little ſolution of ſilver; the latter by a ſolution of chalk, or any other calcareous earth, made in the pure nitrous acid; the ſilver abſorbing the marine acid, and the chalk the vitriolic, and forming with thoſe acids reſpectively, indiſſoluble concretes, which immediately render the liquor milky, and on ſtanding ſettle to the bottom. The ſolutions are to be cautiouſly and ſlowly dropped in, ſo long only as they continue to produce a milkineſs: in caſe of an exceſs in their quantity, if the ſpirit is required perfectly pure, it is to be rectified by rediſtillation.

By the property on which the above method of purification depends, the nitrous ſpirit may be readily diſtinguiſhed from the other two mineral acids. By the red or yellowiſh red colour of its fumes; by its forming with one fourth its weight of ſal ammoniac, or with ſea ſalt, or its acid, a menſtruum called aqua regia, that perfectly diſſolves gold; by its deflagrating on the contact of any inflammable matter, when heated to ignition, whatever other body it be previouſly combined with; it may with certainty be diſtinguiſhed, both from thoſe and from every other known ſpecies of acid.

This acid has been ſometimes given as a diuretic, from two or three to fifty drops, diluted largely with water; but its principal uſe is in combination with other bodies.

Combined with vegetable fixed alcalies, it reproduces common nitre. With the mineral fixed alcali or ſoda, it compoſes a ſpecies of nitre in ſome reſpects different from the common, cryſtallizing not into a priſmatic, but a cubical figure; with volatile alcalies, ſubtile pungent ſalt, remarkable for its ſolubility in ſpirit of wine: of theſe two compounds, the medicinal qualities are little known, though they ſhould ſeem to be well deſerving of enquiry. The acid, in the moſt concentrated ſtate in which it is commonly met with, ſaturates about five ſixths its weight of vegetable fixed alcali; but of volatile alcali little more than half its weight. For obtaining the combination with the mineral alcali, ſea-ſalt may be uſed equally with ſoda or the alcali in its pure ſtate; for the nitrous acid extricates the ſea-ſalt's acid, and unites with only its pure alcaline baſis.

Solutions of calcareous earths in this acid are in taſte bitteriſh, and very pungent. They are difficultly made to aſſume a cryſtalline appearance; and when evaporated and exſiccated by heat, the dry ſalt deliquiates again in the air. This ſalt has not hitherto been employed medicinally, nor is it as yet much known. It is a common ingredient in waters, which when its quantity is conſiderable, it renders hard, and indiſpoſed to putrefy, apparently impeding putrefaction in a much greater degree than an equal quantity of ſea-ſalt. Alcaline ſalts, fixed or volatile, added to the ſolutions, precipitate the earthy baſis; and uniting with the acid in its ſtead, compoſe therewith, according to the ſpecies of alcali employed, the common cubical or ammoniacal nitre, mentioned in the preceding paragraph.

The nitrous ſpirit diſſolves zinc, iron, copper, lead, biſmuth, mercury, and ſilver, the moſt readily of all the acids: tin it diſſolves immediately; regulus of antimony it only corrodes.

The concentrated acid, combined with a due proportion of rectified ſpirit of wine, loſes its acidity; the coalition of the two producing a new compound, called *ſpiritus nitri dulcis*, of a gratefully pungent taſte and odour, and which is given from a few drops to a teaſpoonfull, or more, as mildly aperient, diuretic, antiphlogiſtic, in ſome degree anodyne and antiſpaſmodic. On mixing the two ſpirits together, a great heat, ebullition, and noxious red vapours ariſe: this conflict is leſs violent, when cautiouſly, and by little and little, the acid ſpirit is added to the vinous, than when the vinous is added to the acid. One part of the ſtrong acid ſpirit is commonly taken to three of the ſpirit of wine, or half a pound to a quart: the mixture, after ſtanding for ſome time, that the two liquors may in ſome degree unite, is ſet to diſtil with a gentle fire, by which the union is completed, and the very volatile dulcified ſpirit ſeparated from the more fixed acid that remains undulcified. The diſtillation is directed to be continued ſo long as the ſpirit that comes over raiſes no effervescence with fixed alcaline ſalts; it may be regulated more commodiouſly by performing the proceſs in a water-bath,

bath, for all that riſes in this heat will be found to be a pure dulcified ſpirit.

A ſubtile æthereal fluid, ſimilar in its general qualities to that deſcribed under the article Æther, is obtainable with the nitrous ſpirit in a more compendious manner. If equal parts by meaſure of ſpirit of nitre and ſpirit of wine, of moderate ſtrength, be mixed together, the bottle cloſely ſtopped and ſet in a cool place, a large proportion of æther riſes to the ſurface in a few days: it may be purified from the adhering acid, by ſhaking it with water in which ſome fixed alcaline ſalt has been diſſolved, and then drawing off the æther by diſtillation. The medicinal qualities of this ſubtile fluid are not as yet known.

NOBILITY, a quality that enables and raiſes a perſon poſſeſſed of it above the rank of a commoner.

The origin of nobility in Europe is by ſome referred to the Goths; who, after they had ſeized a part of Europe, rewarded their captains with titles of honour, to diſtinguiſh them from the common people. In Britain the term nobility is reſtrained to degrees of dignity above knighthood: but every where elſe nobility and gentility are the ſame. The Britiſh nobility conſiſts only of five degrees, viz. that of a duke, marquis, earl, or count, viſcount, and baron, each of which ſee under their proper articles.

In Britain theſe titles are only conferred by the king, and that by patent, in virtue of which it becomes hereditary. The privileges of the nobility are very conſiderable: they are all eſteemed the king's hereditary counſellors, and are privileged from all arreſts, unleſs for treaſon, felony, breach of peace, condemnation in parliament, and contempt of the king. They enjoy their ſeats in the houſe of peers by deſcent, and no act of parliament can paſs without their concurrence: they are the ſupreme court of judicature, and even in criminal caſes give their verdict upon their honour, without being put to their oath. In their abſence they are allowed a proxy to vote for them, and in all places of truſt are permitted to conſtitute deputies, by reaſon of the neceſſity the law ſuppoſes them under of attending the king's perſon: but no peer is to go out of the kingdom without the king's leave, and when that is granted, he is to return with the king's writ, or forfeit goods and chattels.

NOBLE, a money of account, containing ſix ſhillings and eight pence.

The noble was antiently a real coin, ſtruck in the reign of Edward III. and then called the penny of gold; but it was afterwards called a roſe-noble, from its being ſtamped with a roſe: it was current at 6s. 8d.

NOCTAMBULI, *Noctambulones*, *Somnambuli*, ſuch perſons as riſe and walk about in their ſleep.

The word is Latin, and formed of *nox*, night, and *ambulo*, to walk.

The diſorder conſiſts in this, that the proper organs of muſcular motion are at liberty, while thoſe deſtined for ſenſation are bound up, or inactive.

Certain ideas follow upon certain motions of the fibres of the brain, and certain motions of thoſe fibres upon certain ideas. Now, by much thinking on any one thing, the fibres acquire ſome permanent ſituation, which gives a freer paſſage to the ſpirits towards a certain part of the body than ordinary. If then the animal ſpirits become too copious, too much agitated, or conſiſt of parts too ſolid, they throw themſelves into the paſſages they find the next open, glide into the nerves and muſcles correſponding to theſe paſſages, and there produce the motions proper to thoſe muſcles.

The bilious, melancholic, and ſanguine, are moſt ſubject to thoſe nocturnal vagaries.

The remedies are all ſuch things as temper the agitation of the ſpirits and relax the fibres, as bleeding, and all coolers, either internally or externally exhibited: aperitives too have a good effect; but the beſt remedy, according to ſome, is the cold bath.

NOCTILUCA, in phyſiology, a ſpecies of phoſphorus, ſo called becauſe it ſhines in the night without any light being thrown upon it; ſuch is the phoſphorus made of urine. See PHOSPHORUS.

NOCTURNAL, ſomething relating to the night, in contradiſtinction to diurnal.

The word is formed of the Latin *nox*, night, and *luceo*, to ſhine.

NOCTURNAL ARCH, in aſtronomy, the arch of a circle deſcribed by the ſun, or ſtar in the night.

Semi-NOCTURNAL *arch of the Sun*, that portion of a circle he paſſes over between the lower part of our meridian, and the point wherein he ſets, or the point of the horizon wherein he riſes.

NOCTURNAL, *Noctulabium*, an inſtrument chiefly uſed at ſea, to take the altitude or depreſſion of ſome ſtars about the pole, in order to find the latitude and hour of the night.

Some nocturnals are hemiſpheres, or planiſpheres, on the plane of the equinoctial. Thoſe commonly in uſe among ſeamen are two; the one adapted to the polar ſtar, and the firſt of the guards of the little bear; the other to the pole ſtar, and the pointers of the great bear.

This inſtrument conſiſts of two circular plates (plate XCIV. *fig.* 1.) applied to each other. The greater, which has a handle to hold the inſtrument, is about 2½ inches diameter, and is divided into twelve parts, agreeing to the twelve months, and each month ſubdivided into every fifth day; and ſo as that the middle of the handle correſponds to that day of the year wherein the ſtar here regarded has the ſame right aſcenſion with the ſun. If the inſtrument be fitted for two ſtars, the handle is made moveable.

The upper left circle is divided into twenty-four equal parts for the twenty-four hours of the day, and each hour ſubdivided into quarters. Theſe twenty-four hours are noted by twenty-four teeth, to be told in the night. Thoſe at the hour 12 are diſtinguiſhed by their length. In the center of the two circular plates is adjuſted a long index, A, moveable upon the upper plate. And the three pieces, viz. the two circles and index, are joined by a rivet which is pierced through the center with a hole, through which the ſtar is to be obſerved.

To uſe the NOCTURNAL, turn the upper plate till the long tooth, marked 12, be againſt the day of the month on the under plate: then, bringing the inſtrument near the eye, ſuſpend it by the handle with the plane nearly parallel to the equinoctial; and viewing the pole ſtar through the hole of the center, turn the index about till, by the edge coming from the center, you ſee the bright ſtar of guard of the little bear (if the inſtrument be fitted to that ſtar); then that tooth of the upper circle, under the edge of the index, is at the hour of the night on the edge of the hour-circle: which may be known without a light, by counting the teeth from the longeſt, which is for the hour 12.

NODATED HYPERBOLA, a name given by Sir Iſaac Newton to a kind of hyperbola, which, by turning round, decuſſates or croſſes itſelf.

NODE, *Nodus*, in ſurgery, a tumour ariſing on the bones, and uſually proceeding from ſome venereal cauſe; being much the ſame with what is otherwiſe called exoſtoſis. See EXOSTOSIS.

This word is more particularly applied to the tumours or protuberances ariſing on the joints of old gouty people, called alſo tophi. See TOPHI.

Some give the denomination of nodes, to all tumours formed by a coagulation of viſcous matter in the external parts of the body. See TUMOUR, &c.

NODES, in aſtronomy, the two points where the orbit of a planet interſects the ecliptic.

Such are the two points C and D (plate XCIV. *fig.* 2.) of which the node C, where the planet aſcends northward above the plane of the ecliptic, is called the aſcending node, or the dragon's head, and is marked thus ☊. The other node D, where the planet deſcends to the ſouth, is called the deſcending node, or the dragon's tail, marked thus ☋. And the right line D C is called the line of the nodes.

NODULE, or NODULUS, a word uſed in pharmacy, for a knot tied in a rag, and including ſome medicinal ingredients to be ſuſpended in any liquor, as beer or wine, to give it a tincture, or the like.

It ſignifies alſo a parcel of odoriferous ſimples, tied up in a piece of ſilk, for the patient to be frequently ſmelling to.

NODUS, or NODE, in dialling, a certain point or pole in the gnomon of a dial, by the ſhadow or light whereof, either the hour of the day in dials without furniture, or the parallels of the ſun's declination, and his place in the ecliptic, &c. in dials with furniture, are ſhewn.

NODUS is alſo uſed for a hole in the cieling of a room, or in the window, for making of a dial on the floor, wall, or the like.

NOETIANS, in church hiſtory, Chriſtian heretics in the third century, followers of Noetius, a philoſopher of Epheſus, who pretended that he was another Moſes, ſent by God; and that his brother was a new Aaron: his hereſy conſiſted in affirming that there was but one perſon in the godhead; and that the word and the holy ſpirit were but external denominations given to God, in conſequence of different operations; that as creator, he is called Father; as incarnate, Son; and as deſcending on the apoſtles, Holy Ghoſt.

NOLI ME NANGERE, *Touch me not*, in medicine, a malignant eruption in the face, occaſioned by an extremely ſharp corroſive humour; thus called, either becauſe it affects thoſe who touch it, or becauſe the more it is touched, the worſe it grows, and the farther it ſpreads.

NOMADES, in antiquity, a name given to ſeveral nations or people, whoſe whole occupation was to feed their flocks, and who had no fixed place of abode, but were conſtantly ſhifting, according to the conveniences of paſturage.

NOMANCY, a name given to the art of divining the fates of perſons, by means of the letters that form their names; being nothing elſe but the cabbaliſtic gematria.

NOMBRIL POINT, in heraldry, is the next below the feſs-point, or the very center of the eſcutcheon. See POINT.

NOME, or NAME, in algebra, denotes any quantity with a ſign prefixed or added to it, whereby it is connected with ſome other quantity, upon which the whole becomes a binomial, trinomial, or the like: thus $a+b$ is a binomial, $a+b+c$ is a trinomial, whoſe reſpective names or nomes are a and b for the firſt, and a, b, and c, for the ſecond. See BINOMIAL, &c.

NOMENCLATURE, *Nomenclatura*, a catalogue of ſeveral of the more uſual words in any language, with their ſignifications, compiled in order to facilitate the uſe of ſuch words to thoſe who are to learn the tongue: ſuch are our Latin, Greek, French, &c. nomenclatures.

NOMINALS, or NOMINALISTS, a ſect of ſchool philoſophers, the diſciples and followers of Occam, or Ocham, an Engliſh Cordelier, in the fourteenth century. They were great dealers in words, whence they were vulgarly denominated Word-ſellers; but had the denomination of Nominaliſts, becauſe that, in oppoſition to the Realiſts, they maintained that words, and not things, were the object of dialectics.

NOMINATION, the art of naming and appointing a perſon for ſome function, employ, or benefice.

NOMINATION, in law, ſignifies the power that a perſon has of appointing a clerk to a patron of a benefice, by him to be preſented to the ordinary.

NOMINATIVE, in grammar, the firſt caſe of nouns which are declinable. See the articles CASE and NOUN.

The ſimple poſition or laying down of a noun, or name, is called the nominative caſe; yet it is not ſo properly a caſe as the matter or ground, whence the other caſes are to be formed, by the ſeveral changes and inflections given to this firſt termination. Its chief uſe is to be placed in diſcourſe before all verbs, as the ſubject of the propoſition or affirmation.

NOMINATOR, he who preſents a perſon to an office or benefice; whence the perſon named, or preſented, is called nominee. See NOMINATION.

NON-ABILITY, in law, incapacity, or an exception taken againſt a plaintiff, in a cauſe, on ſome juſt ground, why he cannot commence a ſuit in law; as his being attainted of felony, outlawry, &c.

NON-AGE, in law, generally ſignifies all the time a perſon continues under the age of one and twenty; but in a ſpecial ſenſe it is all the time a perſon is under the age of fourteen. See AGE.

NON-APPEARANCE, a default in not appearing in a court of judicature. Attornies ſubſcribing warrants for appearing in court, are liable to attachment and fine for non-appearance. If a defendant does not appear, and find bail upon a *ſcire facias* and rule given, judgment may be had againſt him.

NON COMPOS MENTIS, in law, is uſed to denote a perſon's not being of ſound memory and underſtanding. Of theſe perſons there are four different kinds, an ideot, a madman, a lunatic who has lucid intervals, and a drunkard who deprives himſelf of reaſon by his own act and deed. In all theſe caſes, except the laſt, one that is non compos mentis ſhall not loſe his life for felony or murder; but the drunkard can have no indulgence on account of the loſs of his reaſon, for, in the eye of the law, his drunkenneſs does not extenuate but aggravate his offence.

NON-NATURALS, in medicine, ſo called becauſe by their abuſe they become the cauſes of diſeaſes. See the article DISEASE.

Phyſicians have divided the non-naturals into ſix claſſes, viz. the air, meats and drinks, ſleep and watching, motion and reſt, the paſſions of the mind, the retentions and excretions. See the articles AIR, MEATS, DRINKS, &c.

NON-RESIDENCE is particularly applied to ſpiritual perſons, who wilfully abſent themſelves for the ſpace of one month together, or two months at different times in the year, from their benefices; for which they are liable to penalties, by the ſtatute of non-reſidence: but biſhops, the king's chaplains, &c. are excepted.

NON-SUIT ſignifies the dropping of a ſuit or action, or a renouncing thereof by the plaintiff or defendant, which happens moſt commonly upon the diſcovery of ſome error in the plaintiff's proceedings, when the cauſe is ſo far proceeded in, that the jury is ready at the bar to deliver in their verdict.

A non-ſuit, it is ſaid, may be in the following caſes, viz. where a perſon brings a perſonal action, and does not proſecute it with effect; or if, upon the trial, he refuſes to ſtand a verdict, then he becomes non-ſuited; ſo where the plaintiff is not ready for trial at the calling and ſwearing of the jury, it is preſumed he does not ſtand to proceed in his cauſe, and on that account the court may call him non-ſuited. Likewiſe, on a trial, when the jury comes in to deliver their verdict, and when the plaintiff is called on to hear the ſame, in that caſe, if he does not appear after being thrice called by the crier of the court, he is non-ſuited; which non-ſuit is to be recorded by the ſecondary, by the direction of the court: but if he afterwards appears, before the non-ſuit is actually recorded, the court may take the verdict, for that is not a non-ſuit, till it be recorded, upon motion made by the counſel for this purpoſe; and then it is a part of the record, in the nature of a judgment againſt the plaintiff.

NONCONFORMISTS, the ſame with diſſenters. See DISSENTERS.

NONE, one of the ſeven canonical hours in the Romiſh church, anſwering to three o'clock in the afternoon.

NONES, *Nonæ*, in the Roman calendar, the fifth day of the months January, February, April, June, Auguſt, September, November, and December; and the ſeventh of March, July, and October. March, May, July, and October, had ſix days in their nones; becauſe theſe alone, in the ancient conſtitution of the year by Numa, had thirty-one days apiece, the reſt having only twenty-nine, and February thirty; but when Cæſar reformed the year, and made other months contain thirty-one days, he did not allot them ſix days of nones.

NORMAL-LINE, in geometry, is uſed for a perpendicular line, drawn to a tangent of a curve from the point of contact, and intercepted by the axis thereof. See PERPENDICULAR and SUBNORMAL.

NORROY, the title of the third of the three kings at arms.

NORTH, in cosmography, one of the four cardinal points. See COMPASS.

NORTHING, in navigation, the latitude made by a ship, in sailing towards the north-pole.

NORWAY, a kingdom of Europe, situated between the fourth and thirtieth degree of east long. and between the fifty-eighth and seventy-second of north lat. It is bounded by the Atlantic ocean on the north and west, by Swedish Lapland and other provinces of Sweden on the east, and by the sea called the Categate and Schaggerac on the south. It is a cold barren country, subject to Denmark.

NOSE, *Nasus*, in anatomy, may be divided two different ways; from their situation, into internal and external parts; and from their structure, into hard and soft parts.

The external parts are the root of the nose, the arch, the back, or spine of the nose, the sides of the nose, the tip of the nose, the alæ, the external nares, and the part under the septum.

The internal parts are the internal nares, the septum narium, the circumvolutions, the conchæ superiores, the conchæ inferiores, the posterior openings of the internal nares, the sinus frontales, sinus maxillares, sinus sphænoidales, the ductus lachrymales, and ductus palatini.

The firm or hard parts are mostly bony, and the rest cartilaginous; to these we may add the periosteum and perichondrium.

The soft parts are the integuments, muscles, sacculus lachrymalis, membrana pituitaria, vessels, nerves, and hairs of the nares.

The external nose is covered by the common integuments, the skin, epidermis, and fat. Those which cover the tip of the nose, and alæ narium, are a great number of glandular bodies, which Morgagni called glandulæ sebaceæ, the contents of which may easily be squeezed out by the fingers.

Six muscles are commonly reckoned to belong to the nose; two recti, called also pyramidales or triangulares; two obliqui or laterales, and two transversi, or myrtiformes. In very muscular bodies, there are likewise some supernumerary muscles, or small accessorii. The nose may also be moved in some measure by the muscles of the lips, which in many cases become assistants to the proper muscles of this organ.

The arteries of all these parts come from the external carotid. Those of the external parts of the nose are in general ramifications of the arteria maxillaris externa, or angularis, and of the temporalis; and the arteries of the internal parts are ramifications of the maxillaris interna.

The veins are almost in the same manner branches of the external jugular, and they communicate with the orbitary sinus, and by that means with the sinuses of the dura mater, and with the internal jugulars.

The principal nerves belonging to the nose are filaments of the newiolfactorii, which run down through the holes of the transverse lamina of the os ethmoides, and are distributed to the common membrane of the internal nares, especially to the villous portions thereof. The inner branch of the orbitary or ophthalmic nerve sends a filament through the internal anterior orbitary hole into the cranium, which comes out again in company with one of the filaments of the olfactory nerve through the ethmoidal lamina.

The internal branch advances afterwards towards the os unguis, and is distributed partly to the sacculus lachrymalis, the upper portion of the musculus pyramidalis, and of the integuments of the nose. The suborbitary nerve, having passed through the inferior orbitary hole, sends filaments to the lateral external parts of the nose. Another branch of the superior maxillary nerve goes to the posterior opening of the nares, being spent on the conchæ and other internal parts of the nose. The nose is the organ of smelling, by means of the villous portion of the internal membranes, to which the olfactory nerves are principally distributed. It is likewise of use in respiration; and the mucilaginous fluid, spread over the whole pituitary membrane, prevents the air from drying that membrane, and so rendering it incapable of being affected. The nose serves likewise to regulate and modify the voice; and to this the sinuses also contribute.

The sacculus lachrymalis receives the serum from the eyes, and discharges it upon the palate, whence the greatest part of it runs to the pharynx. *Winslow.*

Bleeding at the NOSE. See HÆMORRHAGE.

NOTARICON, the third part of the Jewish cabbala. See CABBALA.

NOTARY, *Notarius*, signifies a person usually some scrivener, who takes notes, or frames short draughts of contracts, obligations, charter parties, or other writings. At present we call him a notary public, who publicly attests deeds or writings, in order to make them authentic in another nation: but he is principally employed in business concerning merchants, as making protests of bills of exchange, &c. And noting a bill, is where he goes to take notice of a merchant's refusal to accept or pay the same. See BILL.

Ecclesiastical NOTARIES were officers in the first ages of the church, whose business it was to collect and preserve the acts of martyrs.

NOTATION, in arithmetic and algebra, the method of expressing numbers or quantities by signs or characters, appropriated for that purpose. See NUMERATION, ALGEBRA, CHARACTER, &c.

NOTE, *Nota*, is used for a character or abbreviature, serving to denote or express something in a little compass.

NOTE, in music, a character which marks the sound, that is, the elevation and falling of the voice, and the swiftness and slowness of its motions. In general under notes are comprehended all the signs or characters used in music, though in propriety the word only implies the marks which denote the degrees of gravity and acuteness to be given to each sound. See CHARACTER.

NOTE is likewise used for a mark made in a book or writing where there occurs something remarkable and worthy of particular notice: as also for an observation or explication of some passage in an author added in the margin, at the bottom of the page, or elsewhere, by an editor, in which sense it stands contradistinguished to text. The notes make the principal difference in the editions of classic, &c. authors. We have Virgil, Horace, Terence, &c. with Dacier's notes, Dauphin's notes, notes variorum, &c.

NOTE is also a minute, or short writing, containing some article of business, in which sense we say, promissory note, note of hand, bank note, &c.

NOTE *of a fine*, in law, an abstract of the fine or contract made by the chirographer, before the same is engrossed.

NOTHÆ CASTÆ, in anatomy, the five lowest ribs on each side. They are called bastard or spurious ribs, in regard they do not join with the breast-bone as the other ribs do; nor are they, like the rest, bony, but cartilaginous. See RIBS.

NOTHING, *Nihil.* The schoolmen distinguish between nothing taken strictly, being that which is impossible, or implies a contradiction, and nothing taken more generally, being applied both to what is possible and impossible. Again, they distinguish nothing into negative, which is the absence of reality in any subject; and privative, which is the absence of reality in a subject capable thereof, or wherein it ought to be found.

NOTHUS, νοθος, signifies spurious or bastard, whence it is figuratively applied by physicians, &c. to such diseases, as though in respect of a similitude of symptoms, &c. they have the same denomination as some others, yet are of a different origin, seat, or the like, from the same.

NOTICE, in law, is defined to be the making of something known, which a man might be ignorant of before: and it has divers effects in our laws; for thereby the party giving the same, may reap a benefit which he otherwise should not have had; and by this means the person to whom it is given, is liable to some charge or action, to which without it he had not been subject.

NOTION, in logic, an idea or representation of any thing in the mind. See IDEA.

NOVALE, in our ancient customs, signifies land newly

newly ploughed, that had not been tilled before in the memory of man. Novale is alſo ſometimes uſed for fallow land.

NOVATIONS, a Chriſtian ſect which ſprang up in the third century, ſo called from Novatian, a prieſt of Rome, or Novatus, an African biſhop, who ſeparated from the communion of pope Cornelius, whom Novatian charged with a criminal lenity towards thoſe who had apoſtatized during the perſecution of Decius. He denied the church's power of remitting mortal ſins, upon the offender's repentance; and at laſt went ſo far as to deny that the apoſtles could ever hope for pardon even from God himſelf. Novatus coming to Rome, joined with the followers of Novatian, and added to theſe rigid doctrines another, which was the unlawfulneſs of ſecond marriages, againſt which this became as ſevere as againſt apoſtates; denying communion to ſuch as married a ſecond time after baptiſm, and treating widows who married again, as adultereſſes. The two leaders were proſcribed and declared heretics, not for excluding penitents from communion, but for denying that the church had the power of remitting ſins.

NOVEL, in the civil law, a term uſed for the conſtitutions of ſeveral emperors, as of Juſtin, Tiberius, Leo, and more particularly of thoſe of Juſtinian. The conſtitutions of Juſtinian were called novels, either from their producing a great alteration in the face of the ancient law, or becauſe they were made on new caſes, and after the reviſal of the ancient code, compiled by order of that emperor. Thus the conſtitutions of the emperors Theodoſius, Valentinian, Marcian, &c. were alſo called novels, on account of their being publiſhed after the Theodoſian code.

NOVEL, in matters of literature, a fictitious hiſtory of a ſeries of ſurprizing and entertaining events in common life, wherein the rules of probability are or ought to be ſtrictly preſerved; in which it differs from a romance, where the hero and heroine is ſome prince and princeſs, and the events which lead to the cataſtrophe, are in general highly abſurd and unnatural.

NOVEL ASSIGNMENT, in law, an aſſignment of time, place, or the like, in an action of treſpaſs, otherwiſe than it was before aſſigned.

NOVEMBER, in chronology, the eleventh month of the Julian year, conſiſting only of thirty days: it got the name of November, as being the ninth month of Romulus's year, which began with March. See MONTH and YEAR.

NOVICE, in general, denotes a perſon not yet ſkilled or experienced in any art or profeſſion.

NOUN, *Nomen*, in grammar, a name or word expreſſing the thing ſpoken of, as king, queen, prince, &c.

Beſides the particular name which each perſon bears, he gives himſelf another when he ſpeaks of himſelf, as I or myſelf; the former are called nouns, and the latter pronouns. Nouns are again divided into nouns-ſubſtantive, and nouns-adjective.

They are called ſubſtantives, when the objects they expreſs are conſidered ſimply in themſelves, as ſoul, &c. and adjectives, when their objects are conſidered as clothed with any qualities, as vicious ſoul, &c.

Nouns are alſo divided into proper and appellative; nouns proper are thoſe which expreſs a particular thing or perſon, ſo as to diſtinguiſh it from all others of the ſame kind, as Ariſtotle, &c.

Nouns appellative are thoſe common to ſeveral individuals of the ſame kind, as man, beaſt, fiſh, &c.

NOWED, in heraldry, ſignifies knotted, from the Latin *nodatus*; being applied to the tails of ſuch creatures as are very long, and ſometimes repreſented in coat-armour, as if tied up in a knot.

NUCIFEROUS, in botany, is applied to ſuch trees as bear nuts.

NUCKIANÆ GLANDULÆ, in anatomy, a number of ſmall glands, ſituate between the abducent muſcle of the eye, and the upper part of the os jugale. See EYE, GLAND, &c.

NUCLEUS, in general, denotes the kernel of a nut, or even any ſeed incloſed within a huſk.

The term nucleus is alſo uſed for the body of a comet, otherwiſe called its head. See the article COMET.

Among the ancient architects, nucleus ſignified the middle flooring, which conſiſted of a ſtrong cement, over which they laid the pavement bound with mortar.

NUDITIES, in painting and ſculpture, denotes thoſe parts of an human figure which are not covered with any drapery; or thoſe parts where the carnation appears.

NUL TIEL RECORD, in law, is what the plaintiff generally pleads on the defendant's pleading matter of record in bar of the action brought by the plaintiff.

NULLITY, in law, ſignifies any thing that is null or void: thus there is a nullity of marriage, where perſons marry within the degrees, or where infants marry without conſent of their parents or guardians.

NUMBER, *Numerus*, in arithmetic, an aſſemblage of ſeveral units, or things of the ſame kind.

Stevinus defines number as that by which the quantity of any thing is expreſſed; agreeably to which Sir Iſaac Newton conceives number to conſiſt in the abſtract ratio of a quantity of any kind to another quantity of the ſame kind, which is accounted as unity; and on this view he divides number into integers, fractions, and ſurds.

Wolfius defines number to be ſomething which refers to unity, as one right line refers to another. Thus aſſuming a right line for unity, a number may likewiſe be expreſſed by a right line. A leſs general definition will not, he thinks, comprehend the ſeveral kinds of whole numbers, fractions, rationals, and ſurds. Mathematicians, conſidering number under a great many relations, have eſtabliſhed the following diſtinctions.

Broken NUMBERS are the ſame with fractions. See FRACTION.

Cardinal NUMBERS are thoſe which expreſs the quantity of units, as 1, 2, 3, 4, &c. whereas ordinal numbers are thoſe which expreſs order, as 1ſt, 2d, 3d, &c.

Compound NUMBER, one diviſible by ſome other number beſides unity; as 12, which is diviſible by 2, 3, 4, and 6. Numbers, as 12 and 15, which have ſome common meaſure beſides unity, are ſaid to be compound numbers among themſelves.

Cubic NUMBER is the product of a ſquare number by its root: ſuch is 27, as being the product of the ſquare number 9, by its root 3. All cubic numbers whoſe root is leſs than 6, being divided by 6, the remainder is the root itſelf: thus $27 \div 6$ leaves the remainder 3, its root; 216, the cube of 6, being divided by 6, leaves no remainder; 343, the cube of 7, leaves a remainder 1, which, added to 6, is the cube root; and 512, the cube of 8, divided by 6, leaves a remainder 2, which, added to 6, is the cube root. Hence the remainders of the diviſions of the cubes above 216, divided by 6, being added to 6, always gives the root of the cube ſo divided, till that remainder be 5, and conſequently 11, the cube-root of the number divided. But the cubic number above this being divided by 6, there remains nothing, the cube-root being 12. Thus the remainders of the higher cubes are to be added to 12, and not to 6; till you come to 18, when the remainder of the diviſion muſt be added to 18; and ſo on *ad infinitum*.

Determinate NUMBER is that referred to ſome given unit, as a ternary or three: whereas an indeterminate one is that referred to unity in general, and is called quantity.

Homogeneal NUMBERS are thoſe referred to the ſame unit; as thoſe referred to different units are termed heterogeneal.

Whole NUMBERS are otherwiſe called integers. See INTEGER.

Rational NUMBER is one commenſurable with unity; as a number, incommenſurable with unity, is termed irrational or a ſurd. See the article SURD.

In the ſame manner a rational whole number is that whereof unity is an aliquot part; a rational broken number, that equal to ſome aliquot part of unity; and a rational mixed number, that conſiſting of a whole number and a broken one.

Even NUMBER, that which may be divided into two equal parts without any fraction, as, 6, 12, &c. The ſum, difference, and product of any number of even numbers, is always an even number.

An evenly even NUMBER is that which may be meaſured, or divided, without any remainder, by another even number, as 4 by 2.

An unevenly even NUMBER, when a number may be equally divided by an uneven number, as 20 by 5.

Uneven NUMBER, that which exceeds an even number, at leaſt by unity, or which cannot be divided into two equal parts, as 3, 5, &c.

The ſum or difference of two uneven numbers makes an even number; but the factum of two uneven ones makes an uneven number.

If an even number be added to an uneven one, or if the one be ſubtracted from the other, in the former caſe the ſum, in the latter the difference, is an uneven number; but the factum of an even and uneven number is even.

The ſum of any even number of uneven numbers is an even number; and the ſum of any uneven number of uneven numbers is an uneven number.

Primitive or *Prime* NUMBERS are thoſe only diviſible by unity, as 5, 7, &c. And prime numbers among themſelves are thoſe which have no common meaſure beſides unity, as 12 and 19.

Perfect NUMBER, that whoſe aliquot parts added together, make the whole number, as 6, 28; the aliquot parts of 6 being 3, 2, and 1=6; and thoſe of 28, being 14, 7, 4, 2, 1, = 28.

Imperfect NUMBERS, thoſe whoſe aliquot parts, added together, make either more or leſs than the whole. And theſe are diſtinguiſhed into abundant and defective; an inſtance in the former caſe is 12, whoſe aliquot parts 6, 4, 3, 2, 1, make 16; and in the latter caſe 16, whoſe aliquot parts 8, 4, 2, and 1, make but 15.

Plain NUMBER, that ariſing from the multiplication of two numbers, as 6, which is the product of 3 by 2; and theſe numbers are called the ſides of the plane.

Square NUMBER is the product of any number multiplied by itſelf; thus 4, which is the factum of 2 by 2, is a ſquare number.

Every ſquare number added to its root makes an even number.

Polygonal, or *Polygonous* NUMBERS, the ſums of arithmetical progreſſions beginning with unity: theſe, where the common difference is 1, are called triangular numbers; where 2, ſquare numbers; where 3, pentagonal numbers; where 4, hexagonal numbers; where 5, heptagonal numbers, &c. See POLYGONAL.

Pyramidal NUMBERS. The ſums of polygonous numbers, collected after the ſame manner as the polygons themſelves, and not gathered out of arithmetical progreſſions, are called firſt pyramidal numbers: the ſums of the firſt pyramidals are called ſecond pyramidals, &c.

If they ariſe out of triangular numbers, they are called triangular pyramidal numbers; if out of pentagons, firſt pentagonal pyramidals.

Golden NUMBER, in chronology. See the article GOLDEN *Number*.

NUMBER, in grammar, a modification of nouns, verbs, &c. to accommodate them to the varieties in their objects, conſidered with regard to number. See the articles NOUN and VERB.

Nouns or names agreeing to ſeveral things, may be conſidered either as applied to one of thoſe things ſingularly, or to a number of them; and thoſe conſidered either as ſeveral, or as united. To diſtinguiſh theſe caſes, two numbers have been invented, the ſingular and plural.

When a noun indicates an object conſidered as ſingle, or alone, or a number of them conſidered as united together, it is ſaid to be of the ſingular number, as a plant, an army, a church. When it indicates ſeveral objects, and thoſe as diſtinct, it is of the plural number, as plants, armies, churches: and when I ſpeak of myſelf as making a part of ſeveral others, inſtead of ſaying I, it is proper to ſay we, &c.

The Greeks have a third number, which they call dual number, as ſignifying two: the Hebrews have ſomething like it; but then it only takes place when the words ſignify a thing double, either by nature, as the hands, eyes, &c. or by art, as ſciſſars, tongs, &c. As to common and appellative names, they ſeem all naturally to require a plural number, yet are there ſeveral which have none, as the name of gold, ſteel, &c.

The difference of numbers in nouns is expreſſed by a difference of termination. In Engliſh the ſingular is uſually converted into plural by adding s, as plant, plants; book, books, &c. Where the pronunciation requires it, as where the ſingular ends in s or x, ſh or ch, it is uſually done by the addition of es, inſtead of s. Very often the plural is formed by en, as from ox is formed the plural oxen; and from man, men; brother, brethren, &c. Thoſe nouns whoſe ſingulars end in f, or fe, form the plural by ves; as calf, calves; loaf, loaves; wife, wives, &c. However, the formation of the plural of many words can be reduced to no rule at all, being mere irregulars; as from mouſe is formed the plural mice; from foot, feet, &c. And in many words there is no difference of number; as in ſheep, deer, &c. Again, ſome words have no ſingular numbers; as aſhes, bellows, lungs, breeches, &c. and others no plural; as the names of countries, virtues and vices, metals, herbs, and corn. The plurals of adjectives, though varied from the ſingular in moſt languages, yet in Engliſh are generally the ſame.

NUMBERS, in poetry, oratory, muſic, &c. are certain meaſures, proportions, or cadences, which render a verſe, period, or ſong, agreeable to the ear. See the article METRE.

Poetical numbers conſiſt in a certain harmony in the order, quantities, &c. of the feet and ſyllables, which make the piece muſical to the ear, and fit for ſinging, for which all the verſes of the ancients were intended. See MEASURE and RYTHMUS.

Book of NUMBERS, the fourth book of the Pentateuch, taking its denomination from its numbering the families of Iſrael.

A great part of this book is hiſtorical, relating to ſeveral remarkable paſſages in the Iſraelites march through the wilderneſs. It contains a diſtinct relation of their ſeveral movements from one place to another, or their two and forty ſtages through the wilderneſs, and many other things, whereby we are inſtructed and confirmed in ſome of the weightieſt truths that have immediate reference to God and his providence in the world. But the greateſt part of this book is ſpent in enumerating thoſe laws and ordinances, whether civil or ceremonial, which were given by God, but not mentioned before in the preceding books.

NUMERAL LETTERS, thoſe letters of the alphabet which are generally uſed for figures.

NUMERAL CHARACTERS. See the article CHARACTER.

NUMERALS, in grammar, thoſe words which expreſs numbers.

NUMERATION, *Numeratio*, in arithmetic, the art of eſtimating or pronouncing any number.

The characters whereby numbers are ordinarily expreſſed are the nine following, 1, 2, 3, 4, 5, 6, 7, 8, 9.

That theſe nine numerical notes may expreſs not only units, but alſo tens, hundreds, thouſands, &c. they have a local value given them; ſo that when either alone, or when placed in the right-hand place, they denote units; in the ſecond place, tens; in the third, hundreds; in the fourth, thouſands.

To expreſs any number, it is to be divided by commas into claſſes, allowing three characters for each, and beginning at the right hand. Over the right hand figure of the third claſs add a ſmall mark, over the right hand figure of the fifth claſs add two marks, over that of the ſeventh, three, &c. The number to the left of the firſt comma expreſs by thouſands; that which has over it the firſt tranſverſe line expreſs by millions; that which has two by billions; that with three by trillions, &c. Laſtly, the left-hand character of each claſs expreſs by hundreds; the middle one by tens; and the right-hand one by units. For inſtance, 2‴, 345 389″, 210 762′, 321 543, is thus read, two trillions, three hundred and forty-five thouſand three hundred eighty-nine millions of billions, two hundred and ten thouſand ſeven hundred and ſixty-two millions, three hundred and twenty one thouſand five hundred and forty-three.

NUMERATOR *of a Fraction*. See the article FRACTIONS.

NUMERICAL, NUMEROUS, or NUMERAL, ſomething belonging to numbers; as numerical algebra is that which makes uſe of numbers inſtead of letters of the alphabet. Alſo numerical difference is the difference whereby one individual is diſtinguiſhed from another. Hence a thing is ſaid to be numerically the ſame, when it is ſo in the ſtricteſt ſenſe of the word.

NUMISMATOGRAPHIA, a term uſed for the deſcription and knowledge of ancient medals and coins, whether of gold, ſilver, or braſs.

NUN, a woman, in ſeveral Chriſtian countries, who devotes herſelf, in a cloiſter or nunnery, to a religious life. See MONK.

There were women in the ancient Chriſtian church, who made public profeſſion of virginity before the monaſtic life was known in the world, as appears from the writings of Cyprian and Tertullian. Theſe, for diſtinction's ſake, are ſometimes called eccleſiaſtical virgins, and were commonly enrolled in the canon or matricula of the church. They differed from the monaſtic virgin chiefly in this, that they lived privately in their father's houſes, whereas the others lived in communities; but their profeſſion of virginity was not ſo ſtrict as to make it criminal in them to marry afterwards, if they thought fit. As to the conſecration of virgins, it had ſome things peculiar in it: it was uſually performed publicly in the church by the biſhop. The virgin made a public profeſſion of her reſolution, and then the biſhop put upon her the accuſtomed habit of ſacred virgins. One part of this habit was a veil called the ſacrum velamen, another was a kind of mitre or coronet worn upon the head. At preſent, when a woman is to be made a nun, the habit, veil, and ring of the candidate are carried to the altar, and ſhe herſelf, accompanied by her neareſt relations, is conducted to the biſhop, who, after maſs and an anthem, the ſubject of which is, "that ſhe ought to have her lamp lighted, becauſe the bridegroom is coming to meet her," pronounces the benediction: then ſhe riſes up, and the biſhop conſecrates the new habit, ſprinkling it with holy-water. When the candidate has put on her religious habit, ſhe preſents herſelf before the biſhop, and ſings, on her knees, *ancilla Chriſti ſum, &c.* then ſhe receives the veil, and afterwards the ring, by which ſhe is married to Chriſt; and laſtly, the crown of virginity. When ſhe is crowned, an anathema is denounced againſt all who ſhall attempt to make her break her vows. The ſeveral orders of nuns in the Romiſh and Greek churches, are mentioned under ſeparate articles.

NUNCIO, or NUNTIO, an ambaſſador from the pope to ſome Catholic prince or ſtate, or a perſon who attends on the pope's behalf at a congreſs, or an aſſembly of ſeveral ambaſſadors.

NUNCUPATIVE, in the ſchools, ſomething that is only nominal, or has no exiſtence but in name.

NUNCUPATIVE WILL denotes a laſt will or teſtament, only made verbally, and not put in writing. See WILL and TESTAMENT.

NUNDINAL, NUNDINALIS, a name which the Romans gave to the eight firſt letters of the alphabet uſed in their calendar.

NUPTIAL RITES, the ceremonies attending the ſolemnization of marriage, which are different in different ages and countries. See MARRIAGE.

NURSERY, or NURSERY GARDEN, is a piece of land ſet a-part for the raiſing and propagating of all ſorts of trees and plants to ſupply the garden and other plantations.

Of this ſort there are great numbers in the different parts of this kingdom, but particularly in the neighbourhood of London, which are occupied by the gardeners, whoſe buſineſs it is to raiſe trees, plants, and flowers for ſale; and in many of theſe there is at preſent a much greater variety of trees and plants cultivated than can be found in any other part of Europe. In France, their nurſeries (which are but few, when compared with thoſe in England) are chiefly confined to the propagation of fruit-trees, from whence they have the appellation of pepinier: for there is ſcarce any of thoſe gardens, where a perſon can be ſupplied either with ever-greens, flowering ſhrubs, or foreſt-trees. And, in Holland, their nurſeries are principally for flowers; ſome few of them indeed propagate tender exotic plants. But thoſe nurſeries in the neighbourhood of London do, ſeveral of them, include all theſe; and from hence moſt of the curious perſons abroad are ſupplied with furniture for their gardens. But I do not propoſe, in this place, to treat of theſe extenſive nurſeries, or to give a deſcription of them; therefore ſhall confine myſelf to treat of ſuch nurſeries only as are abſolutely neceſſary for all lovers of planting to have upon the ſpot, where they deſign to make their plantation: for if theſe are large, the expence of carrying a great number of trees, if the diſtance is great, will be no ſmall article, beſides the hazard of their growing; which, when plants have been trained up in good land, and removed to an indifferent one, is very great. Therefore it is of the utmoſt conſequence to every planter, to begin by making of a nurſery. But in this article I muſt beg leave to obſerve, that a nurſery ſhould not be fixed to any one particular ſpot: I mean by this, that it would be wrong to continue the raiſing of trees any number of years upon the ſame ſpot of ground: becauſe hereby the ground will be ſo much exhauſted by the trees, as to render it unfit for the ſame purpoſe. Therefore all good nurſery-gardeners ſhift and change their land, from time to time; for when they have drawn off the trees from a ſpot of ground, they either plant kitchen herbs, or other things, upon the ground for a year or two, by which time, as alſo by dunging and trenching of the land, it is recovered, and made fit to receive other trees. But this they are obliged to from neceſſity, being confined to the ſame land; which is not the caſe with thoſe gentlemen who have a large extent of ground in the country. Therefore all ſuch perſons I would adviſe to make nurſeries upon the ground which is intended for planting, where a ſufficient number of the trees may be left ſtanding, after the others have been drawn out, to plant in other places; which, for all large growing trees, but particularly ſuch as are cultivated for timber, will be found by much the moſt advantageous method: for all thoſe trees which come up from the ſeed, or which are tranſplanted very young into the places where they are deſigned to remain, will make a much greater progreſs, and become larger trees than any of thoſe which are tranſplanted at a greater age. Therefore the nurſeries ſhould be thinned early, by removing all thoſe trees which are intended for other plantations, while they are young; becauſe hereby the expence and trouble of ſtaking, watering, &c. will be ſaved, and the tree will ſucceed much better. But in expoſed ſituations, where there are nurſeries made, it will be neceſſary to permit the trees to ſtand much longer, that, by growing cloſe together, they may ſhelter each other, and draw themſelves up: and theſe ſhould be thinned gradually, as the trees advance; for by taking away too many at firſt, the cold will check the growth of the remaining trees. But then thoſe trees which are taken out from theſe nurſeries, after a certain age, ſhould not be depended on for planting; and it will be prudence rather to conſign them for fuel, than by attempting to remove them large, whereby, in endeavouring to get them up with good roots, the roots of the ſtanding trees will be often much injured.

What has been here propoſed, muſt be underſtood for all large plantations in parks, woods, &c. but thoſe nurſeries which are only intended for the raiſing of ever-greens, flowering ſhrubs, or plants which are deſigned to embelliſh gardens, may be confined to one ſpot, becauſe a ſmall compaſs of ground will be ſufficient for this purpoſe. Two or three acres of land, employed this way, will be ſufficient for the moſt extenſive deſigns; and one acre will be full enough for thoſe of moderate extent. And ſuch a ſpot of ground may be always employed for ſowing the ſeeds of foreign trees and plants; as alſo, for raiſing many ſorts of biennial and perennial flowers, to tranſplant into the borders of the pleaſure-gardens; and for raiſing many kinds of bulbous-rooted flowers from ſeeds, whereby a variety of new ſorts may be obtained annually, which will recompenſe for the trouble and expence, and will moreover be an agreeable diverſion to all

those persons who delight in the amusements of gardening.

Such a nursery as this should be conveniently situated for water; for where that is wanting, there must be an expence attending the carriage of water in dry weather. It should also be as near the house as it can with conveniency be admitted, in order to render it easy to visit at all times of the year; because it is absolutely necessary, that it should be under the inspection of the master; for unless he delights in it, there will be little hopes of success. The soil of this nursery should also be good, and not too heavy and stiff; for such land will be very improper for sowing most sorts of seeds; because, as this will detain the moisture in the spring and winter, so the seeds of most tender things, especially of flowers, will rot in the ground, if sown early. Therefore, where persons are confined to such land, there should be a good quantity of sand, ashes, and other light manures buried in order to separate the parts, and pulverise the ground; and if it is thrown up in ridges, to receive the frost in winter, it will be of great use to it; as will also the frequent forking or stirring of the ground, both before and after it is planted.

The many advantages which attend the having such a nursery, are so obvious to every person who has turned his thoughts in the least to this subject, that it is needless for me to mention them here; and therefore I shall only beg leave to repeat here what I have frequently recommended, which is, the carefully keeping the ground always clear from weeds; for if these are permitted to grow, they will rob the young trees of their nourishment. Another principal business is, to dig the ground between the young plants at least once a year, to loosen it for the roots to strike out; but if the ground is stiff, it will be better to be repeated twice a year, viz. in October and March; which will greatly promote the growth of the plants, and prepare their roots for transplanting. *Miller's Gardiner's Dict.*

NUSANCE, in law, a thing done to the annoyance of another.

Nusances are either public or private: a public nusance is an offence against the public in general, either by doing what tends to the annoyance of all the king's subjects, or by neglecting to do what the common good requires; in which case all annoyances and injuries to streets, highways, bridges, and large rivers; as also disorderly ale-houses, bawdy-houses, gaming-houses, stages for rope-dancers, &c. are held to be common nusances. A private nusance is when only one person or family is annoyed, by the doing of any thing; as where a person stops up the light of another's house, or builds in such a manner that the rain falls from his house upon his neighbours; as likewise the turning or diverting water from running to a man's house, mill, meadow, &c. stopping up a way that leads from houses to lands; suffering a house to decay, to the damage of the next house; erecting a brew-house in any place not convenient; or an house of office, &c. so near another person's house as to offend him by its smell.

Indictment lies for a public or common nusance at the king's suit, whereon the party offending shall be fined and imprisoned; but no action can be brought in this case except one man suffers more by a common nusance than another; as where a pit is dug in the highway, and he falls into it. Action on the case, or assise of nusance, lies for any private nusance, at the suit of the party aggrieved, and on such actions judgment is given that the nusance shall be removed, and the injured party recover damages; but if a person has only a term of years in a house or lands, as he has no freehold therein, he can only have an action on the case, by which the nusance will be removed without his recovering damages.

NUT, *Nux*, among botanists, denotes a pericarpium of an extraordinary hardness, including a kernel or seed. Of these there are several kinds, as filberts, walnuts, &c.

NUTATION, in astronomy, a kind of tremulous motion of the axis of the earth, whereby, in each annual revolution, it is twice inclined to the ecliptic, and as often returns to its former position.

Sir Isaac Newton observes, that the moon has the like motion, only very small, and scarce sensible.

NUTMEG, *nux moschata*, in natural history, the kernel of a large nut, produced by a tree said to resemble the pear tree, growing in the East-Indies. The outer part of the fruit is a soft fleshy substance like that of the walnut, which spontaneously opens when ripe; under this lies a red membrane called mace, forming a kind of reticular covering through the fissures of which is seen the hard woody shell that includes the nutmeg. Two sorts of this kernel are distinguished; one of an oblong figure, called male; the other roundish or of the shape of an olive, called female; this last is the officinal species, being preferred to the other on account of its stronger and more agreeable flavour, and its being, as is said, less subject to become carious. The nutmegs are cured, according to Rumphius, by dipping them in a somewhat thick mixture of lime and water, that they may be every where coated with the lime, which contributes to their preservation.

The nutmeg is a moderately warm, grateful, unctuous spice; supposed to be particularly useful in weakness of appetite, and the nauseæ and vomitings accompanying pregnancy, and in fluxes; but liable, when taken too freely, to sit very uneasy on the stomach, and, as is said, to affect the head. Roasted with a gentle heat, till it becomes easily friable, it proves less subject to these inconveniences, and is supposed likewise to be more useful in fluxes.

Nutmegs, distilled with water, yield nearly one sixteenth their weight of a limpid essential oil, very grateful, possessing the flavour of the spice in perfection, and which is said to have some degree of an antispasmodic or hypnotic power: on the surface of the remaining decoction is found floating an unctuous concrete matter like tallow, of a white colour, nearly insipid, not easily corruptible; and hence recommended as a basis for odoriferous balsams: the decoction, freed from this sebaceous matter, and inspissated, leaves a weakly bitter subastringent extract. Rectified spirit takes up, by maceration or digestion, the whole smell and taste of the nutmegs, and receives from them a deep bright yellow colour: the spirit, drawn off by distillation from the filtered tincture, is very slightly impregnated with their flavour; greatest part of the specific smell, as well as the aromatic warmth, bitterishness and subastringency of the spice remaining concentrated in the extract. The essential oil, and an agreeable cordial water, lightly flavoured with the volatile parts of the nutmeg by drawing off a gallon of proof spirit from two ounces of the spice, are kept in the shops. Both the oil, and the spirituous tincture and extracts, agree better with weak stomachs than an equivalent quantity of the nutmegs in substance.

Nutmegs, heated, and strongly pressed, give out a fluid yellow oil, which concretes on growing cold into a sebaceous consistence. Rumphius informs us, that in the Spice Islands, when the nuts are broken, those kernels which appear damaged, carious, or unripe, are separated for this use, and that seventeen pounds and a quarter of such kernels yield only one pound of oil, whereas when the nutmeg is in perfection, it is said to afford near one third its own weight.

Two kinds of sebaceous matter, said to be expressed from the nutmeg, are distinguished in the shops by the name of oil of mace: the best sort, brought from the East-Indies in stone jars, is somewhat soft, of a yellow colour, and of a strong agreeable smell greatly resembling that of the nutmeg itself: the other comes from Holland in solid masses, generally flat, and of a square figure, of a paler colour, and much weaker smell. These oils are employed chiefly externally in stomachic plasters, and in anodyne and nervine unguents and liniments. They appear to be a mixture of the gross sebaceous matter of the nutmeg with a little of the essential or aromatic oil; both which may be perfectly separated from one another by maceration or digestion in rectified spirit, or by distillation with water. The spirituous tincture, and the distilled water, and the essential oil, are nearly similar to those drawn from the nutmeg itself, the pure white sebaceous substance being left behind.

NUTRITION, *Nutritio*, in the animal œconomy, the accession or apposition of new parts to the body, similar to those it already consisted of, either for its augmentation, or the reparation of such as are worn off.

Buffon,

Buffon, in order to account for nutrition, ſuppoſes the body of an animal, or vegetable, to be a kind of mould, in which the matter neceſſary to its nutrition is modelled and aſſimilated to the whole. But, continues he, of what nature is this matter, which an animal, or vegetable, aſſimilates to its own ſubſtance? What power is it that communicates to this matter the activity and motion neceſſary to penetrate this mould? and, if ſuch a force exiſt, would it not be by a ſimilar force that the internal mould itſelf might be reproduced?

As to the firſt queſtion, he ſhews, that there exiſts in nature an infinite number of living organical parts, and that all organized bodies conſiſt of ſuch organical parts; that their production coſts nature nothing, ſince their exiſtence is conſtant and invariable; ſo that the matter which the animal, or vegetable, aſſimilates to its ſubſtance, is an organical matter, of the ſame nature with that of the animal, or vegetable, which conſequently may augment its volume, without changing its form, or altering the quality of the ſubſtance in the mould.

As to the ſecond queſtion: there exiſt, ſays he, in nature, certain powers, as that of gravity, that have no affinity with the external qualities of the body, but act upon the moſt intimate parts, and penetrate them throughout, and which can never fall under the obſervation of our ſenſes.

And as to the third queſtion, he anſwers, that the internal mould itſelf is reproduced, not only by a ſimilar power; but it is plain that it is the very ſame power that cauſes the unfolding and reproduction thereof: for it is ſufficient, proceeds he, that, in an organized body that unfolds itſelf, there be ſome part ſimilar to the whole, in order that this part may one day become itſelf an organized body, altogether like that of which it actually is a part.

NUX MOSCHATA. See NUTMEG.

NUX PISTACHIA. See PISTACHIA.

NUX VOMICA, a flat, compreſſed, round fruit, about the breadth of a ſhilling, brought from the Eaſt-Indies.

It is found a certain poiſon to dogs, cats, &c. and it is not to be doubted but it would alſo prove fatal to mankind. Its ſurface is not much corrugated, and its texture is firm like horn, and of a pale, greyiſh, brown colour.

NYCHTHEMERON, *νυχθημερον*, the natural day, or day and night, which together always make twenty-four hours. See DAY and NIGHT.

NYCTALOPIA, in medicine, a two-fold diſorder of the eye, one of which is oppoſite to the other. In the firſt, the ſight is beſt in the night, and in obſcure places; whereas, in a clear light, their ſight fails, ſo that they can hardly ſee any thing. In the other ſort of nyctalopia, the patient can ſee nothing at all except in a clear and bright light.

As theſe infirmities ariſe from a natural bad formation of the eye; they are therefore incurable.

NYCTANTHES, Arabian Jaſmine, in botany, a genus of plants, the flower of which conſiſts of a ſingle ſaucer-like petal, with the limb divided into eight oblong ſegments: the fruit is a didymous, bilocular berry, with a large roundiſh ſeed in each cell.

NYMPH, in mythology, an appellation given to certain inferior goddeſſes, inhabiting the mountains, woods, waters, &c. ſaid to be the daughters of Oceanus and Tethys. All the univerſe was repreſented as full of theſe nymphs, which are diſtinguiſhed into ſeveral ranks or claſſes. The general diviſion of them is into celeſtial and terreſtrial; the former of which were called Uraniæ, and were ſuppoſed to be intelligences that governed the heavenly bodies or ſpheres. The terreſtrial nymphs, called Epigeiæ, preſided over the ſeveral parts of the inferior world, and were divided into thoſe of the water, and thoſe of the earth. The nymphs of the water were the Oceanitides, or nymphs of the ocean; the Nereids, the nymphs of the ſea; the Naiads and Ephydriades, the nymphs of the fountains; and the Limniades, or nymphs of the lakes. The nymphs of the earth were the Oreades, or nymphs of the mountains; the Napœæ, nymphs of the meadows; and the Dryads and Hamadryads, who were nymphs of the foreſts and woods. Beſides theſe, we meet with nymphs who took their names from particular countries, rivers, &c. as the Cithæroniades, ſo called from Mount Cithæron in Bœotia; the Dodonides, from Dodona; the Tiberiades, from the Tiber, &c.

Goats were ſometimes ſacrificed to the nymphs; but their conſtant offerings were milk, oil, honey, and wine.

NYMPH, among naturaliſts, that ſtate of winged inſects between their living in the form of a worm, and their appearing in the winged or moſt perfect ſtate.

The eggs of inſects are firſt hatched into a kind of worms, or maggots; which afterwards paſs into the nymph-ſtate, ſurrounded with ſhells or caſes of their own ſkins: ſo that, in reality, theſe nymphs are only the embryo-inſects, wrapped up in this covering; from whence they at laſt get looſe, though not without great difficulty.

During the nymph-ſtate, the creature loſes its motion. Swammerdam calls it nympha aurelia, or ſimply aurelia; and others give it the name of chryſalis, a term of the like import. See CHRYSALIS.

NYMPHÆ, in anatomy, two membranaceous parts, ſituated on each ſide the rima. They are of a red colour, and cavernous ſtructure, ſomewhat reſembling the wattles under a cock's throat. They are ſometimes ſmaller, ſometimes larger, and are continuous to the præputium of the clitoris, and joined to the interior ſide of the labia.

NYMPHÆA, the water-lilly, in botany, a genus of plants, the flower of which conſiſts of a number of petals, uſually fifteen: they are ſmaller than the cup, and are inſerted into the ſide of the germen in more than a ſingle ſeries: the fruit is an oval fleſhy berry, containing a great many roundiſh ſeeds.

NYMPHÆUM, in antiquity, a public hall magnificently decorated for banqueting, &c. where thoſe who wanted conveniencies at home, held their marriage feaſts, &c.

The word is derived from the Greek, *νυμφη*, a bride.

O.

OAK

O, The fourth vowel, and fourteenth letter of the alphabet.

The ſound of the *o* is formed by the breath flowing out of the mouth, through the cylindric concavity of the tongue, and round configuration of the lips.

The Greeks had two *o*'s, viz. Omicron (ο) and Omega (ω); the firſt pronounced upon the tip of the lips with a ſharper ſound, and the other in the middle of the mouth, with a fuller ſound, equal to *o o* in our language. The long and ſhort pronunciations of our *o* are equivalent to the two Greek ones; the firſt, as in *ſuppoſe*; the ſecond, as in *obey*. Among the Latins the *o* bore ſo great an affinity to the *a*, that they frequently confounded them, writing it *canſul*, and pronouncing it *conſul*.

O, among the ancients, was a numeral letter, ſignifying eleven; and when a daſh was added at the top, as Ō, it ſignified eleven thouſand.

OAK, a tree well known. It is one of the principal materials in building ſhips, &c. being ſtrong in all poſitions.

All the ſorts of oaks are propagated from acorns, which ſhould be ſown as ſoon as poſſible after they are ripe; for if they are kept too long out of the ground, they ſeldom grow.

The manner of ſowing theſe acorns, if deſigned for a ſmall plantation, or to be removed, is, to prepare ſome beds of freſh earth, neither too ſtrong and heavy, nor too light and dry; in theſe beds you ſhould place the acorns in rows one foot aſunder, and about two inches diſtance in the rows, covering them about two inches thick with the ſame freſh earth; obſerving to leave none of them uncovered, to entice the vermin, which may, in a ſhort time, deſtroy all the ſeeds.

In the ſpring, when the plants begin to appear, you muſt carefully clear them from weeds; and if the ſeaſon proves dry, you ſhould refreſh them now-and-then with a little water, which will greatly promote their growth. In theſe beds the plants ſhould remain until the following autumn, obſerving conſtantly to keep them clear from weeds; at which time you ſhould prepare a ſpot of good freſh earth, in ſize proportionable to the quantity of plants, which ſhould be trenched and levelled: then towards the middle or latter end of October, you ſhould carefully take up the plants, ſo as not to injure their roots, and plant them out in rows three feet aſunder, and eighteen inches diſtance plant from plant; obſerving never to ſuffer the plants to abide long out of the ground, becauſe their roots would dry, and endanger the growth of the plants.

When they are planted, you ſhould lay a little mulch upon the ſurface of the ground, near their roots, to prevent the earth from drying too faſt; and if the ſeaſon ſhould prove very dry, you ſhould give them a little water to ſettle the earth to their roots.

When the plants have taken root in this nurſery, they will require little more care than to keep them clear from weeds, and dig the ground between the rows every ſpring; in doing of which, you ſhould cut off ſuch roots as extend very far from the trunk of the trees, which will render them better for tranſplanting again: you ſhould alſo prune off ſuch ſide-branches as extend themſelves very far, and would retard the upright ſhoot; but you ſhould by no means cut off all the ſmall lateral branches, ſome of which are abſolutely neceſſary to be left on, to detain the ſap for the augmentation of the trunk; for I have often obſerved, where trees have been thus cloſely pruned, that their heads have overgrown their bodies, ſo that they have bent downward and become crooked.

When theſe trees have remained in the nurſery three or four years, they will then be large enough to tranſplant to the places where they are to remain; for it is not proper to let them grow very large before they are planted out; becauſe theſe are very hazardous trees to remove when old, or after they have taken deep root.

The ſeaſon for this work is, as I ſaid before, in the autumn; at which time, if they are carefully taken up, there will be little danger of their ſucceeding. When they are planted, the ſurface of the ground ſhould be mulched about their roots, to prevent its drying too faſt; and if the ſeaſon is very dry, they ſhould be watered, to ſettle the earth to their roots, which may be repeated two or three times in very dry weather; but you muſt carefully avoid giving them too much water, which is very injurious to theſe trees, when newly removed.

You ſhould alſo ſtake them to prevent their being ſhaken and diſturbed by the winds, which would retard their rooting. In tranſplanting of theſe trees, you ſhould by no means cut their heads, which is too much practiſed: all that ſhould be done, muſt be only to cut off any bruiſed or ill-placed branches, which ſhould be taken off cloſe to the place where they are produced: but there can be no greater injury done to theſe trees than to ſhorten their roots; for when the leading bud, which is abſolutely neceſſary to draw and attract the nouriſhment, is taken off, the branch often decays entirely, or, at leaſt, down to the next vigorous bud.

The trees, thus raiſed and managed, will, if planted in a proper ſoil, grow to a conſiderable magnitude, and are very proper for a wilderneſs in large gardens, or to plant in clumps in parks, &c. but if they are deſigned for timber, it is much the better method to ſow the acorns in the places where they are to remain; in order to which, you ſhould provide yourſelf in autumn with a ſufficient quantity of acorns, which ſhould be always taken from ſtraight, upright, vigorous-growing trees; theſe ſhould be gathered from under the trees as ſoon as may be after they are fallen, and, if poſſible, in a dry time, laying them thin in ſome open room to dry; after which they may be put in dry ſand, and preſerved in a dry place until the end of November, when you ſhould prepare the ground for planting them.

The directions here given are deſigned only for ſmall plantations in a garden or park, which are only for pleaſure: but where theſe trees are cultivated with a view to profit, the acorns ſhould be ſown where the trees are deſigned to grow; for thoſe which are tranſplanted will never grow to the ſize of thoſe which ſtand where they are ſown, nor will they laſt near ſo long ſound: for in ſome places, where theſe trees have been tranſplanted with the greateſt care, and they have grown very faſt for ſeveral years after, yet they are now decaying, when thoſe which remain in the place where they came up from the acorns, are ſtill very thriving, and have not the leaſt ſign of decay: therefore, whoever deſigns to cultivate theſe trees for timber, ſhould never think of tranſplanting them, but ſow the acorns on the ſame ground where they are to grow; for the timber of all thoſe trees which are tranſplanted, is not near ſo valuable as that of the trees from acorns. I ſhall therefore add ſome plain directions for the ſowing of acorns, and managing of the young trees, during their minority, until they are out of danger, and require no farther care.

The firſt thing to be done is that of fencing the ground very well, to keep out cattle, hares, and rabbits; for if either of theſe can get into the ground, they will ſoon deſtroy all the young trees. Indeed, they will in a few years grow to be out of danger from the hares and rabbits; but it will be many years before they will be paſt injury from cattle, if they are permitted to get into the plantation; therefore, durable fences ſhould be put round the ground. If, in the beginning, a pale fence is made about the land, which may be cloſe at the bottom, and open above; and within the pale a quick-hedge planted; this will become a good fence, by the time the pale decays, againſt all ſorts of cattle; and then the trees will have got above the reach of hares and rabbits, ſo that they cannot injure them; for the bark of the trees will be too hard for them to gnaw.

After the ground is well fenced, it ſhould be prepared, by plowing of it three or four times, and, after each plowing, to harrow it well, to break the clods, and cleanſe the ground from couch, and the roots of all bad weeds. Indeed, if the ground is green ſward, it will be better to have one crop of beans, peaſe, or turneps, off the ground, before the acorns are ſown, provided theſe crops are well hoed to ſtir the ſurface, and deſtroy the weeds: for if this is obſerved, the crop will mend and improve the land for ſowing; but in this caſe, the ground ſhould be plowed as ſoon as poſſible, when the crop is taken off, to prepare it for acorns; which ſhould be ſown as ſoon as may be after the acorns are ripe: for although theſe may be preſerved in ſand for ſome time, yet they will be apt to ſprout; and, if ſo, the ſhoots are in danger of being broken and ſpoiled; therefore I ſhould adviſe the ſowing early, which is certainly the beſt method.

In making choice of the acorns, all thoſe ſhould be preferred which are taken from the largeſt and moſt thriving trees: and thoſe of pollard trees ſhould always be rejected, though the latter are generally the moſt productive of acorns; but thoſe of the large trees commonly produce the ſtrongeſt and moſt thriving plants.

The ſeaſon for the ſowing of the acorns being come, and the ground having been plowed, and levelled ſmooth, the next work is to ſow the acorns; which muſt be done by drawing of drills acroſs the ground, at about four feet aſunder, and two inches deep; into which the acorns ſhould be ſcattered, at two inches diſtance. Theſe drills may be drawn either with a drill plough, or by hand, with an hoe; but the former is the moſt expeditious method, therefore in large plantations ſhould be preferred. In the drawing of the drills, if the land has any ſlope to one ſide, theſe ſhould be made the ſame way as the ground ſlopes, that there may be no ſtoppage of the wet by the rows of plants croſſing the hanging of the land. This ſhould be particularly obſerved in all wet ground, or where the wet is ſubject to lie in the winter. When the acorns are ſown, the drills ſhould be carefully filled in, ſo as to cover the acorns ſecurely; for, if any of them are expoſed, they will entice the birds and mice; and, if either of theſe once attack them, they will make great havock with them.

The reaſon of my directing the drills to be made at this diſtance, is for the more convenient ſtirring of the ground between the rows, to keep the young plants clean from weeds; for if this is not carefully done, it cannot be expected that the young plants ſhould make much progreſs; and yet this is generally neglected by many who pretend to be great planters, who are often at a large expence to plant, but ſeldom regard them after: ſo that the young plants have the difficulty to encounter the weeds, which frequently are four or five times the height of the plants, and not only ſhade and draw them, but alſo exhauſt all the goodneſs of the ground, and conſequently ſtarve the plants: therefore, whoever hopes to have ſucceſs in their plantations, ſhould determine to be at the expence of keeping them clean for eight or ten years after ſowing, by which time the plants will have obtained ſtrength enough to keep down the weeds: the neglecting of this has occaſioned ſo many young plantations to miſcarry, as are frequently met with in divers parts of England.

About the end of March, or beginning of April, the young plants will appear above ground; but before this, if the ground ſhould produce many young weeds, it will be good huſbandry to ſcuffle the ſurface over with Dutch hoes, in a dry time, either the latter end of March, or the beginning of April, to deſtroy the weeds, whereby the ground will be kept clean, until all the plants are come up ſo as to be plainly diſcerned; by which time it may be proper to hoe the ground over again; for by doing it early, while the weeds are ſmall, a man will perform more of this work in one day than he can in three or four, when the weeds are grown large: beſides, there will be great hazard of cutting off or injuring the young plants, when they are hid by the weeds; and ſmall weeds, being cut, are ſoon dried up by the ſun; but large weeds often take freſh root, and grow again, eſpecially if rain ſhould fall ſoon after, had then the weeds will grow the faſter for being ſtirred; therefore, it is not only the beſt method, but alſo the cheapeſt huſbandry, to begin cleaning early in the ſpring, and to repeat it as often as the weeds are produced.

The firſt ſummer, while the plants are young, it will be the beſt way to perform theſe hoeings by hand; but afterwards it may be done with the hoe-plough; for as the rows are four feet aſunder, there will be room enough for this plough to work; and as this will ſtir and looſen the ground, it will be of great ſervice to the plants; but there will require a little hand labour where the plough is uſed, in order to deſtroy the weeds, which will come up in the rows between the plants; for theſe will be out of the reach of the plough, and, if they are not deſtroyed, they will ſoon overgrow and tear down the young plants.

After the plants have grown two years, it will be proper to draw out ſome of them, where they grow too cloſe; but in the doing of this, great care ſhould be had not to injure the roots of thoſe left; for as the plants which are drawn out are only fit for plantations deſigned for pleaſure, ſo theſe ſhould not be ſo much regarded in their being removed, as to ſacrifice any of thoſe which are deſigned to remain. In the thinning of theſe plantations, the plants may, at the firſt time, be left about one foot aſunder, which will give them room enough to grow two or three years longer; by which time it may be eaſy to judge which are likely to make the beſt trees. Therefore theſe may be then fixed on, as ſtandards, to remain; though it will be proper to have a greater number at this time marked than can be permitted to grow, becauſe ſome of them may not anſwer the expectation: and, as it will be improper to thin theſe trees too much at one time, ſo the leaving double the number intended at the ſecond thinning will not be amiſs. Therefore, if they are then left at about four feet diſtance in the rows, they will have room enough to grow three or four years longer; by which time, if the plants have made good progreſs, their roots will have ſpread over the ground; therefore it will be proper to take up every other tree in the rows. But, by this, I do not mean to be exact in the removing, but to make choice of the beſt plants to ſtand, which-ever rows they may be in, or if they ſhould not be exactly at the diſtance here aſſigned: all that is deſigned here, is, to lay down general rules, which ſhould be

be as nearly complied with as the plants will permit: therefore every perſon ſhould be guided by the growth of the trees in the performance of this work.

When the plants have been reduced to the diſtance of about eight feet, they will not require any more thinning. But in two or three years time, thoſe which are not to remain will be fit to cut down, to make ſtools for underwood; and thoſe which are to remain, will have made ſuch progreſs as to become a ſhelter to each other; for this is what ſhould be principally attended to, whenever the trees are thinned; therefore, in all ſuch places which are much expoſed to the wind, the trees ſhould be thinned with great caution, and by ſlow degrees; for if the air is let too much at once into the plantation, it will give a ſudden check to the trees, and greatly retard their growth; but, in ſheltered ſituations, there need not be ſo great caution uſed as in thoſe places; the plants will not be in ſo much danger of ſuffering.

The diſtance which I ſhould chuſe to allow to thoſe trees which are deſigned to remain for timber, is, from twenty-five to above thirty feet, which will not be too near, where the trees thrive well; in which caſe their heads will ſpread, ſo as to meet in about thirty or thirty-five years: nor will this diſtance be too great, ſo as to impede the upright growth of the trees. This diſtance is intended that the trees ſhould enjoy the whole benefit of the ſoil. Therefore, after one crop of the underwood, or, at the moſt, two crops are cut, I would adviſe the ſtubbing up the ſtools, that the ground may be intirely clear, for the advantage of the growing timber, which is what ſhould be principally regarded: but, in general, moſt people have more regard for the immediate profit of the underwood than the future good of the timber, and, frequently, by ſo doing, ſpoil both: for, if the underwood is left after the trees have ſpread ſo far as that their heads meet, the underwood will not be of much worth; and yet by their ſtools being left, they will draw away a great ſhare of nouriſhment from the timber trees, and retard them in their progreſs.

The ſoil in which oak makes the greateſt progreſs, is a deeprich loam, in which the trees grow to the largeſt ſize; and the timber of thoſe trees which grow upon this land, is generally more pliable than that which grows on a ſhallower or drier ground; but the wood of the latter is much more compact and hard. Indeed there are few ſoils in England in which the oak will not grow, provided there is proper care taken in their cultivation; though this tree will not thrive equally in all ſoils: but yet it might be cultivated to a national advantage upon many large waſtes in many parts of England, as alſo to the great profit of the eſtates where theſe tracts of land now lie uncultivated, and produce nothing to the owner. And, ſhould the preſent temper of deſtroying the timber of England continue in practice ſome years longer, in the ſame degree which it has for ſome years paſt, and as little care be taken to raiſe a ſupply, this country, which has been ſo long eſteemed for its naval ſtrength, may be obliged to ſeek for timber abroad, or be content with ſuch a naval ſtrength as the poor remains of ſome frugal eſtates may have left growing: for, as to the large foreſts, from whence the navy has been ſo long ſupplied, a few years will put an end to the timber there: and how can it be otherwiſe, when the perſons to whoſe care theſe are committed, reap an advantage from the deſtruction of the timber? *Miller's Gard. Dict.*

OAK-*leaf Galls.*—Theſe are of ſeveral kinds; the remarkable ſpecies, called the muſhroom gall, is never found on any other vegetable ſubſtance but theſe leaves; and, beſides this, there are a great number of other kinds.

The double gall of theſe leaves is very ſingular, in that, as the generality of productions of this kind affect only one ſide of a leaf, or branch, and grow all one way, this kind of gall extends itſelf both ways, and is ſeen on each ſide of the leaf, in form of two protuberances, oppoſite the one to the other. Theſe are of differently irregular ſhapes, but their natural figure ſeems that of two cones, with broad baſes, and very obtuſe points, though, ſometimes, they are round, or very nearly ſo. Theſe make their firſt appearance on the leaf in April, and remain on till June, or longer. They are at firſt green, but afterwards yelloviſh, and are ſofter to the touch than many other of the productions of this kind: they are uſually about the ſize of a large pea, but ſometimes they grow to the bigneſs of a nut. When opened, they are found to be of that kind which are inhabited each by one inſect only, and each contains one cavity. The cavity in this is, however, larger than in any other gall of the ſize, even in many others of three times the ſize; the ſides of it being very little thicker than the ſubſtance of the leaf.

On opening theſe leaf galls, which are properly the habitation only of one animal, it is common to find two, the ſtronger preying upon the body of the other, and ſucking its juices, as it does thoſe of the leaf; often it is found wholly employed in devouring its unoffending neighbour at once: this is probably the caſe when its time of eating is nearly over: and, in fine, when we find the gall inhabited by only one inſect, or containing only one chryſalis, as it ought in its natural ſtate to do, we are never certain that this is the proper inhabitant, as it may be one of thoſe deſtroyers who has eaten up the other, and ſupplied its place. *Reaumur's Hiſt. Inſ.*

OAT, in huſbandry, a grain, of which there are ſeveral ſpecies, as the black, red, white, &c. and which are cultivated in the following manner.

Black oats are commonly ſown upon an etch crop, or on a lay, which they plough up in January, when the earth is moiſt, taking care to turn the turf well, and to lay it even and flat. Oats are to be ſown earlier in the northern parts of England than in the ſouthern.

Oats are ſown with a broad caſt, at twice, as they do barley, harrowing it well in; but this muſt always be harrowed the ſame way that the furrows lie of a lay, or but very little croſs, for fear of raiſing the turf; but upon an etch, as ſoon as the land is ploughed on an edge, they ſow and harrow it in once; then ſow it a ſecond time, the full quantity, and harrow it five or ſix times over, obſerving to harrow it once or twice acroſs, which breaks the clods, and covers the ſeed better than harrowing all one way. They commonly ſow them upon a broad ridge, which they give the land but one ploughing for. The uſual time for ſowing black oats is, in the beginning of February, or a very few weeks later, ſometimes not till the beginning of March: they are a hardy grain, and will bear any thing of wet or cold. Four buſhels of ſeed is the quantity for an acre; but they grow beſt on a moiſt land, though they will not miſs any where. The farmer knows that his oats are ripe when the ſtalks turn yellow, the grain feels hard, and the huſk begins to open, and ſhew the ſeed. After they are cut they ſhould lie for the dew and the rain to plump them, and make them threſh well; and, if weedy, to kill the weeds: but, if there happen much rain, they muſt be got in again as ſoon as dry, otherwiſe the oats will ſoon fall out of the huſks, and great part of the crop be loſt.

Red oats is a kind of corn very common in Staffordſhire, and ſome of the northern counties; it is a ſort of naked oat, and is very proper for making oat-meal, becauſe the kernel threſhes out of the hull, without carrying it to the mill, or drying of it. This oat is cultivated in the ſame manner as barley.

White oats is commonly ſown upon an etch, after wheat, rye, or barley; they only give the land one ploughing, and ſow them, and harrow them, as they do the black oats, except the land is ſubject to weeds; in that caſe, it is good to plough up the wheat, or rye ſtubble, in November, which will make it rot the better, and be a kind of winter fallowing. Only, if you have a very dry burning ground, which black oats will not delight in, they often in that caſe, ſow them upon a lay. March and April are the uſual time of ſowing white oats, and the drier the weather is when they are ſown, the better; they grow beſt upon a dry, gravelly, or ſandy land, and they are the beſt of all to be ſowed upon a land very ſubject to weeds, becauſe, being ſowed late, they allow a very little ploughing, and, growing very thick after this, they over-top the weeds ſooner than any other plant. White oats generally yield about the ſame quantity as thoſe of the black, that is, about twenty buſhels from an acre. *Mortimer's Huſbandry.*

Wild OAT, in huſbandry, a kind of oat, or oat-graſs, which comes up of itſelf, without ſowing, and is much

hated

hated and dreaded by the farmers. This, in many counties of England, is the greateſt of all hindrances of the good crops of barley, and often of other grain. It is a rough and hairy oat, and uſually black. In the wetter years, and after much froſt, this is found to be moſt troubleſome.

The beſt remedy the farmer has againſt this, is, to ſow the land moſt apt to produce it with beans, and when they are come up to about three inches high, to turn in ſheep upon the ground, about twenty ſheep to an acre; theſe will eat up all the ſhoots of the wild oat, and not touch the beans ſo long as there is any of the oat ſhoots left. *Moreton's Northampt.*

OATH, *Jusjurandum*, is a ſolemn affirmation, in which the perſons ſworn invoke the Almighty to witneſs that their teſtimony is true, renouncing all claim to his mercy, and calling for his vengeance if it be falſe.

OBADIAH, or *the Prophecy of* OBADIAH, a canonical book of the Old Teſtament, which is contained in one ſingle chapter, and is partly an invective againſt the cruelty of the Edomites, who mocked and derided the children of Iſrael, as they paſſed into captivity, and with other enemies, their confederates, invaded and oppreſſed thoſe ſtrangers, and divided the ſpoil amongſt themſelves: and partly a prediction of the deliverance of Iſrael, and of the victory and triumph of the whole church over her enemies.

OBELISK, in architecture, a truncated, quadrangular, and ſlender pyramid, raiſed as an ornament, and frequently charged either with inſcriptions or hieroglyphics.

Obeliſks appear to be of very great antiquity, and to be firſt raiſed to tranſmit to poſterity precepts of philoſophy, which were cut in hieroglyphical characters: afterwards they were uſed to immortalize the great actions of heroes, and the memory of perſons beloved. The firſt obeliſk mentioned in hiſtory was that of Rameſes king of Egypt, in the time of the Trojan war, which was forty cubits high. Phius, another king of Egypt, raiſed one of forty-five cubits; and Ptolemy Philadelphus, another of eighty-eight cubits, in memory of Arſinoe Auguſtus erected one at Rome in the Campus Martius, which ſerved to mark the hours on an horizontal dial, drawn on the pavement. They were called by the Egyptian prieſts the fingers of the ſun, becauſe they were made in Egypt alſo, to ſerve as ſtyles, or gnomons to mark the hours on the ground. The Arabs ſtill call them Pharaoh's needles, whence the Italians call them aguglia, and the French aiguilles.

The proportions in the height and thickneſs are nearly the ſame in all obeliſks; their height being nine, or nine and a half, and ſometimes ten times their thickneſs; and their diameter at the top never leſs than half, and never greater than three-fourths of that at the bottom.

OBELISK, †, in grammar, a mark in form of a dagger, uſed to refer the reader to a note in the margin, at the ſide or bottom of a page.

OBJECT, in philoſophy, ſomething apprehended, or preſented to the mind, by ſenſation or by imagination.

Chauvinus defines an object to be that about which a power, act, or habit is employed: thus, good is the object of the will, truth of the underſtanding; and, in like manner, colour is the object of ſight, ſound of hearing, &c.

Object is alſo uſed for the matter of art or ſcience, or that about which it is employed; in which ſenſe, it alſo coincides with ſubject.

OBJECT GLASS *of a Teleſcope*, or *Microſcope*, the glaſs placed at the end of the tube which is next the object. See the articles TELESCOPE and MICROSCOPE.

OBIT, among Chriſtians, a funeral ſolemnity, or office for the dead, moſt commonly performed when the corpſe lies in the church uninterred.

It likewiſe ſignifies the anniverſary office, or annual commemoration of the dead, performed yearly on the day of their death, with prayers, alms, &c.

OBLATI, in church hiſtory, were ſecular perſons, who devoted themſelves and their eſtates to ſome monaſtery, into which they were admitted as a kind of lay-brothers.

OBLATION, a ſacrifice, or offering made to God. See SACRIFICE.

OBLIGATION, in general, denotes any act whereby a perſon becomes bound to another, to do ſomething; as to pay a ſum of money, be ſurety, or the like.

OBLIQUE, in geometry, ſomething aſlant, or that deviates from the perpendicular. Thus an oblique angle, is either an acute or obtuſe one, i. e. any angle except a right one. See ANGLE.

OBLIQUE. ASCENSION, in aſtronomy. See the article ASCENSION.

OBLIQUE CASES, in grammar, are all the caſes except the nominative. See CASE.

OBLIQUE DESCENSION, in aſtronomy. See the article DESCENSION.

OBLIQUE LINE, that which, falling on another line, makes oblique angles with it, viz. one acute, and the other obtuſe.

OBLIQUE PERCUSSION, in mechanics. See the article PERCUSSION.

OBLIQUE PLANES, in dialling, are thoſe which recline from the zenith, or incline towards the horizon. See the articles DIAL and PLANE.

The obliquity, or quantity of this inclination, or reclination, may be found by means of a quadrant.

OBLIQUE SAILING, in navigation, is when a ſhip ſails upon ſome rhumb between the four cardinal points, making an oblique angle with the meridian; in which caſe, ſhe continually changes both latitude and longitude. See SAILING.

OBLIQUE SPHERE is where the pole is elevated any number of degrees leſs than 90°; in which caſe, the axis of the world, the equator, and parallels of declination will cut the horizon obliquely. See SPHERE.

OBLIQUITY *of the Ecliptic*. See ECLIPTIC.

OBLONG, in general, denotes a figure that is longer than broad: ſuch is a parallelogram, ellipſis, &c. See PARALLELOGRAM and ELLIPSIS.

OBOLUS, in antiquity, an ancient Athenian coin.

Among ancient phyſicians, obolus likewiſe denoted a weight, equal to ten grains.

OBSECRATION, in rhetoric, a figure whereby the orator implores the aſſiſtance of God, or man.

OBSEQUIES, the ſame with funeral ſolemnities. See BURIAL, FUNERAL, &c.

OBSERVATION, among navigators, ſignifies the taking the ſun's, or a ſtar's meridian altitude, in order thereby to find the latitude.

OBSERVATORY, a place deſtined for obſerving the heavenly bodies; being, generally, a building erected on ſome eminence, covered with a terrace for making aſtronomical obſervations.

OBSIDIONALIS, an epithet applied by the Romans to a ſort of crown. See CROWN.

OBSTRUCTION, in medicine, ſuch an obturation of the veſſels, as prevents the circulation of the fluids, whether of the ſound and vital, or of the morbid and peccant kind, through them, ariſing from an acceſs of the bulk of the fluid to be tranſmitted, above the capacity of the veſſel which ought to tranſmit it.

Such an obſtruction, then, proceeds either from the narrowneſs of the veſſels, or the exceſſive bulk of the fluids to be tranſmitted through them, or a concurrence of both theſe circumſtances. The narrowneſs of the veſſels is produced either by external compreſſion, the proper contraction of the veſſels themſelves, or an increaſed thickneſs in their membranes. The bulk of the molecules of the blood is increaſed by the viſcidity of the fluids, or by means of an error loci.

An obſtruction may alſo proceed from a narrowneſs of the veſſels in conjunction with the preternatural bulk of the molecules of the fluids.

The veſſels may be externally compreſſed, 1. By an adjacent tumour, either of the plethoric, inflamed, purulent, ſchirrous, cancerous, œdematous, encyſted, ſteatomatous, atheromatous, melicerous, hydatidic, aneuriſmatic, varicoſe, tophous, pituitous, calculous, or callous kind. 2. By fractures, luxations, diſtortions, or diſtractions of the harder parts of the body, compreſſing the flexible and pliant veſſels. 3. By every cauſe which preter-

ternaturally ſtretches and lengthens the veſſels, whether by a tumour, or the preſſure of a part when out of its natural ſituation, or by any external ſtretching force. 4. By external compreſſing cauſes, ſuch as too tight cloths, bandages, the weight of an incumbent body preſſing upon one particular part, and ligatures. This effect may alſo be produced by motion, attrition, and embracing other bodies; for when any part of the human body is moved againſt an hard obſtacle, the flexible veſſels are neceſſarily compreſſed. An increaſed contraction, eſpecially of the ſpiral fibres, and alſo of the longitudinal, leſſens the cavities of the veſſels; and this contraction ariſes firſt from every cauſe which increaſes the elaſtic force of the fibres, veſſels, and viſcera; ſecondly, from the tumour and preternatural diſtention of thoſe minute veſſels, by a contexture of which the ſides of the larger veſſels are formed; and thirdly, by a diminution of that cauſe which dilates the veſſels, whether for inſtance inanition, or a languid ſtate of the veſſels.

The thickneſs of the membranes of the veſſels is increaſed firſt by every tumour happening in thoſe veſſels, by the union and contexture of which the membranes are formed; and ſecondly, by calluſes, either of a cartilaginous, membranous, or bony nature, formed there.

The effects of an obſtruction are various, according to the diverſity of the obſtructed veſſel, and obſtructing matter. In the ſanguiferous arterial veſſels, an inflammation of the firſt kind happens; in the dilated lymphatic arterial veſſels, an inflammation of the ſecond kind; in the larger lymphatic veſſels, an œdema; in the ſmaller, pains without any apparent tumour; but in the pinguiferous, oſſeous, medullary, and biliary veſſels, other diſorders ariſe from an obſtruction.

When the different kinds of obſtructions are diſtinctly known, it is no difficult matter to find a cure adapted to each. For that ſpecies of obſtruction which ariſes from external compreſſion indicates the removal of the compreſſing cauſe, if poſſible. That ſpecies of obſtruction which ariſes from an increaſed contraction of the fibres may be removed, firſt, by ſuch medicines as correct the too great contraction of the fibres, veſſels, and viſcera; ſecondly, and more eſpecially, if their virtues have immediate acceſs to the part affected, which advantage is principally to be obtained by fomentations, fumigations, baths, and ointments; thirdly, by ſuch remedies as empty the too full veſſels compoſing the membranes. This intention is anſwered by evacuants, in general, but eſpecially by laxative, diluting, reſolvent, attenuating, deterſive, and evacuant medicines applied to the veſſels themſelves; and fourthly, by ſuch medicines as reſolve calloſities when formed.

The unfitneſs of the fluids for paſſing through the veſſels, which depends upon their loſing their ſpherical figure, may be known from an inveſtigation of its cauſes, which are for the moſt part ſubjected to the ſenſes. It is cured by ſuch remedies as reſtore the ſpherical figure of the globules of the blood. Of this kind are all thoſe things which increaſe the motion of the fluids through the veſſels and viſcera; ſuch as all ſtimulating and corroborating medicines, as alſo briſk motion.

As the concretion and inſpiſſation of the fluids ariſe from different cauſes, ſo it requires different methods of treatment, and different medicines, according to the various conditions of the patient. And this diverſity of cauſes, when inveſtigated, will diſcover the moſt proper medicines, and the beſt method of uſing them. In general, the concretion of humours is removed firſt by the reciprocal motion of the veſſels; ſecondly, by dilution; thirdly, by an attenuating fluid conveyed to the maſs of blood mixed with it, and circulating along with it; and fourthly, by removing the coagulating cauſe.

The reciprocal motion of the veſſels is procured firſt by ſuch remedies as diminiſh the diſtending cauſes, ſuch as veneſection; ſecondly, by ſuch medicines as corroborate the veſſels; thirdly, by friction and muſcular motion.

The cauſe which coagulates the fluids, is removed by the influence of ſtrongly attracting remedies; but when the fluids propelled into improper places become incapable of circulating, and by that means generate obſtructions, many and violent diſorders are produced; for which reaſon the ſource and cauſe from which they proceed ought to be carefully attended to. The cure is obtained, firſt by repelling the impacted matter with a retrograde motion into larger veſſels; ſecondly, by reſolving it; thirdly, by relaxing the veſſels; and fourthly, by ſuppuration.

The impacted motion is repelled with a retrograde motion, firſt by evacuating the fluid which acts upon the impacted matter by a liberal and ſudden veneſection, by which means the obſtructing matter is forced back by the effort of the contracted veſſel; and ſecondly, by friction performed from the extremities of the baſes of the veſſels.

OBTURATOR, in anatomy, a name for the two muſcles of the thigh, one of which is the marſupialis, and is called obturator internus, and the other the obturator externus. Theſe two muſcles ſhut up the foramen or aperture between the os pubis and the hip-bone. The obturator internus comes from the internal circumference of the hole that is between the iſchium and the os pubis; and paſſing through the ſinuoſity of the iſchium, it is inſerted into the dent of the great trochanter. Its tendon lies between the gemini: it turns the thigh to the outſide. The obturator externus comes from the external circumference of the ſame hole as the former; it embraces the neck of the thigh bone, and paſſes under the quadratus to the ſmall cavity of the great trochanter.

OBTUSE ſignifies blunt, dull, &c in oppoſition to acute, ſharp, &c. thus we ſay obtuſe angle, obtuſe angled triangle, &c. See ANGLE, &c.

OCCATION, a term in the ancient huſbandry, by which they expreſſed what we do by harrowing, though they performed it with a different inſtrument, being a kind of rake, with the teeth of which they levelled the ground, and broke the clods; and with the hand ſtrewed the corn over this level ground. Then they brought on the plough and ploughed it in, ſo that the grain was ſown in furrows, as we expreſs it, and uſually came up as we ſee it does at this time with us in the ſame caſe in the lower parts only. After it had got a few leaves they went over the ground again with the ſame inſtrument to clear away the weeds, and move the earth about the roots of the young plants.

OCCIDENT, in geography, the weſtward quarter of the horizon, or that part of the horizon where the ecliptic, or the ſun therein, deſcends into the lower hemiſphere, in contradiſtinction to orient. Hence we uſe the word occidental, for any thing belonging to the weſt, as occidental bezoard, occidental pearl, &c.

OCCIPITAL, in anatomy, a term applied to the parts of the occiput. See OCCIPUT.

OCCIPITALES, or the OCCIPITAL MUSCLES, ariſe on each ſide from the os occipitis, where it adheres to the temporal bones: they aſcend upwards over the oſſa bregmatis, and join their aponeuroſes with the frontal ones, to which they ſeem to afford their fixed point: they, together with the frontal ones, cover the head as it were with a helmet, or cap, and they aſſiſt their actions. Morgagni has obſerved, that theſe occipital muſcles are ſometimes entirely wanting, and at others, when not abſolutely deficient, that they are ſo thin that it is ſcarce poſſible to ſee them; ſometimes alſo they are larger than uſual, and are divided as it were each into two. It has been from an examination of them in ſome ſubject, in which they were of this kind, that Sanctorius makes two occipital muſcles of each ſide.

OCCIPITIS Os, the OCCIPITAL BONE, in anatomy, the fourth bone of the cranium, ſo called from its ſituation in the occiput, or back part of the ſkull. See the article SKULL.

Its figure reſembles a lozenge, irregularly notched, or indented; being convex on the outſide, and concave within. It is very thick, and has a protuberance about the middle of its convex ſide: it has alſo three apophyſes, two of which are condyloide, ſerving for its articulation with the upper vertebra of the neck, whereby the whole head is ſupported.

OCCIPUT, in anatomy, the hinder part of the head, or ſkull.

OCCULT, ſomething ſecret, hidden or inviſible. The occult ſciences are magic, necromancy, cabbala, &c.

Occult, in geometry, is uſed for a line that is ſcarce perceivable, drawn with the point of the compaſſes, or a leaden pencil. Theſe lines are uſed in ſeveral operations, as the raiſing of plans, deſigns of building, pieces of perſpective, &c. They are to be effaced when the work is finiſhed.

OCCULTATION, in aſtronomy, the time a ſtar or planet is hid from our ſight, by the interpoſition of the body of the moon, or of ſome other planet. See Eclipse.

Circle of Perpetual Occultation is a parallel in an oblique ſphere, as far diſtant from the depreſſed pole, as the elevated pole is from the horizon. See the article Horizon.

All the ſtars between this parallel and the depreſſed pole, never riſe, but lie conſtantly hid under the horizon of the place.

OCCUPANT, in law, the perſon that firſt ſeizes or gets poſſeſſion of a thing; and this by law muſt be of what has a natural exiſtence, as of land, &c.

OCCUPATION, in a legal ſenſe, is taken for uſe or tenure, as in deeds it is frequently ſaid, that ſuch lands are or lately were in the tenure or occupation of ſuch a perſon. This is likewiſe uſed for a trade, or myſtery.

Occupation, or Occupancy, in the civil law, denotes the poſſeſſion of ſuch things as at preſent properly belong to no private perſon; but are capable of being made ſo, as by ſeizing or taking of ſpoils in war, by catching things wild by nature, as birds and beaſts of game, &c. or by finding things before undiſcovered, or loſt by their proper owners.

OCEAN, in geography, that vaſt collection of ſalt and navigable waters in which the two continents, the firſt including Europe, Aſia, and Africa, and the laſt America, are incloſed like iſlands. The ocean is diſtinguiſhed into three grand diviſions. 1. The Atlantic ocean, which divides Europe and Africa from America, which is generally about three thouſand miles wide. 2. The Pacific ocean, or South-ſea, which divides America from Aſia, and is generally about ten thouſand miles over: and, 3. The Indian ocean, which ſeparates the Eaſt-Indies from Africa, which is three thouſand miles over. The other ſeas, which are called oceans, are only parts or branches of theſe, and uſually receive their names from the countries they border upon.

OCHLOCRACY, οχλοκρατεια, that form of government wherein the populace has the chief adminiſtration of affairs.

OCHRE, *Ochra*, in natural hiſtory, a genus of earths ſlightly coherent, and compoſed of fine, ſmooth, ſoft, argillaceous particles, rough to the touch, and readily diffuſible in water.

Ochres are of various colours, as red, yellow, blue, brown, green, &c. Of the red there are eleven ſpecies, of the yellow as many, of blue one, of brown two, of green one, and of black two. All which have, at one time or other, been uſed in painting.

The earths of this kind, uſed in medicine, are only three. 1. A yellow kind, deſcribed by Dioſcorides under the name of ochra Attica, and eſteemed a very valuable external medicine in inflammations and tumours, applied in form of a cataplaſm. 2 The deep red kind, called rubrica ſinopica, and ſaid to be an excellent aſtringent, and conſequently good in diarrhœas, dyſenteries, and hæmorrhages of all kinds. 3. The ſpecies of ochre, called lapis armenus. See Lapis.

OCIMUM, or Ochymum, baſil, in botany, a genus of plants, with a bilabiated cup: its flower is monopetalous and ringent: and its ſeeds, which are four in number, are contained in the cup, which cloſes for that purpoſe.

Both the herb and ſeeds of baſil are uſed in medicine, and are ſaid to be good in diſorders of the lungs, and to promote the menſes.

OCTAETERIDES, in chronology, denotes a cycle of eight years, at the end of which three entire lunar months were added.

This cycle was in uſe at Athens, till Meton diſcovered the golden number.

OCTAGON, or Octogon, in geometry, is a figure of eight ſides and angles; and this, when all the ſides and angles are equal, is called a regular octagon, or one which may be inſcribed in a circle. If the radius of a circle circumſcribing a regular octagon be $= r$, and the ſide of the octagon $= y$; then $y = \sqrt{2r^2 - r\sqrt{2r^2}}$.

Octagon, in fortification, denotes a place that has eight baſtions. See the article Fortification.

OCTAHEDRON, or Octaedron, in geometry, one of the five regular bodies, conſiſting of eight equal and equilateral triangles.

The word is compounded of the Greek οκτω, eight, and εδρα, a ſide.

The ſquare of the ſide of the octahedron is to the ſquare of the diameter of the circumſcribing ſphere, as 1 to 2.

If the diameter of the ſphere be 2, the ſolidity of the octahedron inſcribed in it will be 1,33333, nearly.

The octahedron is two pyramids put together at their baſes, therefore its ſolidity may be found by multiplying the quadrangular baſe of either of them, by one third of the perpendicular height of one of them, and then doubling the product.

OCTANDRIA, in botany, one of the claſſes of plants eſtabliſhed by Linnæus, the eighth in order; the characters of which are, that all the plants comprehended in it have hermaphrodite flowers, and eight ſtamina or male parts in each.

It is ſub-divided into orders, which are denominated from the number of piſtils contained in each flower: thus the octandria-monogynia contain eight ſtamina, and only one piſtil; the octandria-digynia, eight ſtamina, and two piſtils; and ſo on, trigynia, tetragynia, &c. denoting three, four, &c. piſtils.

OCTANT, or Octile, in aſtronomy, that aſpect of two planets, wherein they are diſtant an eighth part of a circle, or 45° from each other.

OCTATEUCH, an appellation given to the eight firſt books of the Old Teſtament. See the article Canon.

OCTAVE, in muſic, an harmonical interval, conſiſting of ſeven degrees, or leſſer intervals.

The moſt ſimple perception that we can have of two ſounds, is that of uniſons; in regard the vibrations there begin and end together. The next to this is the octave, where the more acute ſound makes preciſely two vibrations, while the grave or deeper one makes one; and wherein, by conſequence, the vibrations of the two meet at every vibration of the more grave one. Hence uniſon and octave paſs almoſt for the ſame concord: hence alſo the proportion of the two ſounds that form the octave are in numbers or in lines, as 1 : 2; ſo that two chords or ſtrings of the ſame matter, thickneſs, and tenſion, one whereof is double the length of the other, produce the octave.

Octave, in law, ſignifies the eighth day incluſive after any feaſt.

OCTILE, or Octant. See Octant.

OCTOBER, in chronology, the tenth month of the Julian year, conſiſting of thirty-one days: it obtained the name of October from its being the eighth month in the calendar of Romulus. See the article Month and Year.

OCTOSTYLE, in the ancient architecture, is the face of an edifice adorned with eight columns.

The eight columns of the octoſtyle may either be diſpoſed in a right line, as in the Pantheon, and the pſeudodiptere temple of Vitruvius; or in a circle, as in the round monothere temple of Apollo Pythius at Delphi, &c.

OCULUS, the eye, in anatomy. See Eye.

Oculus Beli, in natural hiſtory, one of the ſemi-pellucid gems, of a greyiſh white colour, variegated with yellow, and with a black central nucleus: it is of a roundiſh form, and its variegations very beautifully repreſent the pupil and iris of the eye; whence the name.

Oculus Cati. See Asteria.

Oculus Mundi, one of the ſemi-pellucid gems, of a whitiſh grey colour, without any variegations.

ODA, in the Turkiſh ſeraglio, ſignifies a claſs, order, or chamber. The grand ſignior's pages are divided into five claſſes or chambers. The firſt, which is the loweſt in dignity, is called the great oda, from the great number of perſons that compoſe it: theſe are the juniors, who are taught to read, write, and ſpeak the languages. The ſecond is called the little oda, where, from the age of fourteen or fifteen years, till about twenty, they are trained up to arms, and the ſtudy of all the polite learning the Turks are acquainted with. The third chamber, called kilar oda, conſiſts of two hundred pages, which, beſides their other exerciſes, are under the command of the kilardgi-bachi, and ſerve in the pantry and fruitery. The fourth conſiſts only of twenty-four, who are under the command of the khazineda-bachi, and have charge of the treaſure in the grand ſignior's apartment, which they never enter with cloaths that have pockets. The fifth is called kas-oda, or privy-chamber, and is compoſed of only forty pages, who attend in the prince's chamber. Every night eight of theſe pages keep guard in the grand ſignior's bed-chamber, while he ſleeps: they take care that the light, which is conſtantly kept in the room, does not glare in his eyes, leſt it ſhould awake him; and if they find him diſturbed with troubleſome dreams, they cauſe him to be awaked by one of their agas.

ODA-BACHI, or ODDOBASSI, among the Turks, an officer equivalent to a ſerjeant or corporal among us. The common ſoldiers and janizaries, called oldachis, after having ſerved a certain term of years, are always preferred, and made biquelars; and from being biquelars, they in time become oda-bachis; that is, corporals of companies, whoſe numbers are not fixed; being ſometimes ten, and ſometimes twenty.

Their pay is ſix doubles per month, and they are diſtinguiſhed by a large felt a foot broad, with two large oſtrich-feathers.

ODE, in poetry, a ſong, or compoſition proper to be ſung.

Among the ancients, odes ſignified no more than ſongs; but with us they are very different things. The ancient odes were generally compoſed in honour of their gods, as many of thoſe of Pindar and Horace.

Theſe had originally but one ſtanza, or ſtrophe, but afterwards they were divided into three parts, the ſtrophe, the antiſtrophe, and the epode. The prieſts going round the altar ſinging the praiſes of the gods, called the firſt entrance, when they turned to the left, the ſtrophe; the ſecond, turning to the right, they called antiſtrophe, or returning; and laſtly, ſtanding before the altar, they ſung the remainder, which they called the epode.

Heroes and triumphs were alſo ſubjects for the ode; and in courſe of time love and entertainments were likewiſe thought very ſuitable to it. Here Anacreon and Sappho excelled, and Horace has left us ſome of both ſorts wrote with peculiar ſweetneſs and elegance. Among the moderns, Dryden's ode on St. Cecilia's day, and Pope's on the ſame ſubject, are juſtly allowed to exceed every thing of the kind, either in this, or in any of the modern languages.

The diſtinguiſhing character of an ode is ſweetneſs; the poet is to ſoothe the minds of his readers by the variety of his verſe, and the delicacy of words; the beauty of numbers, and the livelineſs of expreſſions: for variety of numbers is eſſential to the ode. At firſt, indeed, the verſe of the ode was but of one kind, but for the ſake of pleaſure, and to adapt it to muſic, the poets ſo varied the numbers and feet, that their kinds are now almoſt innumerable. One of the moſt conſiderable is the Pindaric, diſtinguiſhed by its boldneſs, and the rapidity of its flights.

An ode may either be ſublime or of the lower ſtrain, jocoſe or ſerious, mournful or exulting, even ſometimes ſatirical, but never epigrammatical; and, in ſhort, it may conſiſt of wit, but not of that turn which is the peculiar characteriſtic of an epigram.

ODEUM, in Grecian antiquity, a muſic-theatre, built by Pericles, the inſide of which was filled with ſeats and ranges of pillars, and on the outſide the roof deſcended ſhelving downwards from a point in the center, with many bendings, in imitation of the king of Perſia's pavillion. Here the muſical prizes were contended for, and here alſo, according to Ariſtophanes, was a tribunal.

ODONTALGIA, the tooth-ach, in medicine. See TOOTH-ACH.

ODONTOIDE, in anatomy, an appellation given to a proceſs of the ſecond vertebra of the neck, from its reſemblance to a tooth.

ODOR, or ODOUR. See SMELL.

ODOROUS, or ODORIFEROUS, appellations given to whatever ſmells ſtrongly, whether they be fetid or agreeable; but chiefly to things whoſe ſmell is briſk, and agreeable.

ODYSSEE, *ὀδυσσεια*, a celebrated epic poem of Homer, wherein are related the adventures of Ulyſſes, in his return from the ſiege of Troy. See the articles EPIC and ILIAD.

The moral of the odyſſee is, that a perſon's abſence from home, ſo that he cannot have an eye to his affairs, occaſions great diſorders; and, accordingly, the hero's abſence is the principal and moſt eſſential action of the whole poem. This poem, adds Boſſu, is better calculated for the people than the Iliad, where the ſubjects ſuffer rather from the bad conduct of their princes, than by their own fault; whereas the meaneſt people are as liable to ruin their eſtates and families by negligence, as the greateſt princes; and, conſequently, have as much need of Homer's lectures, and are as capable of profiting by them as kings themſelves.

OECONOMICS, the art of managing the affairs of a family, or community; and hence the perſon who takes care of the revenues and other affairs of churches, monaſteries, and the like, is termed oeconomus.

OECONOMY, *οἰκονομια*, denotes the prudent conduct, or diſcreet and frugal management, whether of a man's own eſtate, or that of another.

Animal OECONOMY, the firſt branch of the theory of medicine; or that which explains the parts of the human body, their ſtructure and uſe, the nature and cauſe of life and health, and the effects, or phænomena ariſing from them.

OECUMENICAL, general or univerſal. As an oecumenical council, or ſynod; that is, one at which the whole Chriſtian church aſſiſted.

The word is Greek, and derived from *οἰκουμενη*, the habitable earth.

OEDEMA, or PHLEGMATIC TUMOUR, in medicine and ſurgery, a ſort of tumour attended with paleneſs and cold, yielding little reſiſtance, retaining the print of the finger when preſſed with it, and accompanied with little or no pain. See TUMOUR.

This tumour obtains no certain ſituation in any particular part of the body, ſince the head, eye-lids, hands, ſometimes part, ſometimes the whole body, is afflicted with it. When the laſt-mentioned is the caſe, the patient is ſaid to be troubled with a cachexy, leucophlegmatia, or dropſy. See CACHEXY, &c.

But if any part of the body is more ſubject to this diſorder than another, it is certainly the feet, which are at that time called ſwelled or oedematous feet. We ſhall treat diſtinctly of them in this place, that it may appear what is the true nature and rational method of phlegmatic tumours in whatever part of the body they ſhall be found.

The proximate cauſe of an oedema, ſays Heiſter, is doubtleſs to be found in the too great ſeroſity or viſcidity of the blood, which ſtagnates in the very minuteſt veſicles of the fat, or tunica celluloſa, and by this means ſtretches out the ſkin, with which it is immediately covered. This vitiated ſtate of the blood chiefly ariſes in men who are either of a cold and phlegmatic habit of body, or are advanced in years. It chiefly falls upon them in cold weather, or in the winter, when the inclemency of the ſeaſon heightens the diſorder of nature. Another cauſe of this diſorder is an irregularity in diet, by over-eating or drinking, and by the conſtant uſe of crude, cold, and hard meats. Intermitting fevers or agues conduce very much to this diſorder, eſpecially if the patient indulges himſelf in an intemperate uſe of cooling liquors, while the fit is upon him, and his thirſt urgent: the diſeaſe frequently owes its riſe to too plentiful a diſcharge of blood from a wound, the noſe, or any other way; and

ſometimes

ſometimes to obſtructions of the menſtrual diſcharge in women, or to a compreſſion of the vena cava by the weight of the fœtus in women far gone with child; or by any ſchirrhous body in the abdomen, which greatly hinders the return of the blood from the lower limbs; or to too ſedentary a way of life; or too great an indulgence in lying in bed; or laſtly, to a phthiſis and difficulty of breathing; or to any diſorder or fatigue of body, which diſturbs or deſtroys the natural force of the heart in maintaining the circulation with due vigour.

From what has been ſaid it plainly appears by what ſigns an oedema manifeſts itſelf; therefore this obſervation alone remains to be added, that the harder the tumour is, and the longer the pitting which is made by the finger remains viſible, the ſtagnating fluid is in ſuch proportion thicker, and more tenacious.

The method of treating oedematous tumours is very different, according to the different cauſes to which they owe their riſe: therefore we are firſt to make diligent ſearch after the genuine cauſe of the diſorder, before we attempt its cure. The external method of treating theſe tumours in the legs and feet, is uſually to have recourſe to frequent frictions with warm cloths, to be repeated evening and morning till the parts grow red and hot; then the limbs are to be diligently preſerved from the injuries of the cold air, by wearing ſtockings made of ſome warm fur, and at night keeping hot bricks about the legs and feet. After this there is a proper bandage to be applied, which is to aſcend gradually from the feet up to the knees. The firſt ſtep towards a cure by internal medicines, according to Junker, muſt be the correcting the mucous and viſcid ſtate of the humours by the neutral ſalts, as tartarum vitriolatum, and the like; and by gum ammoniacum, the roots of pimpernel, and woods of ſaſſafras, guaiacum, and the like; with the warm aromatics, as ginger and the ſpices, and carminative ſeeds; the matter when thus attenuated is to be evacuated by purges of a ſtrength proportioned to the conſtitution of the patients. After the uſe of theſe internal and the external medicines juſt before-mentioned, Heiſter thinks it proper to uſe ſtrengthening remedies externally; for which end the limb is to be placed over burning rectified ſpirits of wine, wrapping it up in cloths, in ſuch a manner as it may receive the ſteam. This will incline the ſtagnating fluids to eſcape through the ſkin, or render them fit to return into the circulation, and at the ſame time reſtore the natural tone of the limb.

OENANTHE, water-dropwort, in botany, a genus of plants, with a radiated flower; the leſſer hermaphrodite ones of the diſc being compoſed of five inflexo-cordated petals: the fruit is compoſed of two oblong ſeeds, convex and ſtriated on one ſide, and plain on the other.

A ſpecies of this plant, called the hemlock-dropwort, with all the leaves multifid and obtuſe, is a terrible poiſon.

OENAS, a name uſed by ſome authors for the wood-pigeon, or bluiſh columba, with a blackiſh ſpot on the wing.

ONELÆUM, in pharmacy, a mixture of wine and oil, uſually of a thick black wine and oil of roſes; ſaid to be good for anointing wounds, to prevent an inflammation.

OENOTHERA, the PRIMROSE of VIRGINIA, in botany, a genus of plants, the flower of which conſiſts of four obverſely cordated petals: the fruit is a cylindrical capſule, with four low angles, being formed of four valves, and containing four cells, with numerous angulated ſeeds.

OESOPHAGUS, in anatomy, the gula, or gullet, is a membranaceous canal, reaching from the fauces to the ſtomach, and conveying into it the food taken in at the mouth. Its figure is ſomewhat like that of a funnel, and its upper part is called by anatomiſts the pharynx. Its ſituation is almoſt exactly behind the aſpera arteria, and longitudinally with the vertebræ of the neck and back; but when it enters the cavity of the thorax, it turns a little to the right, on account of the aorta. Its ſubſtance is compoſed of five coats, of which the firſt is membranaceous, and is continuous with the pleura in the thorax. The ſecond is robuſt and muſcular; and, in the human body, is compoſed of a double ſtratum of fibres; thoſe of one ſeries longitudinal, and thoſe of the other circular. The third coat is cellular, much like that of the inteſtines. The fourth is nervous, and diviſible into a number of other lamellæ, and furniſhed with a multitude of glands and veſſels: hence it is divided by Verheyen into two, under the names of a vaſculous and glandulous coat: this is continuous with the interior membrane of the mouth and ſtomach. The fifth is villoſe, and is called cruſta villoſa: this is always covered with a mucous liquor.

The muſcles of the pharynx ſerve to open and ſhut the oeſophagus. See PHARYNX.

The arteries of the oeſophagus are from the carotids, the aorta, the intercoſtals, and the cœliac. The veins are from the jugulars, the azygos, and the coronary vein of the ſtomach; and the nerves from the par vagum. There are alſo certain excretory ducts, called ductus excretorii novæ Vercelloni, which ariſe from the glands, and convey a ſaltiſh liquor into the œſophagus and ſtomach. The glands, from which theſe have their origin, are of three kinds: 1. The gaſtric glands, which are conglomerate, and are ſituated near the left orifice of the ſtomach. 2. The dorſal ones, which are ſituated near the fifth vertebra of the thorax. And, 3. The bronchial, tracheal, and thyroide. The uſe of the oeſophagus is for deglutition, and a commixtion of the liquid ſerving for digeſtion.

OFFICE, a particular charge or truſt, or a dignity attended with a public function.

OFFICE alſo ſignifies a place or apartment appointed for officers to attend in order to diſcharge their reſpective duties and employments.

OFFICE, in architecture, denotes all the apartments appointed for the neceſſary occaſions of a palace or great houſe, as kitchens, pantries, confectionaries, &c.

OFFICE, in the canon-law, is uſed for a benefice that has no juriſdiction annexed to it.

OFFICER, a perſon poſſeſſed of a poſt or office.

Commiſſion-OFFICERS are thoſe appointed by the king's commiſſion: ſuch are all from the general to the cornet incluſive, who are thus denominated in contradiſtinction to warrant-officers, who are appointed by the colonel's or captain's warrant, as quarter-maſters, ſerjeants, corporals, and even chaplains and ſurgeons.

Field OFFICERS are ſuch as command a whole regiment, as the colonel, lieutenant-colonel, and major.

Flag-OFFICERS. See FLAG *Officers* and ADMIRALS.

General-OFFICERS are thoſe whoſe command is not limited to a ſingle company, troop or regiment; but extends to a body of forces, compoſed of ſeveral regiments: ſuch are the general, lieutenant-general, major-generals, and brigadiers.

OFFICERS *of Police* are thoſe in whom the government and direction of the affairs of a community are inveſted, as mayors, aldermen, ſheriffs, &c.

Royal OFFICERS are thoſe who adminiſter juſtice in the king's name, as the judges, &c. See the article JUDGE.

Sea OFFICERS, or OFFICERS *of the Marine*, are thoſe who command ſhips of war. See the article NAVY.

Staff-OFFICERS are ſuch as, in the king's preſence, bear a white ſtaff, or wand; and at other times, on their going abroad, have it carried before them by a footman bare-headed: ſuch are the lord ſteward, lord chamberlain, lord treaſurer, &c.

The white ſtaff is taken for a commiſſion, and at the king's death each of theſe officers breaks his ſtaff over the hearſe made for the king's body, and by this means lays down his commiſſion, and diſcharges all his inferior officers.

Subaltern OFFICERS are all who adminiſter juſtice in the name of ſubjects; as thoſe who act under the earl marſhal, admiral, &c. In the army, the ſubaltern officers are the lieutenants, cornets, enſigns, ſerjeants, and corporals.

OFFICIAL, in the canon-law, an eccleſiaſtical judge, appointed by a biſhop, chapter, abbot, &c. with charge of the ſpiritual juriſdiction of the dioceſe. Of theſe there are two kinds; the one is, as it were, the vicar general of the dioceſe, and is called by the canoniſts officialis principalis, and in our ſtatute-law, the biſhop's chancellor,

cellor. There is no appeal from his court to the biſhop, his being eſteemed the biſhop's court. See BISHOP'S COURT.

OFFICIAL is alſo a deputy appointed by an archdeacon, as his aſſiſtant, who ſits as judge in the archdeacon's court.

OFFICINAL, in pharmacy, an appellation given to ſuch medicines, whether ſimple or compound, as are required to be conſtantly kept in the apothecaries ſhops.

OFF-SETS, in gardening, are the young ſhoots that ſpring from the roots of plants; which, being carefully ſeparated, and planted in a proper ſoil, ſerve to propagate the ſpecies.

OFF-SETS, in ſurveying, are perpendiculars let fall, and meaſuring from the ſtationary lines to the hedge, fence, or extremity of an encloſure.

OGEE, or O. G. in architecture, a moulding, conſiſting of two members, the one concave, and the other convex; or, of a round and a hollow, like an S. See MOULDING and CYMATIUM.

OGIVE, in architecture, an arch, or branch of a Gothic vault; which, inſtead of being circular, paſſes diagonally from one angle to another, and forms a croſs with the other arches.

The middle, where the ogives croſs each other, is called the key; being cut in form of a roſe, or a cul de lampe.

The members or mouldings of the ogives are called nerves, branches, or reins; and the arches which ſeparate the ogives, double arches.

OIL, *Oleum*, in natural hiſtory, an unctuous inflammable matter drawn from ſeveral natural bodies, as animal and vegetable ſubſtances.

The word is formed from the Latin *oleum*, which is derived from *olea*, an olive-tree, the fruit of which abounds with oil.

The chymiſts call it ſulphur, being the ſecond of their hypoſtatical, and of the true five chemical principles. To this they attribute all the diverſity of colours, and all the beauty and deformity of bodies: probably their various odours in a great meaſure ariſe from it. It ſweetens the acrimony of ſalts; and by ſtopping, or filling up the pores of a mixed body, keeps it longer from corruption, where it abounds. And we find that the ever-greens, ſuch as box, holly, &c. abound more with oil than other plants.

There are two ſorts of oils; one of which ſeems to be mixed with ſpirit, for it can never be drawn pure, and which will ſwim upon water; ſuch as oil of anniſeeds, lavender, roſemary, &c. which the chemiſts call eſſential, and is commonly drawn in an alembic, with ſtore of water. And another kind, which probably is mixed with ſalts, and theſe will ſink in water; ſuch are the oils of ponderous woods, as guaiacum, box, cloves, &c.

There are ſome things which are very improperly called oils; as oil of tartar per deliquium, which is only a fixed ſalt diſſolved. Oil of vitriol, which is nothing but the moſt cauſtic and ſtrongeſt part of the ſpirit of vitriol. Oil of antimony, which is only a mixture of antimony and an acid ſpirit.

Oils are of two kinds, the one obtained by expreſſion, and the other by diſtillation.

The method of procuring oil by expreſſion from nuts, ſeeds, maſt, &c.

Take two pounds of ſweet almonds, blanched and beat ſmall in a ſtone mortar; wrap the maſs up in a piece of ſtrong thick canvas, and commit it to a ſtrong ſcrew preſs; when, being ſqueezed between two cold iron cheeks, it will gradually part with a conſiderable quantity of oil.

This method holds of all thoſe vegetable matters that contain a copious oil, in a looſe manner, or in certain cavities or receptacles; the ſides whereof being broke, or ſqueezed, makes them let go the oil they contain: and thus the zeſt or oil of lemon-peel, orange-peel, citron-peel, &c. may be readily obtained by preſſure, without the uſe of fire. But how far this method of obtaining oils may be applied to advantage, ſeems not hitherto conſidered. It has been commonly applied to olives, almonds, linſeed, rape-ſeed, beech-maſt, ben-nuts, walnuts, bay-berries, mace, nutmeg, &c. but not that we know of to juniper-berries, Caſhew-nuts, Indian cloves, pine-apples, and many other ſubſtances that might be enumerated, both of foreign and domeſtic growth. It has, however, been of late ſucceſsfully applied to muſtard-ſeed, ſo as to extract a curious gold-coloured oil, leaving a cake behind, fit for making the common table-muſtard.

Certain dry matters, as well as moiſt ones, may be made to afford oils by expreſſion, by grinding them into a meal, which, being ſuſpended to receive the vapour of boiling water, will thus be moiſtened ſo as to afford an oil, in the ſame manner as almonds; and thus an oil may be procured from linſeed, hemp-ſeed, lettuce ſeed, white poppy-ſeed, &c.

As to the treatment of oils, obtained by expreſſion, they ſhould be ſuffered to depurate themſelves by ſtanding in a moderately cool place, to ſeparate from their water, and depoſite their fæces; from both which they ought to be carefully freed. And if they are not thus rendered ſufficiently pure, they may be waſhed well with freſh water, then thoroughly ſeparated from it again, by the ſeparating-glaſs, whereby they will be rendered bright and clear.

Particular care muſt be had to keep ſuch of theſe oils cool as are deſigned for eating, or for any internal uſe; becauſe they are apt in a few days to turn rancid and corroſive with the heat of the ſummer's ſun, ſo as to prove very unwholeſome. Hence the phyſician and apothecary ſhould be curious that the oils given in pleuriſies and other diſtempers be freſh drawn from ſound ſubjects, no way tainted, or already turned rancid; as almonds, piſtachios, and other nuts are apt to do: and again, that theſe oils have felt no conſiderable heat, either by drawing or ſtanding long in a warm place: and the ſame caution ſhould likewiſe extend to animal oils, intended both for internal and external uſe; ſince theſe alſo become rancid, or change to a yellow, red, or grey colour in hot weather; and thus become exceedingly nauſeous and corroſive, as we ſee in butter, bacon, and other fat bodies; which then prove only fit for the tallow-chandler, or other ignoble uſes.

The ſame method is likewiſe applicable to the procuring oils or fats from certain animal bodies which contain much fat, being chopped ſmall, and, ſet in a pan over the fire, become fit for the canvas bag; and by preſſure afford a large quantity of fat, as we ſee in the art of chandlery; which, thus extracting the oily matter, leaves an hard cake, or what they commonly call graves, behind.

Theſe graves, and all the reſiduums of the preſent proceſs, after being ſqueezed ever ſo hard with the preſs, will ſtill afford a copious oil by boiling it in water; ſo that perhaps it might be made more profitable for the tallow-chandler to boil his graves for oil, as bones are uſually boiled for it, than to diſpoſe of them in the ordinary manner.

So likewiſe if the almonds remaining in canvas, after the expreſſion of their oil, be ground in a mortar with warm water, the water will thus extract the remaining oil, and turn therewith into a milky liquor or emulſion. And if this operation had been performed upon the almonds at firſt, before we committed them to the preſs, we might thus have diſſolved out all their oil, and left only a dry chaffy, or light huſky, and exhauſted matter behind. Whence we have a method of diſſolving oils in water, and thereby of making a kind of artificial milk, which by ſtanding will afford a cream, and turn ſour, like the milk of animals; which will not grow rancid with heat as oil. Whence ſuch emulſions may, in ſome caſes, be medicinally uſed, with greater ſafety and ſucceſs than expreſſed oils.

Any of theſe expreſſed oils will receive particular colours and odours, at the diſcretion of the artiſt. Thus, for example, if a little alkanet root be barely infuſed in olive oil, it gives a beautiful red colour to that oil, without altering its taſte; ſo again if a few drops of the eſſential oil of cinnamon be added to a pint of ſallad oil, ſuch ſallad oil may be rendered agreeable to thoſe who admire the flavour of cinnamon. And thus may oil, butter, &c. be diverſified, infinite ways, by a proper uſe of tingng ingredients and ſuitable chemical oils.

The ſame contrivance has likewiſe its uſes in making eſſences for the ſervice of the perfumer; not only where eſſential oils are procurable, but alſo where theſe either cannot well be obtained, or only in ſmall quantity. The eſſential oil of jaſmin flowers, honey-flowers, ſweet briar, damaſk roſes, lilies of the valley, &c. are either extremely dear, or ſcarce obtainable by diſtillation, and in ſome of them the odorous matter is ſo ſubtile as almoſt to be loſt in the operation. But if jaſmin flowers, damaſk roſes, lilies of the valley, &c. be barely infuſed in fine oil of nuts, oil of ben, drawn without heat, and kept in a cool place, the ſubtile odorous matter of the flowers will thus paſs into the oil, and richly impregnate it with their native and odoriferous ſpirit, which can ſcarce otherwiſe be procured, or ſeparated from the flowers, without loſs or debaſement. And theſe eſſences may be rendered perfect by ſtraining of the oil at firſt put on, and letting it ſtand again, without heat, upon freſh flowers; thus repeating this operation twice or thrice.

To conſider the thing attentively; we ſhall find that the eſſences thus obtained are a kind of eſſential oils, not greatly differing from thoſe prepared by diſtillation from the flowers, ſeeds, or barks of odoriferous vegetables; for all ſuch eſſential oils are found to be little more than the native odorous ſpirits of the vegetable ſubject, wrapped up, lodged, or entangled in an unctuous or direct oily ſubſtance. This oily ſubſtance indeed riſes or becomes vegetable by the heat of boiling water; but ſo do not the oils gained by expreſſion; whence the principal difference betwixt thoſe natural and artificial eſſential oils, as we may call them, ſeems to conſiſt in the different tenacity, volatility, or fixedneſs of their unctuous or direct oily parts; the native ſpirit appearing the ſame in both; though indeed, it is the more delicate and unimpaired in the artificial kind of eſſential oils, as not having here felt the force of fire. And hence, perhaps, ſome conſiderable improvements might be made in the arts of the oilman, perfumer, and apothecary; not to mention other œconomical uſes, and the art of the dairy.

The method of procuring eſſential oil is in the following manner.

Take eight pounds of juniper-berries, bruiſe them in a ſtone mortar, put them into a ſtill, along with four gallons of river water; and, working with a briſk fire, draw off a gallon of water, with it will be obtained a conſiderable proportion of a fragrant eſſential oil, which muſt be ſeparated from the water by a ſeparating glaſs.

This proceſs is applicable to the diſtilling of the eſſential oils from flowers, leaves, barks, roots, woods, gums, and balſams, with a ſlight alteration of circumſtances, as by longer digeſtion, briſker diſtillation, &c. according to the tenacity and hardneſs of the ſubject, the ponderoſity of the oil, &c.

Eſſential oils may be divided into two claſſes, according to their different ſpecific gravities; ſome floating upon water, and others readily ſinking to the bottom. Thus, the eſſential oils of cloves, cinnamon, and ſaſſafras, readily ſink; whereas thoſe of lavender, marjoram, mint, &c. ſwim in water: the lighteſt of theſe eſſential oils, is, perhaps, that of citron-peel, which even floats in ſpirit of wine; and the heavieſt ſeems to be oil of ſaſſafras. See the article GRAVITY.

For obtaining the full quantity of the more ponderous oils from cinnamon, cloves, ſaſſafras, &c. it is proper to reduce the ſubjects to powder; to digeſt this powder for ſome days in a warm place, with thrice its quantity of ſoft river-water, made very ſaline by the addition of ſea-ſalt, or ſharp with oil of vitriol; to uſe the ſtrained decoction, or liquor left behind in the ſtill, inſtead of common water, for freſh digeſtion; to uſe for the ſame purpoſe the water of the ſecond running, after being cleared of its oil; not to diſtil too large a quantity of theſe ſubjects at once; to leave a conſiderable part of the ſtill, or about one fourth empty; to uſe a briſk fire, or a ſtrong boiling heat, at the firſt, but to ſlacken it afterwards; to have a low ſtill-head, with a proper internal ledge and current leading to the noſe of the worm; and, finally, to cohobate the water, or pour back the liquor of the ſecond running upon the matter in the ſtill, repeating this once or twice.

Theſe cautions are all neceſſary, in order to diſtil the ponderous eſſential oils to profit and perfection. The phyſical reaſons whereon they depend may deſerve to be conſidered. 1. The reduction of the ſubject to powder expoſes all its parts the better to the action of the water and ſalt; whereby the oil is the more mollified, attenuated, and rendered fitter to riſe along with the aqueous vapour in diſtillation. 2. The digeſtion is requiſite for the ſame reaſon, as being no more than allowing time for this action to be performed in a moderate warmth. The water ſhould rather be the ſoft water of rivers than that of rain, which is more corruptive or fermentative; or, than of ſprings, which is often ſo hard as not to mollify the oil, but rather defend it from the action of the ſalt, or acid, which are added not only to prevent all tendency to fermentation or corruption, that would abſolutely change or deſtroy the oil; but, more particularly, as having the known property of attenuating, liquefying, diſſolving, and purifying groſs viſcous and tenacious oils. Beſides which, it likewiſe increaſes the ſpecific gravity of the water; whereby the ſubject is now buoyed up, ſo that it cannot readily touch the bottom of the ſtill, or come in the way of the fire to be ſcorched: and at the ſame time, this addition alſo increaſes the heat of the liquor, or makes it exceed that of mere boiling water, whence the aſcent of the oil is likewiſe promoted. 3. The ſtrained decoction is properly uſed inſtead of water, as being already ſaturated with oily particles; ſo that it cannot much rob the ſubject. And, 4. The ſame holds alſo of the water of the ſecond running, which neceſſarily contains ſome oily particles. 5. If too large a quantity of the ſubject be diſtilled at once, the heat will neceſſarily act unequally, or ſtrong upon ſome parts, and weak upon others; whence, as the oil is ſo extremely ponderous, a large part of it will be left behind in the ſubject. 6. If too much empty ſpace be left in the ſtill, it will be difficult for the ponderous oil to aſcend; and, if too intenſe a heat be uſed, it deſtroys the grateful odour of the oil without raiſing any conſiderable quantity; and, if the ſtill be filled too full, the matter will be apt to boil over and foul the oil. 7. The fire is ordered to be briſk at firſt, to prevent the oil, now in ſome meaſure ſeparated by the heat, from going back into the ſubject; but, after a part is thus come over, if the fire be not a little ſlackened, the oil is apt to ſcorch, and come out of the noſe of the worm, in the form of a ſmoke, that cannot be catched and condenſed; yet the whole operation needs not be long continued, or above two hours, becauſe the valuable part of the oil ſoon comes over. 8. If the head of the ſtill be not low, the ponderous oil will have too far to riſe; and, unleſs the oil be directed to the worm by a proper ledge and current, a conſiderable part will fall back into the ſtill, and ſo prolong the operation or leſſen the produce. 9. Laſtly, two or three cohobations or returns of the water upon the ſubject in the ſtill, muſt needs bring over all the oil that will any way riſe. And water, already ſomewhat impregnated with the oil, is manifeſtly better for the purpoſe, than ſuch as has never been uſed before.

Many of the eſſential oils being dear, it is a very common practice to adulterate or debaſe them ſeveral ways, ſo as to render them cheaper both to the ſeller and the buyer. Theſe ſeveral ways ſeem reducible to three general kinds, each of which has its proper method of detection, viz. 1. With expreſſed oils. 2. With alcohol. And, 3. With cheaper eſſential oils.

If an eſſential oil be adulterated with an expreſſed oil, it is eaſy to diſcover the fraud, by adding a little ſpirit of wine to a few drops of the ſuſpected eſſential oil, and ſhaking them together; for the ſpirit will diſſolve all the oil that is eſſential, or procured by diſtillation, and leave all the expreſſed oil that was mixed with it, untouched.

If an eſſential oil be adulterated with alcohol, or rectified ſpirit of wine, it may be done in any proportion, up to that of an equal quantity, without being eaſily diſcoverable, either by the ſmell or taſte: the way to diſcover this fraud, is to drop a few drops of the oil into a glaſs of fair water: and if the oil be adulterated with ſpirit, the water will immediately turn milky, and by continuing to ſhake the glaſs, the whole quantity of ſpirit will be abſorbed by the water, and leave the oil pure at top.

Finally,

Finally, if an eſſential oil be adulterated by a cheaper eſſential oil, this is commonly done very artfully: the method is to put fir-wood, turpentine, or oil of turpentine into the ſtill, along with the herbs to be diſtilled for their oil, ſuch as roſemary, lavender, origanum, &c. and, by this means, the oil of turpentine diſtilled from theſe ingredients comes over in great quantity, and intimately blended with the oil of the genuine ingredient. The oils thus adulterated always diſcover themſelves in time, by their own flavour being overpowered by the turpentine-ſmell; but the ready way to detect the fraud is to drench a piece of rag, or paper, in the oil, and hold it before the fire; for thus the grateful flavour of the plant will fly off, and leave the naked turpentine-ſcent behind.

The virtues of oils being the ſame with thoſe of the ſubſtances from whence they are obtained, may be learned under their ſeveral articles.

Oil is well known to ſtop the violent ebullition of various ſubſtances: thus, if ſugar, honey, &c. be boiling, and in danger of riſing over the ſides of the veſſel, the pouring in a little oil, makes it immediately ſubſide.

OIL-MILL, one that ſerves to bruiſe or break the nuts, olives, and other fruits and grains, whoſe juice is to be drawn by expreſſion, to make oil.

There are two different methods of expreſſing oils; one chiefly uſed in extracting oil from olives, &c. by means of a very ſtrong preſs, a deſcription of which the reader will find under the article PRESS.

The other, which is commonly called an oil-mill, is chiefly uſed for expreſſing oils from ſeeds, &c. we have given a perſpective view of on plate XCIII. where A is a large wheel turned either by water or horſes, the cogs of which work in the trundle-head B, and give motion to the large ſhaft H K. N, N, N, N, are lifting cogs, which raiſe the ſtampers O P, O P, &c. Q, Q, are larger lifting cogs, being intended to raiſe the ſtampers R R, S S, &c. to a much greater height than the former. T V, *c d*, are battens for guiding the ſtampers in their motion; and *a*, *b*, battens to which the catches are fixed for ſuſpending the ſtampers. The ſeeds are ground either in the mill repreſented in *fig.* 2, or pounded in the mortars *f*, *f*, *f*, *f*. When the ſeeds are thus thoroughly bruiſed, the maſh is taken out, and put into ſmall bags of hair lined with thin canvas. The bags thus filled are placed in the preſs at 1, 5, and the oil extracted by the force of wedges driven by the ſtampers S, S. 6, 4, 4, 7, are pieces of wood for filling up the vacuities when the bags are placed in the preſs. 3 is the wedge driven by the ſtamper S S, which forces the bags filled with the bruiſed ſeed into a leſs compaſs, and conſequently extracts the oil. When the ſeeds are ſufficiently preſſed, the ſtamper R R is raiſed, and by falling on the inverted wedge 2, the whole preſſure is removed, and the bags together with the wedge 3, eaſily taken out of the preſs. X Y repreſents the outſide of the preſs and mortars; and Z Æ, a ſection of both.

Fig. 2, is a mill for grinding the ſeeds. It conſiſts of two large ſtones moving on their edges in a circular bed. The mill is put in motion by means of the cog-wheel G, whoſe cogs play in the rounds of the lantern D. A B C D is a frame of wood for turning the ſtones *m*, *b*. *e k f* is a kind of hook for ſtirring the ſeeds while the ſtones revolve round their axis. The baſis L of the mill-bed is hollow, for receiving the oil preſſed out of the ſeeds in grinding.

OINTMENT, or UNGUENT, in pharmacy and ſurgery. See UNGUENT.

OLEA, the olive tree, in botany. See the article OLIVE.

OLEANDER, *nerium*, in botany. See the article NERIUM.

OLFACTORY NERVES, the firſt pair of the head; ſo called from their being the immediate inſtrument of ſmelling.

OLIBANUM, in pharmacy, a gummy-reſin brought from Turkey and the Eaſt-Indies, uſually in drops or tears, like thoſe of maſtich, but larger, of a pale yellowiſh colour, which by age becomes reddiſh. Of the tree which produces it we have no certain account.

This gummy reſin has a moderately ſtrong, not very agreeable ſmell, and a bitteriſh ſomewhat pungent taſte: in chewing, it ſticks to the teeth, becomes white, and renders the ſaliva milky. Laid on a red-hot iron, it readily catches flame, and burns with a ſtrong, diffuſive, not unpleaſant ſmell: it is ſuppoſed to have been the incenſe uſed by the ancients in their religious ceremonies, though it is not the ſubſtance now known by that name in the ſhops. On trituration with water, greateſt part of it diſſolves into a milky liquor, which on ſtanding depoſites a portion of reſinous matter, and, being now gently inſpiſſated, leaves a yellow extract, which retains the greateſt part of the ſmell as well as the taſte of the olibanum; its odorous matter appearing to be of a leſs volatile kind than that of moſt other gummy-reſins. Rectified ſpirit diſſolves leſs than water, but takes up nearly all the active matter: the tranſparent yellowiſh ſolution, inſpiſſated, yields a very tenacious reſin, in which the active parts of the juice are ſo inveloped and locked up, that they are ſcarcely to be diſcovered either by the ſmell or taſte.

Olibanum is recommended in diſorders of the head and breaſt, in hemoptoes, and the alvine and uterine fluxes: the doſe is from a ſcruple to a dram or more.

OLIGARCHY, a form of government, where the adminiſtration is lodged in the hands of a few people.

The word is Greek, ολιγαρχια, which is derived from ολιγος, a few, and αρχη, command, or government.

OLIO, or OGLIO, in cookery, denotes a ſavoury diſh compoſed of a great variety of ingredients, chiefly uſed by the Spaniards.

OLIVE, *Olea*, in botany, a genus of trees, with a monopetalous flower, divided into four ſegments at the limb; the leaves are for the moſt part oblong and evergreen: the ovary, which is fixed to the center of the flower-cup, becomes an oval, ſoft, pulpy fruit, abounding with a fat liquor, incloſing a hard rough ſtone.

There are five ſorts of olive-trees preſerved in the gardens of the curious, where they are planted either in pots or caſes, and removed into the green-houſe in the winter, with oranges, myrtles, &c. but they are moſt of them hardy enough to endure the cold of our ordinary winters in the open air, provided they are planted upon a dry ſoil, and in a warm ſituation, though in ſevere winters they are demoliſhed, or at leaſt loſe their heads, or are killed to the ſurface; but this is what they are liable to in the ſouth parts of France, in which country theſe trees abound; and yet in very ſharp winters are moſt of them deſtroyed. There was a parcel of theſe trees growing in the gardens of Camden-houſe, near Kenſington, a few years ſince, which were ſeven or eight feet high; and in ſome good ſeaſons produced very good fruit: theſe were planted againſt a ſouth wall, but were permitted to grow up rude without pruning, or faſtening to the wall, (which they do by no means care for;) and, during the time they were below the top of the wall, they throve very well; but, after their heads were got above the wall, the north winds uſually greatly prejudiced them every winter; and the hard winter, 1739-40, entirely demoliſhed them.

Theſe plants may be propagated by laying down of their tender branches, in the manner practiſed for other trees, which ſhould remain undiſturbed two years; in which time they will have taken root, and may be taken off from the old plants, and tranſplanted either into pots filled with freſh light earth, or into the open ground in a warm ſituation. The beſt ſeaſon for tranſplanting them is the beginning of April, when you ſhould, if poſſible, take the opportunity of a moiſt ſeaſon; and thoſe which are planted in pots ſhould be placed in a ſhady part of the green-houſe, until they have taken root; but thoſe planted in the ground ſhould have mulch laid about their roots, to prevent the earth from drying too faſt, and be now and then refreſhed with water; but you muſt by no means let them have too much moiſture, which will rot the tender fibres of their roots, and deſtroy the trees.

When the plants have taken freſh root, thoſe in the pots may be expoſed to the open air, with other hardy exotics; with which they ſhould be houſed in winter, and treated as myrtles, and other leſs tender trees and ſhrubs; but thoſe in the open air will require no farther care until the winter following, when you ſhould mulch the ground about their roots, to prevent the froſt from penetrating

netrating deep into them: and, if the froſt ſhould prove very ſevere, you ſhould cover them with mats, which will defend them from being injured thereby; but you muſt be cautious not to let the mats continue over them after the froſt is paſt, leſt, by keeping them too cloſe, their leaves and tender branches ſhould prove mouldy for want of free air, which will be of as bad conſequence to the trees, as if they had been expoſed to the froſt, and many times worſe; for it ſeldom happens, if they have taken much of this mould, or have been long covered, ſo that it has entered the bark, that they are ever recoverable again; whereas it often happens, that the froſt only deſtroys the tender ſhoots; but the body and larger branches, remaining unhurt, put out again the ſucceeding ſpring.

Theſe trees are generally brought over from Italy every ſpring, by the perſons who bring over the oranges, jaſmines, &c. from whom they may be procured pretty reaſonably; which is a better method than to raiſe them from layers in this country, that being too tedious; and thoſe which are thus brought over, have many times very large ſtems, to which ſize young plants in this country would not arrive in ten or twelve years growth. When you firſt procure theſe ſtems, you ſhould, after having ſoaked their roots twenty-four hours in water, and cleaned them from the filth they have contracted in their paſſage, plant them in pots filled with freſh light ſandy earth, and plunge them into a moderate hot-bed; obſerving to ſkreen them from the violence of the ſun in the heat of the day, and alſo to refreſh them with water, as you ſhall find the earth in the pots dry. In this ſituation they will begin to ſhoot in a month or ſix weeks after, when you ſhould let them have air in proportion to the warmth of the ſeaſon; and, after they have made pretty good ſhoots, you ſhould inure them to the open air by degrees; into which they ſhould be removed, placing them in a ſituation where they may be defended from ſtrong winds: in this place they ſhould remain till October following, when they muſt be removed into the green-houſe, as was before directed. Having thus managed theſe plants until they have acquired ſtrong roots, and made tolerable good heads, you may draw them out of the pots, preſerving the earth to their roots, and plant them in the open air in a warm ſituation, where you muſt manage them as was before directed for the young ones, and theſe will in two or three years produce fruit, provided they do well. The Lucca and box-leaved olives are the hardieſt, for which reaſon they ſhould be preferred to plant in the open air; but the firſt ſort will grow to be the largeſt trees.

Olives are very oily and ſmooth, and therefore not good for the ſtomach, being apt to pall and relax it too much. The oil of olives is judiciouſly mixed with cataplaſms of a maturating nature: it is accounted heating, emollient, and vulnerary; and good againſt coſtiveneſs and gripes.

OLIVE-COLOUR, a yellow mingled with black.

OLYMPIAD, in chronology, the ſpace of four years; ſo called from the Olympic games, inſtituted by Hercules, anno mundi 2836, which were celebrated every four years, about the time of the ſummer ſolſtice, upon the banks of the river Alphæus, near the city Piſa, and the temple of Jupiter Olympius, in Elis, a province in Peloponneſus.

Theſe games were reſtored by Iphitus, four hundred and forty-two years after the firſt inſtitution by Hercules, and twenty-two or twenty-three years before the foundation of Rome.

The Greek hiſtorians began a new epocha, the firſt year of the firſt Olympiad. We are to obſerve that, to ſpeak exactly, every Olympiad year belongs to two Julian years; that is to ſay, the firſt ſix months from July to January, to the foregoing; and the ſix laſt months from January to July, to the following year; though moſt authors ſpeak of the Olympiads, as if they had begun the firſt of January, as for example, it is the ſame thing to ſay, ſuch a thing was done in the firſt year of the ſixth Olympiad, as to ſay, it was done in that Julian year in which the ſixth Olympiad began; theſe were every fifth year, or, as the interpreter of Lycophron ſays, every fiftieth month.

The deſign of the inſtitution was to accuſtom young men to running, leaping, and other exerciſes. They held but five days. The conqueror was called Olympionices, and to be crowned there, was as glorious as to triumph at Rome; for the Olympionices was attended home in his coach, the wall of the city broken down, and he drove in at the breach. Theſe were called Olympia magna, to diſtinguiſh them from other plays of this nature that were inſtituted at Macedonia, at Athens, &c. Chorœbus was the firſt who was crowned at theſe games for having obtained the victory by running. The number of Olympic years to the birth of Chriſt is 776, and the years of Rome before that time but 753, becauſe the firſt Olympiad of the chronologers began 23 years before the foundation of Rome.

OLYMPIC GAMES. See the foregoing article.

OMBRE DE SOLEIL, ſhadow of the ſun, in heraldry, is when the ſun is borne in armory, ſo as that the eyes, noſe, and mouth, which at other times are repreſented, do not appear; and the colouring is thin, ſo that the field can appear through it.

OMELET, or AMLET, a kind of pancake or fricaſee of eggs, with other ingredients, very uſual in Spain and France.

OMEN, a ſign, or indication of ſome future event, taken from the mouth of the perſon ſpeaking.

Teſtus derives the word from *oramen, quod fit ore*, as being a preſage by the mouth.

OMENTUM, in anatomy, the cawl, alſo called reticulum, from its ſtructure reſembling that of a net.

When the peritonæum is cut, as is uſual, and the cavity of the abdomen laid open, the omentum or cawl preſents itſelf firſt to view. This membrane, which is like a wide and empty bag, covers the greateſt part of the guts. Its mouth is tied on the right ſide to the hollow of the liver, on the left to the ſpleen, backwards to the back-part of the duodenum, and that part of the colon which lies under the ſtomach, and forwards to the bottom of the ſtomach and pylorus. Its bottom is looſe, and being tied to no part, but floating upon the ſurface of the guts below the navel, was the reaſon why the cawl was by the Greeks called ἐπίπλοον. Sometimes it deſcends as low as the os pubis, within the productions of the peritonæum, cauſing an epiplocele.

The cawl is a moſt delicate and fine double membrane, interlarded for the moſt part with much fat, which lines each ſide of its blood-veſſels. Theſe are veins from the portæ, called gaſtroepiplois dextra and ſiniſtra; arteries from the cæliaca. The intercoſtal nerves and the par vagum ſend it ſeveral twigs of nerves; all theſe veſſels, with ſome ſmall glands, accompanying one another, ſpread their branches very curiouſly upon the cawl, and even to the minuteſt twig; they run between two lines of fat, which are bigger or ſmaller, according to the weight of the cawl. It has been ſometimes found to weigh five pounds, but ordinarily it does not exceeed one half pound. Where there are no veſſels, the membranes of the cawl are very fine and tranſparent; they give ſeveral uſes to the cawl, as to cover the bottom of the ſtomach and the inteſtines, that by cheriſhing their heat, it may promote digeſtion, and help the concoction of the chyle; to ſtrengthen and ſuſtain the veſſels which go from the ſpleen to the ſtomach, inteſtines, pancreas, and liver; to keep a ſtore of the fat, that it may be received by the veins and lymphatics for the uſe we have already ſpoken of; to lubricate the ſuperficies of the inteſtines, and for facilitating their periſtaltic motion.

OMOPHAGIA, an ancient Greek feſtival, in honour of Bacchus, ſurnamed Omophagos, that is, eater of raw fleſh.

OMOPHORIUM, in church hiſtory, a little cloak anciently wore by the biſhops over their ſhoulders.

OMOPLATE, in anatomy, is uſed in general for the ſhoulder, but more particularly for the two bones ſituate on the hinder part of the upper ribs, one on each ſide, called alſo ſcapulæ and ſhoulder blades. See SCAPULÆ and SHOULDER.

Theſe bones are broad, and eſpecially in the middle; thick in their apophyſes, of a triangular form, concave within,

PLATE XCIII.

Facing Oil Mill.

Fig. 1.

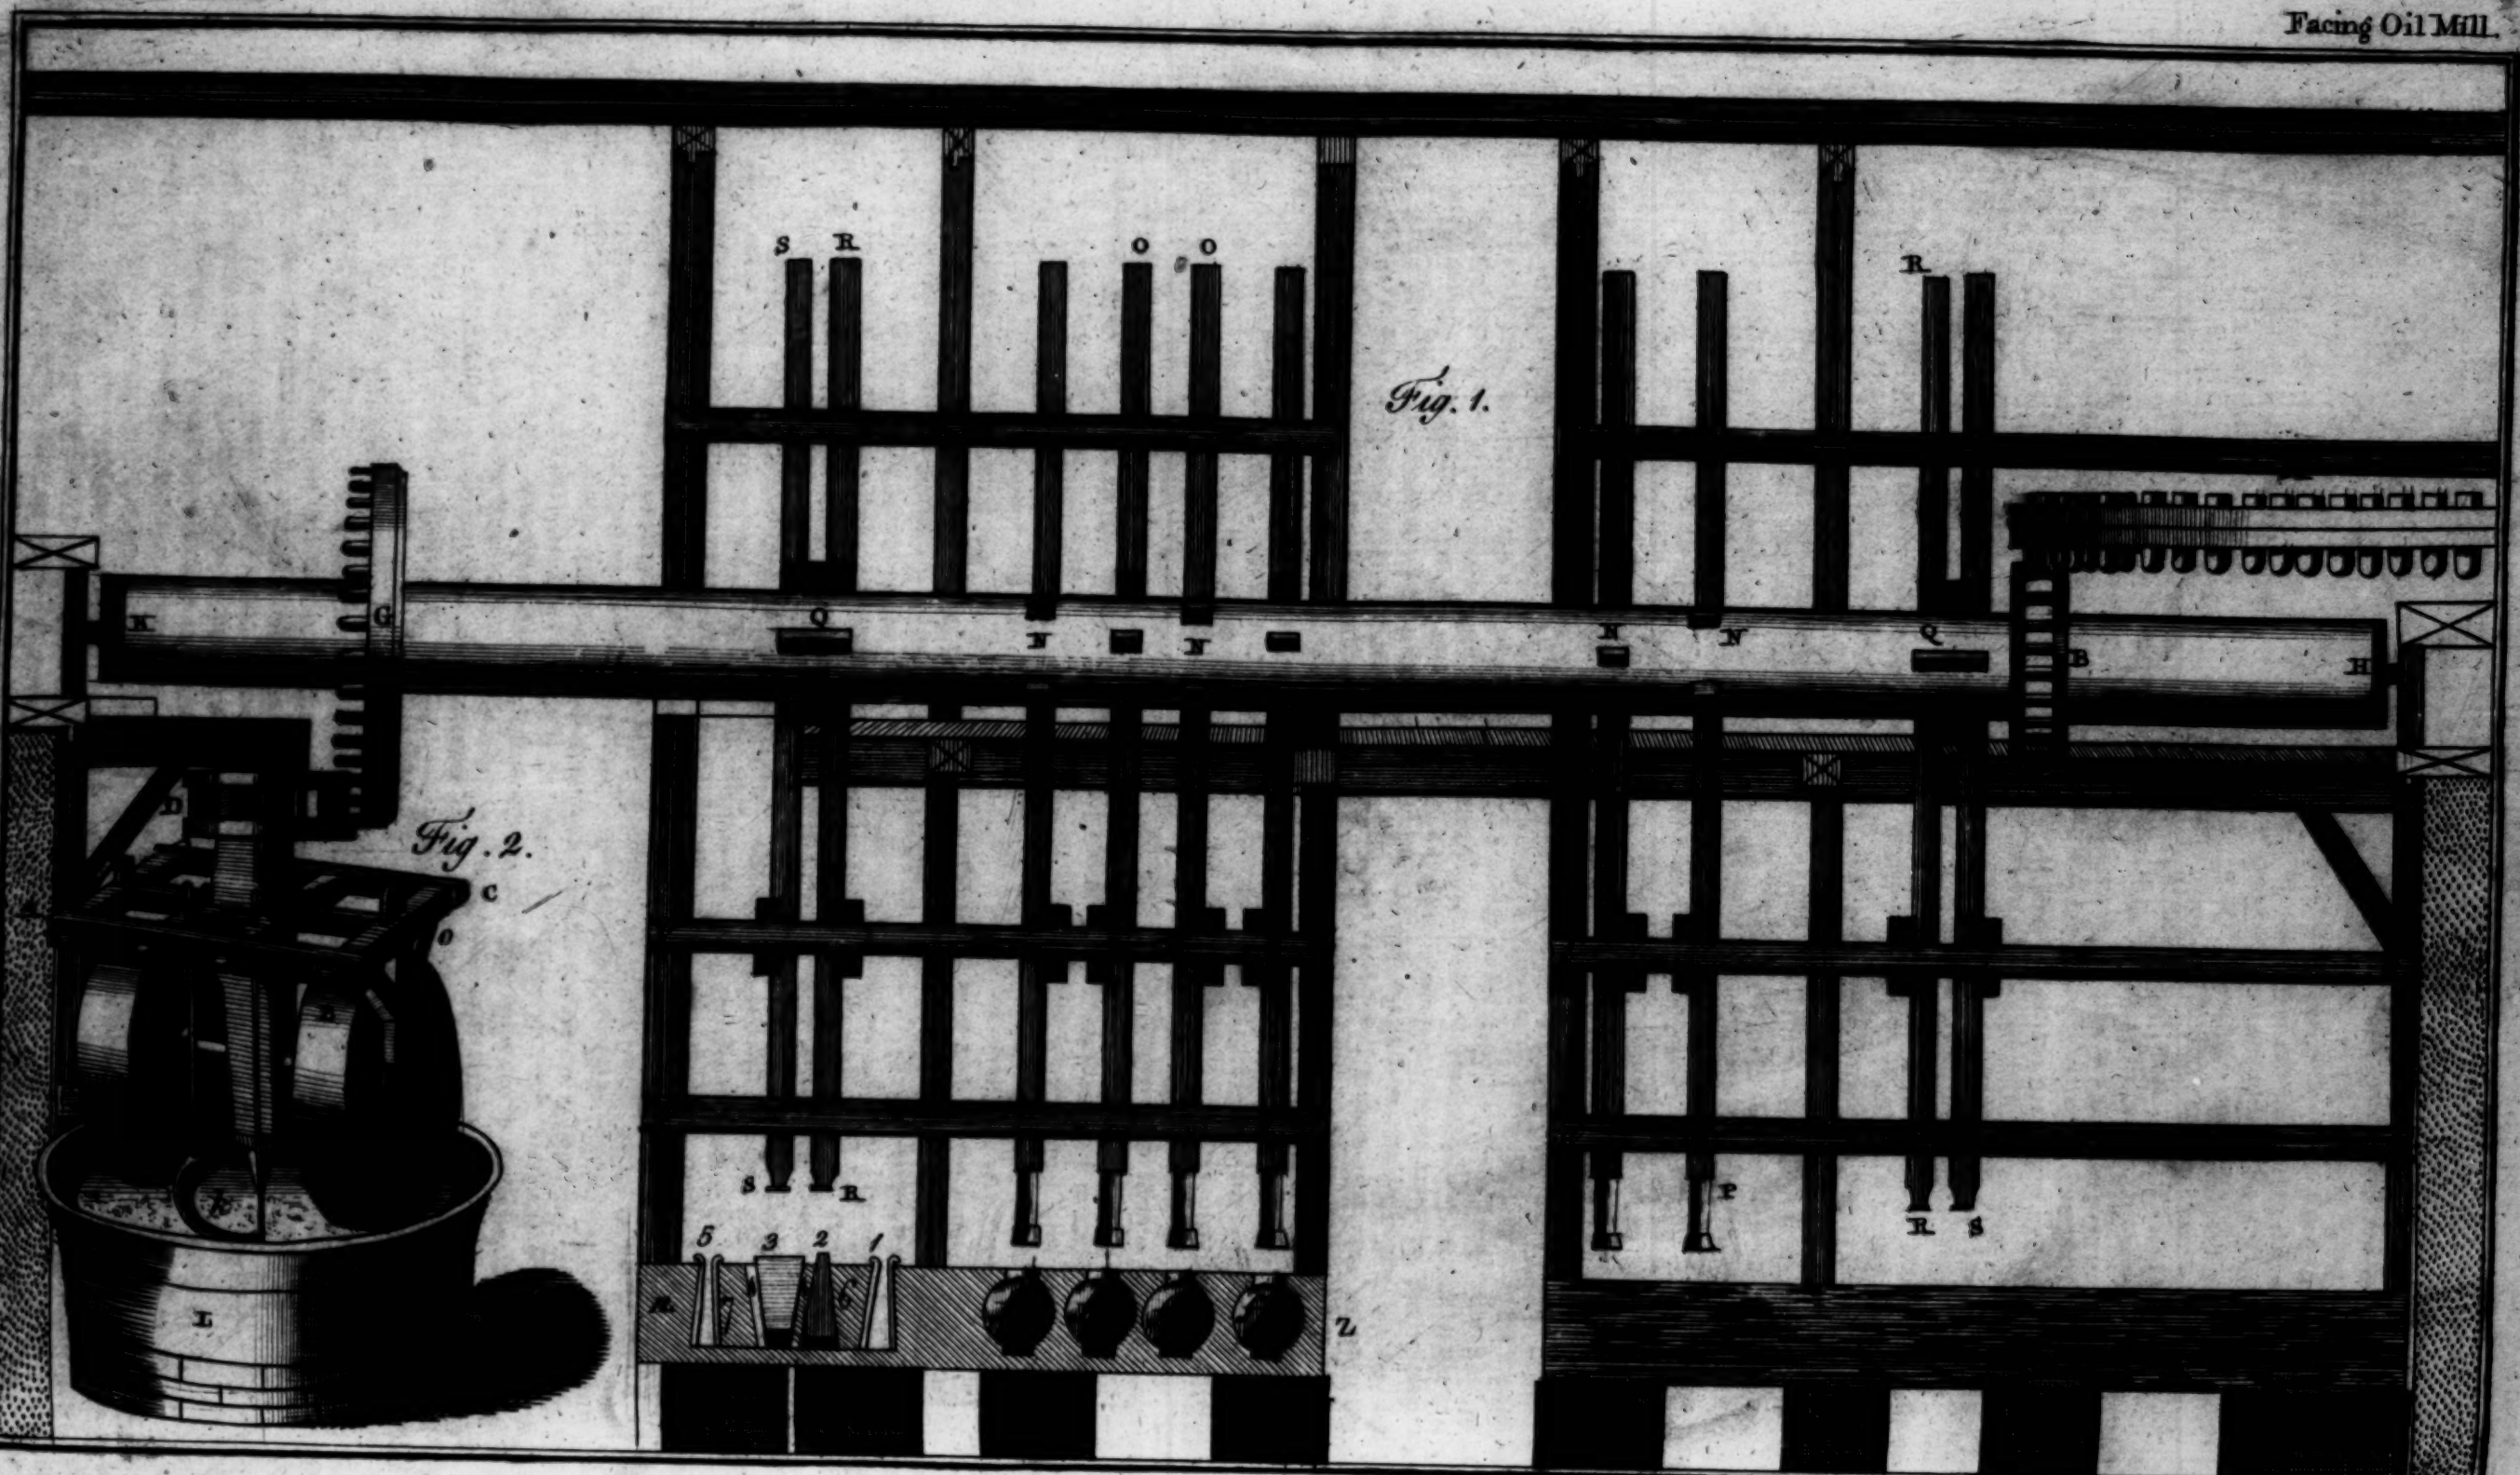

Fig. 2.

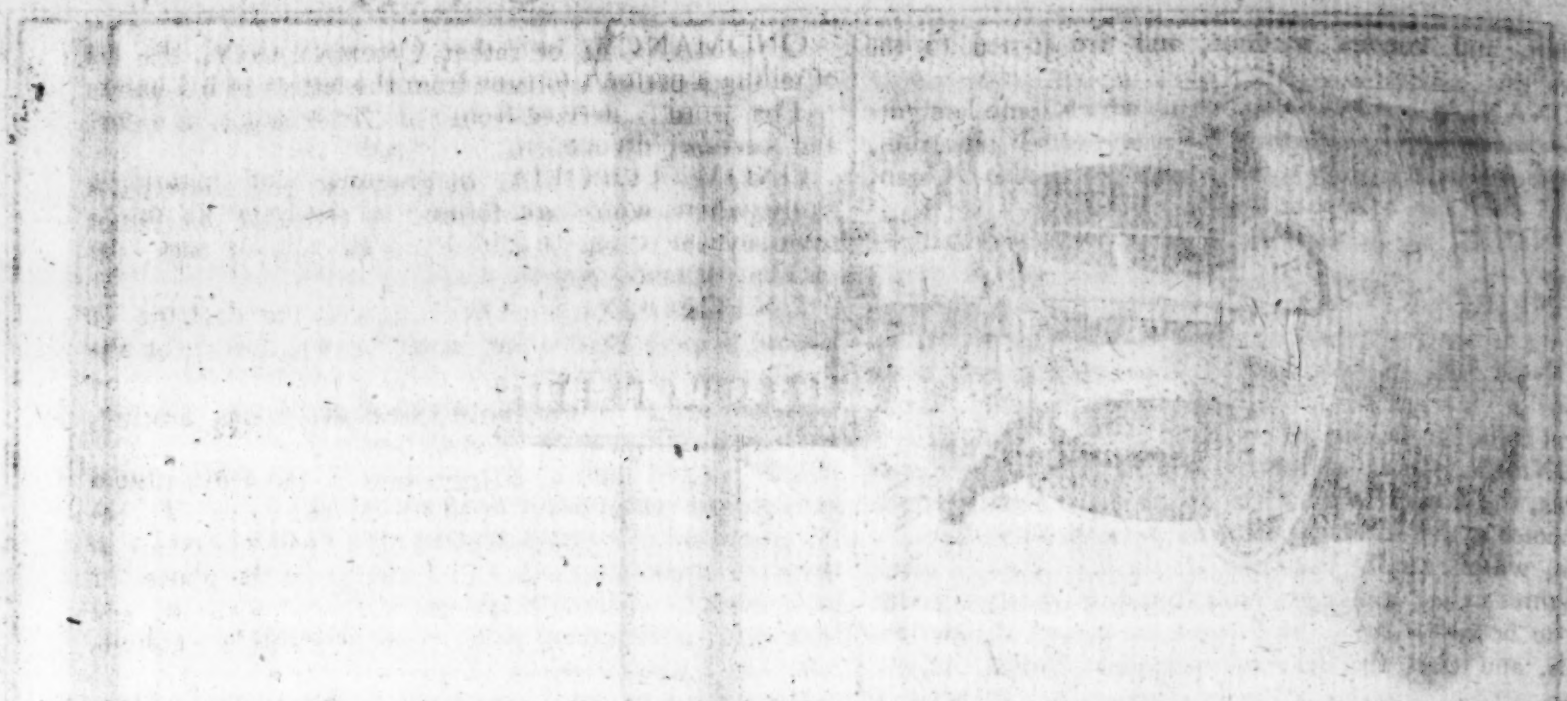


5 JA 59

within, and convex without, and are joined to the clavicles.

ONANIA, or ONANISM, terms which ſome late empirics have framed, to denote the crime of ſelf-pollution, mentioned in Scripture to have been practiſed by Onan, and puniſhed in him with death.

ONDEE, in heraldry, the ſame with wavy. See WAVY.

ONEIROCRITICA, ονειροκριτικη, the art of interpreting dreams, or predicting future events from dreams.

ONGLEE, in heraldry, an appellation given to the talons or claws of beaſts or birds, when borne of a different colour from that of the body of the animal.

ONION, *Cepa*, in botany, the name of a genus of plants, the flower of which is of the liliaceous kind, and compoſed of ſix leaves; in the center of it there ſtands a piſtil, which finally becomes a roundiſh fruit, divided into three cells, and containing roundiſh ſeeds. To this it is to be added, that the flowers are placed in ſpherical heads, and that the leaves, as well as ſtalks, are tubular.

Onions are much eaten, and it would be well if they were yet more ſo; they attenuate tough humours, cleanſe the ſtomach, and excite appetite, and in ſome degree promote the menſes; but they are apt to breed flatulencies, and, if eaten too largely, to affect the head and diſturb the ſleep afterwards. An onion, boiled to perfect ſoftneſs, is recommended by many as a cataplaſm for ripening peſtilential buboes. A freſh cut onion, rubbed on the part till it becomes red and itch, is ſaid to be a cure for baldneſs. A mixture of equal parts of juice of onions and ſpirit of wine is eſteemed a cure for deafneſs, a few drops being put at times into the ears: an onion cut in two, and macerated an hour in the ſame ſpirit, is a good application for the head-ach. A cataplaſm of roaſted onions and butter is an excellent application for the piles.

The three ſorts of onions propagated for the ſake of their roots for winter uſe, are the Straſburgh onion, the red Spaniſh onion, and the white. Theſe are to be propagated by ſowing their ſeeds in the latter end of February, in a dry and ſomewhat ſandy ſoil, yet rich; in about a month's time the plants will appear, and, in a fortnight after that, they will be forward enough for hoeing, which muſt be done with a very ſmall hoe, cutting up all the weeds, and leaving the onions two inches aſunder; this ſhould be done in a dry ſeaſon, and the ground will then be clear from weeds for a month: at the end of this time, they muſt be hoed again, and cut to three inches a-part; and a month after this, to four inches; at which diſtance they will thrive well, and grow very large. Toward the latter end of July, the onions will have arrived at their full growth, which is known by their leaves hanging down and ſhrivelling; and they muſt at this time be pulled up, and ſpread on a dry place, and turned every day, to prevent their ſtriking freſh roots; in a fortnight's time they will be dry enough to houſe, and ſhould be wiped clean, and ſpread thin in an upper loft, or garret.

The differences between theſe ſpecies are not eſſential, they often degenerating into one another; and even the large Portugal onion, after a few years, with us, will loſe itſelf ſo far, that no one would imagine it came of that race. *Miller's Gard. Dict.*

Welſh ONIONS, a ſort of onions propagated by gardeners, for the uſe of the table in ſpring; they never make any bulb, and are therefore only to be eaten green with ſallads. They are propagated by ſowing their ſeeds towards the end of July in beds of a dry but rich ſoil; and, in three weeks after ſowing, they will appear above ground: they muſt be kept carefully cleared from weeds. About October all their leaves die away, which has occaſioned ſome to think all the plantation loſt, and to dig up the ground for ſome other uſe; but, if they are ſuffered to ſtand, they will ſhoot up again very ſtrong in January, and from that time will grow very vigorouſly, and reſiſt all weathers, and will be fit to draw for young onions in March, and are extremely green and fine, and more valued at market at that ſeaſon than any other kind; but they are much ſtronger than any other onions, and have very much of the taſte of garlic.

ONOMANCY, or rather ONOMAMANCY, the art of telling a perſon's fortune from the letters of his name. The word is derived from the Greek ονομα, a name, and μαντεια, divination.

ONOMATOPOEIA, in grammar and rhetoric, a figure where words are formed to reſemble the ſound made by the things ſignified; as the buz of bees, the cackling of hens, &c.

ONTOLOGY, or ONTOSOPHY, the doctrine or ſcience *de ente*; that is, of being, in the general, or abſtract.

The word is formed of the Greek ων, οντος, a being, and λογος, a diſcourſe.

ONYX, in natural hiſtory, one of the ſemipellucid gems, with variouſly coloured zones, but none red; being compoſed of cryſtal, debaſed by a ſmall admixture of earth; and made up either of a number of flat plates, or of a ſeries of coats ſurrounding a central nucleus, and ſeparated from each other by veins of a different colour, reſembling zones or belts.

OOST, in huſbandry, a name given by the people who manure hops, for the kiln in which they dry them after they are picked from the ſtalks. This is a ſquare room, built up of brick, or ſtone, ten feet wide, more or leſs, and having a door on one ſide. In the midſt of this room is a fire-place, about thirteen inches wide, and as much high; and in length, reaching from the mouth ſo nearly to the back part of the kiln, that a man has juſt room to go round it. This fire-place is called a herſe, and the fire is let out into the room by ſeveral holes in the ſides, in the ſame manner as in malt kilns. Five feet above this, is laid the floor on which the hops are to be laid to dry, and this muſt have a wall round it, at four feet high, to keep the hops from falling out. At one ſide of the upper bed muſt be made a window by which to puſh out the hops, as they are dried, into a room prepared for them. The beds muſt be made of laths an inch ſquare, placed at a quarter of an inch diſtance from one another, and ſupported by beams underneath. The hops are to be poured on this bed with a baſket, till the whole is covered half a yard thick with them; when this is done, lay them even with a rake, and let a fire be made in the fire-place below. Some recommend a wood fire, but experience ſhews nothing does ſo well as charcoal; let the fire be kept at the mouth of the furnace, for the air will be carried all the way through; and thus let the hops lie, never ſtirring them till they are thoroughly dry; when they rattle under the rake, and the inner ſtalks are brittle, they are ſufficiently dried, and are to be puſhed out, and a freſh parcel laid in the ooſt in their place. Some people dry their hops in a common malt kiln, ſpreading them on a hair cloth about ſix inches thick, and now and then turning them till they are all thoroughly dried, then laying them in a heap, till they are to be put in the bags. But both theſe ways are liable to ſome inconveniences; the ooſt generally over-dries the under ones, by the time the upper ones are dry enough; and the hair cloth, and the turning in the other way, breaks and ſhatters them, and ſpills many of the ſeeds.

OPACITY, in philoſophy, a quality of bodies which renders them impervious tothe rays of light. See LIGHT.

The opacity and tranſparency of bodies in general are occaſioned thus: let A B (plate XCIV. *fig.* 3.) be the ſurface of an opake body A B C D; a ray of light G H falling thereon in the point H, will in part be reflected into the ray H I, and by this reflected ray, the point H becomes viſible to the eye at I; and thus all the points, and conſequently the whole ſurface, is made viſible by that part of the light which it reflects. But the other part of the ray entering into the body, being irregularly refracted and reflected through its internal ſubſtance of particles and pores, becomes divided, diſſipated, abſorbed, and loſt therein; and therefore, as none of the rays can come from the internal parts to the eye, ſo none of thoſe parts can be viſible; and the body in that caſe is ſaid to be opake. In order to this we muſt conſider, that though the whole body be opake, yet the particles of ſuch a body are not ſingly opake, but freely tranſmit the light without reflecting any part between the ſurfaces, and are therefore in themſelves tranſparent; and were theſe particles contiguous to each other, the light would

paſs from one to another, and ſo thro' the whole, without reflection; as we find by experiment it will paſs through ſeveral contiguous pieces of poliſhed glaſs, and thus produce tranſparency. But if the particles do not touch in ſuch a manner as to leave the interſtices or pores exceeding ſmall, there will be a reflection of light at every pore from the air which it there meets with, as being a medium of different denſity. For it is known by experiment, that though a ray of light will paſs from one piece of glaſs to another that is contiguous without reflection, yet will it not paſs from the glaſs thro' the contiguous air without being in part reflected; conſequently, where the pores are large and very numerous, there the reflection of light will be ſo great upon the whole as to cauſe a total diſſipation and loſs of the light that entered the body, and ſo render it opake. This is confirmed by taking ten pieces of clear glaſs, and laying them one upon another over a leaf of print quite dry, and having only air between them; then taking ten other pieces of the ſame glaſs, and putting them into water, ſo that it may fill all their interſtices; and then laying them on the ſame printed paper by the other, a perſon looking through each, will ſee the print, or reading, much more diſtinct, clear and bright, through the latter pieces than through the former, the rays being more regularly tranſmitted through them where the denſity of the parts is not ſo unequal, and alſo with much leſs reflection than through the other, where the light undergoes a conſiderable reflection at every interſtice or place of air between the glaſſes.

It is hence alſo that tranſparent bodies are rendered opake by ſeparating their parts, and rendering them more porous: thus beer, before it is raiſed into froth, is tranſparent; but the froth, by reaſon of its pores, becomes opake: thus dry paper is more opake than that which is wetted with water or oil, becauſe more porous: thus the oculus mundi ſtone is more opake when dry than when ſteeped in water; and glaſs, reduced to powder, is no longer tranſparent. Hence it follows, that the parts of bodies, and their pores, muſt not be leſs than a certain definite bigneſs to render them opake; for the opakeſt bodies, if their parts be ſubtilely divided, become perfectly tranſparent: thus copper, diſſolved in aqua-fortis, has all its particles pellucid; and the whole ſolution is tranſparent: thus a bubble blown off ſoap water, may become ſo thin on the top as to reflect no light, but will tranſmit the whole: thus water, ſalts, glaſs, ſtones, &c though they are as porous as other bodies, yet their parts and interſtices are too ſmall to cauſe reflections in their common ſurfaces.

Therefore, in all tranſparent bodies, as B E F C, (*fig.* 4.) a ray of light, K L, falling on its ſurface, in the point L, will there be in that part reflected, as before, into the ray L M; the other part will go regularly, or in a rectilineal direction from the upper to the lower ſurface at N, where meeting with the air, (a medium of a different denſity) it will be in part reflected again into the ray N O; the other part goes out to the eye at P; by which means all the internal parts from whence that ray comes, will be rendered viſible to the eye: and ſince this may be conceived of every point in the body, it is eaſy to underſtand how the whole becomes tranſparent. See REFLECTION and REFRACTION.

OPAL, in natural hiſtory, a gem of a very peculiar kind, and has been eſteemed by many in all ages of very great value, though at preſent it is of leſs value, in proportion to its ſize, than any of the finer gems. It is ſofter than any other of the fine gems, and is difficult to poliſh to any degree of nicety. It is found of various ſhapes and ſizes; its moſt frequent bigneſs is between that of a pea and a horſe-bean, but it is found as ſmall as the head of a large pin, and has been ſeen of the ſize of a large walnut. Its figure is very various and uncertain, but it is never found in a cryſtalliform or columnar ſtate; its moſt uſual ſhape is an irregularly oblong one, convex above, flatted at bottom, and dented with various ſinuoſities at its ſides. It is often found among the looſe earth of mountains, ſometimes on the ſhores of rivers, and not unfrequently bedded in the coarſer kinds of jaſper. It is found in Egypt, Arabia, ſome parts of the Eaſt-Indies, and in many parts of Europe: thoſe of Europe are principally from Bohemia, and are of a greeniſh or greyiſh colour; the colour of other opals much reſembles the fineſt mother of pearl, its baſis ſeeming a bluiſh or greyiſh white, but with a property of reflecting all the colours of the rainbow, as turned differently to the light.

OPALIA, in antiquity, feaſts celebrated at Rome in honour of the goddeſs Ops.

OPEN *Flank*, in fortification, that part of the flank which is covered by the orillon. See the article FLANK.

OPENING *of Trenches* is the firſt breaking of ground by the beſiegers, in order to carry on their approaches towards a place. See TRENCH.

OPERA, a dramatic compoſition ſet to muſic, and ſung on the ſtage, accompanied with muſical inſtruments, and enriched with magnificent dreſſes, machines, and other decorations.

OPERATION, in general, the act of exerting or exerciſing ſome power or faculty, upon which an effect follows.

OPERATION, in chirurgery and medicine, denotes a methodical action of the hand on the human body, in order to re-eſtabliſh health.

OPERATION, in chemiſtry, implies the proceſſes, or experiments, by means of which the proper changes are produced in bodies.

OPERATOR, a perſon who performs an operation.

OPHIOGLOSSUM, in botany, the plant adder's tongue. See ADDER'S TONGUE.

OPHITES, in natural hiſtory, a ſort of variegated marble, of a duſky-green ground, ſprinkled with ſpots of a lighter green, otherwiſe called ſerpentine.

OPHITES, in church hiſtory, Chriſtian heretics, ſo called both from the veneration they had for the ſerpent that tempted Eve, and the worſhip they paid to a real ſerpent: they pretended that the ſerpent was Jeſus Chriſt, and that he taught men the knowledge of good and evil: they diſtinguiſhed between Jeſus and Chriſt; Jeſus, they ſaid, was born of the virgin, but Chriſt came down from heaven to be united with him: Jeſus was crucified, but Chriſt had left him, to return to heaven. They diſtinguiſhed the God of the Jews, whom they termed Jaldabaoth, from the ſupreme God: to the former they aſcribed the body, to the latter the ſoul of men. They had a live ſerpent which they kept in a kind of cage; at certain times they opened the cage door and called the ſerpent: the animal came out, and mounting upon the table, twined itſelf about ſome loaves of bread; this bread they broke and diſtributed it to the company, who all kiſſed the ſerpent: this they called their Euchariſt.

OPHTHALMIA, in medicine, ſignifies any diſorder or pain in the eye; but it is uſed ſtrictly to expreſs an inflammation of that organ.

The word is Greek, ὀφθαλμια, and derived from ὀφθαλμὸς, an eye.

An ophthalmia, ſays M. de St. Yves, is an inflammation of the conjunctiva, ſometimes attended with violent heat and a flux of tears; ſometimes without either heat or tears. This inflammation ſometimes extends all over the globe of the eye, and even to the adjacent parts. Of all diſorders of the eye, this is the moſt frequent, as it accompanies almoſt every diſeaſe to which the eye is ſubject.

Some of theſe inflammations are without danger, and eaſily cured; others are very dangerous, and difficult to cure. Their cauſe is either external or internal: internally they proceed from the blood, whether from too great a redundancy, or ſome acquired bad quality of it; ſuch are the thickneſs, viſcoſity, acrimony, or too great rarefaction of the blood.

If the quantity of blood be exceſſive, it will be carried too copiouſly into the minute veſſels of the eye, and ſo produce an ophthalmia.

If the blood be too thick, as it is inceſſantly conveyed into the fine veſſels of the eye, its particles being too heavy and large to paſs into theſe veſſels, the circulation in theſe parts muſt be obſtructed, and an inflammation generated. When the blood is too ſharp, the ſeroſity, furniſhed by the lachrymal gland, will partake of the ſame nature; and by irritating the conjunctiva, which it conſtantly moiſtens, will produce an ophthalmia. If the blood be too much rarefied, as the rarefaction affects the

the fine delicate veſſels of the eye, it will occaſion an inflammation.

As to external cauſes, it is evident that whatever can violently irritate the conjunctiva, and the membrane which covers it, or can make a ſeparation in the veſſels of thoſe parts, will neceſſarily cauſe this diſtemper.

An ophthalmia is ſometimes attended with very dangerous accidents; it is often exaſperated by improper remedies applied by the patients when firſt attacked; it is ſometimes ſo violent, that its progreſs can hardly be ſtopped, or the ſight preſerved.

Theſe inflammations are generally divided into the dry and humid.

The dry ſpecies of ophthalmia brings a redneſs on the eye without tears, or any purulent matter. It occaſions no ſwelling of the eye-lid, nor pain in the eye, or in the head. It is cauſed by a thick blood, which ſtagnates only in ſome of the veſſels of the conjunctiva, only part of the white of the eye being red.

The humid ophthalmia is produced by a great quantity of lachrymal lymph, which, as it paſſes continually over the globe of the eye, irritates the ſame by its acrimony, inflames it and the inner part of the eye-lids, which becomes ſwelled; it likewiſe often ulcerates the tranſparent part of the cornea. This diſeaſe is attended with ſhooting pains in the eye, and the patient cannot behold the light without intenſe pain. Children and old people are both ſubject to this diſeaſe, in whom it becomes very obſtinate, by reaſon of the natural moiſture of their temperament. When it runs to a length in children, their lips and noſes ſwell, and are covered with ſcabs and puſtules, that ſometimes overſpread the face.

For cure of the dry ophthalmia waſh the inner part of the eye with collyrium, made of twelve grains of prepared tutty, diſſolved in two ounces of roſe and plantain waters, with the addition of a ſpoonful of ſpirit of wine. Take of Paul's betony, thyme, and red roſes, each a handful; two ſtalks of mullein; boil them in a gallon of wine; and at night apply to the eye a compreſs dipped in this wine.

As this ſpecies of ophthalmia is not dangerous, it requires but few medicines, and is ſometimes cured by bleeding, repeated according to the plethoric conſtitution of the patient.

The cure of the humid ophthalmia is ſometimes very difficult, and requires more medicines than the laſt, beſides ſuch repetitions of the general remedies, as the ſtate of the patient may require.

Bleeding at the neck and foot is often neceſſary. Apply a collyrium, made with the diſtilled waters of fennel, eye-bright, and plantain, of each two ounces, in which diſſolve two grains of ſalt of lead. Sometimes a ſeton, a cautery, and bliſters are obliged to be uſed. If the veſicatories incommode the kidnies or bladder, they muſt be laid aſide, and other means employed. If the firſt collyrium, which is deſigned only as a ſweetener, after ſome days, do not ſucceed, let another be ſubſtituted, which, by conſtringing the pores, will hinder the great afflux of tears to the eye; for which reaſon you may omit the ſalt of lead, and diſſolve, in the ſame waters, half a dram of the white troches of Rhaſis.

OPHTHALMICS, medicines good in diſorders of the eyes.

Ophthalmic Nerves, the fifth pair of the head.

OPHTHALMOGRAPHY, that branch of anatomy which conſiders the ſtructure and compoſition of the eye, the uſe of its ſeveral parts, and the principal effects of viſion.

The word is Greek, οφθαλμογραφια, and derived from οφθαλμος, an eye, and γραφω, to deſcribe.

OPHTHALMOSCOPIA, that branch of phyſiognomy which conſiders a perſon's eyes and looks, in order to know his temperament, humour, and manners.

The word is derived from the Greek, οφθαλμος, an eye, and σκοπεω, to view or conſider.

OPIATES, medicines prepared with opium.

OPINION, the aſſent of the mind to propoſitions not evidently true at firſt; nor deduced, by neceſſary conſequences from others that are ſo; but ſuch as carry the appearance of truth.

OPISTHOTONOS, in medicine, a ſpecies of convulſion, whereby the body is bent downward.

The word is Greek, οπισθοτονος, and derived from οπισθεν, backwards, and τονος, from τεινω, to ſtretch.

OPIUM, in pharmacy, a concrete gummy-reſinous juice; ſomewhat ſoft and tenacious, eſpecially when much handled or warmed; of a dark reddiſh brown colour in the maſs, and when reduced into powder yellow. It is brought from Egypt, Perſia, and ſome other parts of Aſia, in flat cakes or irregular maſſes, from four to about ſixteen ounces in weight, covered with leaves to prevent their ſticking together.

It is extracted from the heads of white poppies, which in thoſe countries are cultivated in fields for this uſe. Kæmpfer reports, that the heads, when almoſt ripe, are wounded with a five-edged inſtrument, by which as many parallel inciſions are made at once from top to bottom; that the juice which exudes is next day ſcraped off, and the other ſides of the heads wounded in like manner; and that the juice is afterwards worked with a little water, till it acquires the conſiſtence, tenacity, and brightneſs of the fineſt pitch. The beſt opium was formerly called Thebaic opium, from its being prepared about Thebes in Egypt: no diſtinction is now made in regard to the places of its production, though the epithet Thebaic ſerves to diſtinguiſh ſome of its officinal preparations.

Opium has a faint diſagreeable ſmell, and a bitteriſh, ſomewhat hot, biting taſte. Watery tinctures of it ſtrike a black colour with chalybeate ſolutions, and thus ſeem to diſcover ſome aſtringency. Mixed with the ſerum of blood, they thicken and render it whitiſh; and on blood itſelf, newly drawn, they have nearly a like effect. Mr. Eller obſerves, that on examining with a microſcope, blood thickened by a vinous tincture of opium, the nature of its globules ſeemed to be deſtroyed. But neither from theſe, nor any of the other known ſenſible properties of this drug, can its ſurpriſing operation in the human body be deduced.

Taken in proper doſes, it commonly procures ſleep, and a temporary reſpite from pain or the action of any ſtimulating power. The cauſe of the pain it in many caſes confirms or augments; and in not a few, it fails even of giving palliative relief. The caſes in which it is proper or improper will be beſt underſtood from a view of its general effects; which, ſo far as experience has hitherto diſcovered them, are the following.

It renders the ſolids, while the operation of the opium continues, leſs ſenſible of every kind of irritation, whether proceeding from an internal cauſe, or from acrimonious medicines, as cantharides and the more active mercurials, of which it is the beſt corrector. It relaxes the nerves; abating or removing cramps or ſpaſms, even thoſe of the more violent kind; and increaſing paralytic diſorders and all debilities of the nervous ſyſtem. It incraſſates thin ſerous humours in the fauces and adjacent parts; by which means it proves frequently a ſpeedy cure for ſimple catarrhs and tickling coughs; but in phthiſical and peripneumonic caſes, dangerouſly obſtructs expectoration, unleſs this effect be provided againſt by ſuitable additions, as ammoniacum and ſquills. It produces a fullneſs and diſtention of the whole habit, and thus exaſperates inflammations both internal and external, and all plethoric ſymptoms. It promotes perſpiration and ſweat; but reſtrains all other evacuations, unleſs when they proceed from a relaxation and inſenſibility of the parts, as the colliquative diarrhœæ in the advanced ſtage of hectic fevers. It promotes labour-pains and delivery more effectually than the medicines of the ſtimulating kind uſually recommended for that purpoſe, partly perhaps by increaſing plenitude, and partly by relaxing the ſolids or taking off ſpaſmodic ſtrictures. And indeed all the preceding effects are perhaps conſequences of one general power; being nearly allied to thoſe which natural ſleep produces.

The operation of opium is generally accompanied with a ſlow but ſtrong and full pulſe, and a ſlight redneſs, heat, and itching of the ſkin: it is followed by a weak languid pulſe, lowneſs of the ſpirits, ſome difficulty of breathing or a ſenſe of tightneſs about the breaſt, a ſlight giddineſs of the head, dryneſs of the mouth and fauces, and

and ſome degree of nauſea. Given on a full ſtomach, it commonly occaſions a nauſea from the beginning, which continues till the opium is rejected along with the contents of the ſtomach. Where the evacuation of acrid humours, accumulated in the firſt paſſages, is ſuppreſſed by it, great ſickneſs and uneaſineſs are generally complained of, till the ſalutary diſcharge either takes place again ſpontaneouſly, or is promoted by art.

An over doſe occaſions either immoderate mirth or ſtupidity, a redneſs of the face, ſwelling of the lips, relaxation of the joints, vertigo, deep ſleep with turbulent dreams and ſtartings, convulſions, and cold ſweats. Geoffroy obſerves, thoſe who recover, are generally relieved by a diarrhœa, or by a profuſe ſweat, which is accompanied with a violent itching. The proper remedies, beſides emetics, bliſters, and bleeding, are acids and neutral mixtures: Dr. Mead ſays he has given, with extraordinary ſucceſs, repeated doſes of a mixture of ſalt of wormwood with lemon juice.

A long continued uſe of opium is productive of great relaxation and debility, ſluggiſhneſs, heavineſs, loſs of appetite, dropſies, tremors, acrimony of the humours, frequent ſtimulus to urine, and propenſity to venery. On leaving it off, after habitual uſe, an extreme lowneſs of the ſpirits, languor, and anxiety, ſucceed; which are relieved by having again recourſe to opium, and in ſome meaſure by ſpirituous or vinous liquors.

With regard to the doſe, one grain is generally a ſufficient, and ſometimes too large a one: maniacal perſons, and thoſe who labour under violent ſpaſms, require oftentimes two, three, or more grains; though even in theſe caſes, it is generally more adviſable to repeat the doſe at proper intervals, than to enlarge it. By frequent uſe, much greater quantities may be borne; the Turks, who habituate themſelves to opium as a ſuccedaneum to ſpirituous liquors, are ſaid to take commonly a dram at a time, and Garcias ſays, that he knew one who every day took ten drams.

Opium appears to conſiſt of about five parts in twelve of gummy matter, four of reſinous matter, and three of earthy or other indiſſoluble impurities. From theſe laſt it is purified, in the ſhops, by ſoftening the opium with boiling water, in the proportion of a pint to a pound, into the conſiſtence of a pulp, with care to prevent its burning; and whilſt it remains quite hot, ſtrongly preſſing it from the fæces through a linen cloth: the ſtrained opium is then inſpiſſated in a water-bath or other gentle heat, to its original conſiſtence. When thus ſoftened with a ſmall quantity of water, the gummy and reſinous parts paſs the ſtrainer together; whereas, if diſſolved by a larger quantity, they would ſeparate from one another.

It has been diſputed, whether it is in the gummy or in the reſinous parts of opium, that its activity reſides. From the experiments of Hoffmann and Neumann, it ſeems to be neither in the direct gum, nor in the direct reſin, but in a certain ſubtile part of the reſinous matter, ſomewhat analogous to eſſential oils, but of a much leſs volatile kind: they report, that on boiling the opium in water there ariſes to the ſurface a frothy, viſcid, unctuous, ſtrong ſcented ſubſtance, to the quantity of two or three drams from ſixteen ounces: that this ſubſtance, in the doſe of a few grains, has killed dogs that could bear above a dram of crude opium; that in diſtillation with water, though it does not riſe itſelf, it gives over, at leaſt in part, the active principle of which it is the matrix; impregnating the diſtilled liquor with its ſcent and its ſoporific power; as eſſential oils exhale their odoriferous principle in the air, without being diſſipated themſelves. What this ſubtile and highly active principle really is, in eſſential oils, in odorous vegetables that yield no oil, and in opium, is equally unknown.

Both water and rectified ſpirit extract, difficultly, by maceration or digeſtion, the active matter of opium, and receive from it a yellow or browniſh tincture. The watery ſolution is found to contain great part of the reſin along with the gum; and the ſpirituous, a ſmaller proportion of the gum along with the reſin. Such part of the gum as is left by ſpirit, and ſuch part of the reſin as is left by water, are equally inert.

Tinctures of opium in water, wine, and proof ſpirit, have the ſame effects as the opium in ſubſtance; with this difference, that they exert themſelves ſooner in the body, and are leſs diſpoſed to leave a nauſea on the ſtomach. Tinctures made in rectified ſpirit are ſaid to act with greater power than the others: Geoffroy relates, from his own obſervation, that while the watery and vinous tinctures occaſioned quiet ſleep, the ſpirituous brought on a phrenzy for a time. It is ſaid likewiſe, that alkaline ſalts diminiſh the ſoporific virtue of the opium; that fixed alkalies render it diuretic, whilſt volatile ones determine its action to the cutaneous pores; and that acids almoſt entirely deſtroy its force.

The officinal tinctures of opium are made in wine or proof ſpirit. The college of London directs two ounces of ſtrained opium to be macerated without heat for a week in a pint of Mountain, with the addition of a dram of cinnamon, and as much cloves to alleviate the ill ſmell of the opium: the college of Edinburgh orders the ſame quantity of crude opium to be digeſted in a ſand heat, in a pint and a quarter of a compound aromatic ſpirituous diſtilled water, or ſpirituous cinnamon water, with or without the addition of an ounce of ſaffron: a mixture of wine and proof ſpirit has been ſometimes made choice of, in order to prevent, in ſome meaſure, an inconvenience which both of them ſeparately, conſidered as officinals, are liable to, being apt to throw off in long ſtanding a part of the opium, which in wine falls to the bottom, and forms a cruſt on the ſurface of ſpirit. Of the firſt of the above tinctures twenty drops, and of the latter twenty-five drops, are reckoned to contain one grain of opium; but as theſe quantities of the menſtrua do not eaſily diſſolve all the active matter of ſo large a proportion of the opium, thoſe doſes are generally obſerved to have ſomewhat leſs effect than a grain of the drug in ſubſtance. As drops alſo, according to different circumſtances, vary in quantity, though in number the ſame, it were to be wiſhed that the ſhops were furniſhed with a ſolution of this drug, made in a quantity of menſtruum large enough not only for the complete extraction of the active parts, but to admit of the doſe being exactly determined by weight or meaſure.

In a ſolid form, independently of ſuch materials as may be ſubſervient to the other indications of cure, it is ſometimes mixed with ſaponaceous or gummy ſubſtances which promote its diſſolution in the ſtomach, and ſometimes with reſinous ones which render its diſſolution and operation more gradual and ſlow: to theſe is commonly ſuperadded ſome aromatic ingredient, to prevent its occaſioning a nauſea. Thirty-two parts of almond ſope, four of ſtrained opium moiſtened with a little wine, and one of eſſence of lemons, beaten together, make an elegant pill of the firſt kind; and ſixteen parts of ſtrained ſtorax, eight of ſaffron, and five of ſtrained opium, of the latter.

Many have endeavoured to correct certain ill qualities which they ſuppoſe opium to be poſſeſſed of, by roaſting it, by fermentation, by long continued digeſtions, by repeated diſſolutions and diſtillations. Theſe kinds of proceſſes, though recommended by ſeveral late writers, do not promiſe any ſingular advantage. That they weaken the opium is indeed very probable; but this intention is anſwered as effectually, and with far greater certainty, by diminiſhing the doſe of the opium.

OPOBALSAMUM, in pharmacy, the ſame with the balſam, or balm of Gilead. See BALSAM.

OPOPANAX, in the materia medica, is a concrete gummy-reſinous juice, obtained from the roots of an umbelliferous plant, which grows ſpontaneouſly in the warmer countries, and bears the cold of our own. The juice is brought from Turkey and the Eaſt-Indies, ſometimes in little round drops or tears, more commonly in irregular lumps, of a reddiſh yellow colour on the out-ſide with ſpecks of white, internally of a paler colour, and frequently variegated with large white pieces.

This gummy-reſin has a ſtrong diſagreeable ſmell, and a bitter acrid, ſomewhat nauſeous taſte. It readily mingles with water, by tincture, into a milky liquor, which on ſtanding depoſites a portion of reſinous matter and becomes yellowiſh: to rectified ſpirit it yields a gold-coloured

loured tincture, which taſtes and ſmells ſtrongly of the opopanax.

Opopanax is an uſeful attenuant and deobſtruent, and in conſiderable doſes looſens the belly. It is given from a ſcruple to a dram, in the ſame intentions as ammoniacum or galbanum: and joined in ſmaller doſes as an auxiliary to thoſe and the other deobſtruent gums.

OPOSSUM, in zoology, a very ſingular animal, about fifteen inches long from the extremity of the noſe to the rump; and its tail is equal in length to the whole body: the legs are robuſt, and the feet armed with ſharp, long, and crooked claws. But what is moſt ſingular in this animal is, that the ſkin of the belly of the female is looſe, forming a kind of pouch or bag, with an aperture in it, at which, in time of danger, it takes in its young.

OPPONENT, a perſon who withſtands or oppoſes another.

OPPOSITES, *Oppoſita*, among logicians, ſimply taken, are ſuch things as differ among themſelves, but ſo as not to differ in like manner from ſome third.

Opposite Angles. See Angle.

Opposite Cones. See Cone.

Opposite Sections are two hyperbolas made by cutting two oppoſite cones by the ſame plane. See Hyperbola and Conic Sections.

OPPOSITION, in logic, the diſagreement between propoſitions, which have the ſame ſubject and the ſame predicate.

Opposition, in aſtronomy, is that aſpect or ſituation of two ſtars or planets, wherein they are diametrically oppoſite to each other, or 180° aſunder.

Opposition, in geometry, the relation of two things, between which a line may be drawn perpendicular to both.

Opposition, in rhetoric, a figure whereby two things are joined, which ſeem incompatible.

OPTATIVE Mood, in grammar, that which ſerves to expreſs an ardent deſire or wiſh for ſomething. See the article Mood.

In moſt languages, except the Greek, the optative is only expreſſed by prefixing to the ſubjunctive an adverb of wiſhing, as *utinam*, in Latin; *plut a Dieu*, in French, and *would to God*, in Engliſh; but in Greek, it is expreſſed by a peculiar inflection, *οιμι*, *οις*, *οι*, &c.

OPTIC, or Optical, ſomething relating to viſion, or the ſenſe of ſight. See Vision.

Optic *Angle*. See *Optic* Angle.

Optic *Axis* is a ray paſſing through the center of the eye, and the middle of the optic pyramid.

Optic *Glaſſes* are glaſſes ground either convex or concave, in order either to collect or diſperſe the rays of light; by means of which viſion is improved, and the eye ſtrengthened and preſerved.

Optic *Inequality*, in aſtronomy, is the apparent irregularity in the motions of far diſtant bodies, but ariſing from the ſituation of the ſpectator's eye: ſo that, were the eye in the center, the motions would always appear uniform.

Optic *Nerves*, the ſecond pair of nerves, ſpringing partly from the extremity of the corpora ſtriata, and partly from the thalami nervorum optici. See the article Nerve.

Optic *Pencil*, or a *Pencil of Rays*, that aſſemblage of rays by means of which any point, or part of an object, is rendered viſible.

Optic *Place*. See Place.

Optic *Pyramid*, in perſpective, is the pyramid ABCO (plate XCIV. *fig.* 5.) whoſe baſe is the viſible object ABC; and its vertex in the eye O, formed by rays drawn from the ſeveral points of the perimeter to the eye.

OPTICS, Optica, is properly the ſcience of direct viſion. See Vision.

Optics is alſo uſed, in a larger ſenſe, for the ſcience of viſion, or viſibles in general; in which ſenſe optics include catoptrics and dioptrics.

The general principle of optics, catoptrics, and dioptrics, is as follows.

In ſimple optics the direct ray comes in the ſhorteſt direct way from the radiant point C (plate XCIV. *fig.* 6.) to the point to be enlightened E; namely, the medium remaining the ſame; that is, in the right line CE.

In catoptrics, the angle of incidence CEA, and of reflexion DEB, are equal: for let C be the radiant, D the point to be enlightened, and AB a plane ſpeculum, the point E of the ſpeculum reflecting the ray to D is ſought; we ſay it is ſuch that CE+ED is the leaſt poſſible, and this will happen when the angle CEA and DEB are equal.

In dioptrics, the ſines of the complements EH and EL of the angles of incidence CEA, and of refraction GEB, have always the ſame ratio, which is reciprocal to the reſiſtance of the mediums. Let IE be air, EK water, glaſs, or any other medium denſer than air, CE the incident ray, and EG the refracted one; put m and n for the reſiſtance, with reſpect to light and air; then the path CEG of the incident and refracted ray will be as the ſum of the rectangles $CE \times m + EG \times n$, and muſt be the leaſt poſſible, or leſs than $CE \times m + FG \times n$, aſſuming any other point F beſides E. In order to find this point, we have the points C and G, as alſo the right-line AB given in poſition; therefore call the right lines perpendicular to the plane CH, c, and GL, g; and HL, which is alſo given, h; put $EH = y$, then EL will be $h - y$, and $CE = \sqrt{cc+yy}$, which put equal to p; and for EG, or $\sqrt{gg+yy-2hy+hh}$, write q; whence we have $n\sqrt{cc+yy} + m\sqrt{gg+yy-2hy+hh}$, or $mp + nq$, for the ſum of the rectangles $CE \times m + EG \times n$; which being put into fluxions, and properly reduced, gives $mqy = np \times \overline{h-y}$, or np to mq as y to $h-y$; or the rectangle $CE \times n$ to the rectangle $EG \times m$, as EH to EL: therefore, ſuppoſing CE and EG equal, n the reſiſtance of the water, in reſpect of light, will be to m the reſiſtance of air, as EH the ſine of the complement of the angle of incidence CEA in air, to EL, the ſine of the complement of the angle of refraction GEB in water; or the ſines of the complements will be in the reciprocal ratio of the reſiſtance of the mediums. If therefore EL, in one inſtance or experiment, be found to be $\frac{3}{4}$ of EH, it will be alſo in all others, wherever C and G are taken, the former in air, the latter in glaſs; if E be in air, and G under water, EL will be $\frac{3}{4}$ of EH nearly.

From this calculation we get the following conſtruction.

Deſcribe the circle CBG from the center E, with the radius EC or EG, and let CE meet its tangent at B produced in V, and EG in T; let the eye be in C, and the object which is ſeen under the water in T, and the point T will appear to be in V; becauſe we ſeem to ſee it along the right line CEV; yet, ſince we really ſee it by the broken line CET, it is plain that EV is the ſecant of the angle of incidence CEA, or its equal VEB; and that ET is the ſecant of the angle of refraction GEB; but, from a known propoſition in trigonometry, the ſecants are reciprocally as the ſines-complement; therefore, directly, EV is to ET as EL to EH; that is, as m to n. The eye at C therefore being in a different medium than the object T, the apparent ray EV in the medium of the object (water) is to the true ray ET in the ſame medium of the object (water) as m the reſiſtance of the air, the medium of the eye, to n, the reſiſtance of water, the medium of the object; which ratio, as it is always the ſame, the mediums remaining the ſame, the ratio therefore, between the true ray ET and the apparent ray EV, will be always the ſame, which agrees with a theorem given for the ſame purpoſe by Snellius.

In the ſame manner, ſeeing the ratio of EL and EH, the coſines of the angles of refraction and incidence, is reciprocal to the reſiſtance of the mediums; it will always be the ſame, which is Des Cartes theorem, deduced from principles very different to thoſe made uſe of by Snellius. This coincidence of concluſions ariſing from ſuch different principles, made Spleſſius, a man very converſant in theſe ſtudies, doubt whether Des Cartes, when in Holland, had not ſeen Snellius's theorem; for he obſerves, that it was a common thing with him to omit the names of authors; and he gives his vortices as an inſtance, at which Jordanus Brunus and Joh. Kepler had hinted in ſuch a manner, that they ſeem to have only

wanted that term: add to this, that Des Cartes ſetting about to demonſtrate this theorem by his own ſkill, fell into great difficulties: for, becauſe he ſaw that the ray C E, carried from air into water, is there refracted in E G, and that towards the perpendicular E K; and therefore rendered more ſimilar to that ray (whoſe action is ſtronger), namely, the perpendicular ray, he ſuſpected that it met with leſs reſiſtance in water, or glaſs, than in air: whereas, ſuppoſing the contrary, which is much more agreeable to reaſon, and employing that general principle, viz. that nature in all its operations takes the neareſt ways; we may arrive at the ſame concluſion. Whence Fermat rightly obſerved, that Des Cartes had not given the true reaſon of his theorem; and likewiſe the compariſon, by which he endeavours to illuſtrate his explication, is but little to the purpoſe. Let the ball A (*fig.* 7.) running on a ſmooth table B C, in the place A, meet in the middle of its courſe part of the table D E, covered with tapeſtry, when it will run ſlower in 2 A. In the ſame manner, therefore, he thinks, that glaſs, or any other ſolid body, leſs hinders the rays of light than air, which is not ſo ſmooth; but (not to mention that the parts of water are ſufficiently yielding, according to Des Cartes himſelf) it is ſufficient to conſider that the ball, when it comes from 2 A, after having paſſed over the tapeſtry D E, again comes to a ſmooth part of the table in 3 A, and cannot there recover its former celerity, which it had in 1 A, before it meets the tapeſtry; yet, ſince the ray of light does again enter from a greater reſiſting medium into a leſs reſiſting medium ſimilar to the firſt, and recovers its former ſtate; and ſuppoſing that the ſurfaces of two ſimilar mediums, to wit, the firſt and the laſt, be parallel planes, it may receive a direction by the latter refraction, parallel to that which it had before the former refraction.

The manner in which Des Cartes explains both reflexion and refraction of light, in imitation of the motion of other bodies, ſeems to be worthy of his genius, and not to be rejected but only amended: for, as to reflexion, he ſhould have in the firſt place explained, why any ball as I (*fig.* 8.) falling along the perpendicular I E on the plane A B is from thence reflected: for we obſerve that ſome bodies, namely ſuch as are ſoft, are not equally reflected, the true cauſe of which reflexion is the elaſticity either of the ball or plane, or both; for an elaſtic plane will yield a ſmall matter, as we obſerve a ſtretched membrane or inflated bladder does to a falling pebble. And indeed, it will yield ſo much the more as the ſtroke is ſtronger; and reſtoring itſelf with ſo much the greater force, it reflects the impinging body towards the ſame parts, and with the celerity it came: for although Des Cartes would not admit of this explication of reflexion, advanced by ſome of his contemporaries, as appears from his letters; yet at this time it is verified, both by reaſon and by experiment. Since therefore the ball comes from C to E in the right line C E, and conſequently with a motion compounded of two others, to wit, the horizontal, as C I or H E, by which it comes from C H to I E, and the perpendicular, as C H or I E, by which it comes from C I to H E, both beginning at C and terminating in E: and as the ſurface A B does not oppoſe, but is parallel to its horizontal conatus, coming into E from C H towards I E in the right line C I or H E; it will therefore retain unchanged both the celerity and direction of its horizontal motion; and the ſame ſpace of time it ſpent in coming from C H to I E, it will likewiſe ſpend in coming from E I to R D, ſuppoſing the intervals between C H and I E, as alſo between I E and R D, to be equal: but the perpendicular motion whereby it came from C I to H E, retaining its velocity, will be changed into the contrary direction, that it may ſpend as much time in which it may return from E R to I D. Since therefore E R is equal to E H, and R D to C H, the triangles C H E and D R E will be ſimilar and equal, and conſequently, the angle D E B will be equal to the angle C E A. All this will be more manifeſt, if we ſuppoſe the ruler C I D parallel to the ſurface A B, and retaining its parallelism through C H and D R to impinge on A B in H R, while in the mean time a ball in the ruler C I is carried from C to I; whence in reality the whole compound motion of the ball will be in the diagonal C E: but the ruler C I D reflected by the ſolid ſurface A B will return with the ſame celerity, and by the ſame way it came, and in an equal time will again come to C I D; while in the mean time the ball continuing its motion in the ruler, has advanced with the ſame celerity: and therefore in the ſame time arrives from I to D through I D = to C I; for the celerity remaining the ſame, equal ſpaces are run over in equal times: the ball, therefore, with a motion compounded of its own motion upon the ruler through I D, and that of the ruler along E I, to wit, returning from H R to C D, will be carried from E to D along the right line E D.

In order to explain refraction, we are to conſider that the greater reſiſting medium to light (yet without opacity) ſeems to be that which more obſtructs the diffuſion or diſtribution of light through more parts of the medium; and it may be called leſs illuminable; for the nature of light endeavours to diffuſe itſelf. On the contrary, by how much more the light equably affects the parts of the medium it illuminates, or communicates its force to a greater number of ſmall particles of the illuminated place, the medium will be the more illuminable, and leſs reſiſt light: whence the more ſolid and ſmall the parts of the medium affected by light are, or the leſs ſpace they leave between them for another heterogeneous matter, not affected by light, the medium will be ſaid to be the more illuminated. But it appears from mechanical principles, that the ſame ſtroke impreſſed on ſeveral bodies at the ſame time, communicates a leſs force than if the ſtroke had been given to one of them: it will, therefore, happen, that in a medium which more reſiſts the diffuſion of light, or which is affected in a leſs number of its parts, each part is ſo much the more ſtrongly affected: in a more illuminable medium more parts are affected, but weaker and with a more languid impreſſed ſtroke. Aſſuming now the motion of the ball inſtead of the ray, and ſuppoſing the ball coming from G to E, there to impinge on a medium, which ſhall retard its celerity or impetus, ſuppoſe in a ſeſquialteral ratio. If, therefore, in a minute of time it comes from G to E in the former medium K E; in the new medium E I the ſmall ball will come from E to C in a minute and a half, ſuppoſing E C and G E to be equal in whatever point C is. But ſince the ſurface A B that ſeparates the mediums ſhall not oppoſe the horizontal celerity in G K, L E, and the parallels thereof upon the ball's firſt entering into the new medium E I, or in the very point E (for the horizontal motion L E H only grazes along the ſeparating ſurface A B) but in the firſt moment of its entering, or in the point E (conſidering the ball as indefinitely ſmall like a point, as rays themſelves are uſually conſidered without breadth) the inclination of the line C E is to be preſently determined. It is, therefore, to be taken at the very firſt; ſo that, in reſpect of the horizontal motion, the velocity may remain the ſame; and ſuch as it was aſſumed at the beginning of its ingreſs into the new medium, ſuch it remains therein: the ball, therefore, while it went in the former medium from G to E, had paſſed over in a minute of time with the horizontal direction the interval G K or L E (between G L and K E); it now in a minute and half of time, in which it ſhould move from E to C, will accompliſh in the ſame horizontal direction the interval E H or I C (comprehended between E I and H C), which ought to be ſeſquialteral of the former L E, becauſe the horizontal velocity remaining the ſame, which is not changed by refraction, the ſpaces are as the times: E H, therefore, is to E L in the direct ratio of the times, or the reciprocal ratio of the celerities or reſiſtances; for we have ſhewn in the caſe of the light, whoſe diffuſion is impeded by the reſiſtance of the medium, that the velocity or impetus increaſes according to the reſiſtance, and languiſhes according to the greater facility of diffuſing itſelf in each part. On the contrary, that the ray recovers its force, and conſequently its direction, when again it comes into a medium where there is a leſs diffuſion, and more rays are employed in impelling a fewer number of parts; and this recovery Des Cartes, as we have mentioned before, could not explain by his compariſon of the tapeſtry, or any rough body.

Euclid has written on the ancient optics and catoptrics: dioptrics were unknown to them. F. Honorat. Fabri

Fabri has an abridgement of optics, catoptrics, and dioptrics. Father Eſchinard has given a century of problems in optics. Vitellio and Alhazen have performed well on the Elements of Optics. Father Kircher has a large volume on the Secrets of Optics, of Light, and Shadow, and their ſurpriſing effects, which paſs on the people for magic. We have alſo *L'Optique & Catoptrique* of father Merſenne, Paris 1641. *Dioptrique Oculaire* of father Cherubin, Paris 1651, fol. Chriſt. Sheineri *Optica*, London 1652. Jacobi Gregorii *Optices*. Barrovii *Lectiones Opticæ*, Lond. 1665. Joh. Bapt. Porta *de Refractione Optices*. Lond. 1669. *Principe generale de l Optique*, by M. Leibnitz, in the Leipſic Acts, 1682. *L'Occhiale all'Occhio*, or *Dioptrica Practica*, Carol. Ant. Mancini, Bologna, 1660, 4°. *Phyſico-matheſis de Lumine Coloribus, & Iride*, per F. Mar. Grimaldi, Bononiæ, 1665, 4°. *Cogitationes Phyſico-mechanicæ de Natura Viſionis*, per Joh. Ott. Scaphuſam, Heidel. 1670, 4°. and, which ought to be named firſt, the great Sir Iſaac Newton's Optics, Latin and Engliſh, 4°. and 8°.

OPULUS, the water-elder, in botany, a genus of plants, with a monopetalous, campanulated flower, quinquifid at the limb: the fruit is a roundiſh unilocular berry, containing a ſingle, oſſeous, and compreſſed cordated ſeed.

OPUNTIA, Indian fig, in botany, a ſpecies of cactus, diſtinguiſhed by being ramoſe and dichotomous.

It is on this plant that the cochineal animal feeds.

OR, in heraldry, denotes yellow, or gold colour. See COLOUR and METAL.

It is repreſented in engraving by ſmall points or dots, ſcattered all over the field or bearing.

ORACLE, among the heathens, was the anſwer which the gods were ſuppoſed to give to thoſe who conſulted them upon any affair of importance; it is alſo uſed for the god who it was thought gave the anſwer, and the place where it was given.

The credit of oracles was ſo great, that in all doubts and diſputes their determinations were held ſacred and inviolable; whence vaſt numbers flocked to them for advice about the management of their affairs; and no buſineſs of any conſequence was undertaken, ſcarce any peace concluded, any war waged, or any new form of government inſtituted, without the advice and approbation of ſome oracle. The anſwers were uſually given by the intervention of the prieſt or prieſteſs of the god who was conſulted, and generally expreſſed in ſuch dark and indeterminate phraſes, as might eaſily be wreſted to prove the truth of the oracle, whatever was the event. It is not, therefore, to be wondered at, that the prieſts who delivered them were in the higheſt credit and eſteem; and that they improved this reputation greatly to their advantage. They accordingly allowed no man to conſult the gods, before he had offered coſtly ſacrifices, and made rich preſents to them. And to keep up the veneration for their oracles, and to prevent their being taken unprepared, they admitted perſons to conſult the gods only at certain ſtated times; and ſometimes they were ſo cautious, that the greateſt perſons could obtain no anſwer at all. Thus Alexander himſelf was peremptorily denied by the pythia, or prieſteſs of Apollo, till ſhe was, by downright force, obliged to aſcend the tripos; when, being unable to reſiſt any longer, ſhe cried out, "Thou art Invincible;" and theſe words were accepted inſtead of a farther oracle. The principal oracles of antiquity were, 1. The oracle of Dodona, where there was a temple conſecrated to Jupiter: the prieſts who delivered theſe oracles were called ſelli; but in latter ages they were pronounced by three old women. Near the temple of Dodona was a ſacred grove of oaks, which were ſaid to be endued with a human voice, and a prophetical ſpirit; the reaſon of which fiction ſeems to have been, that the prieſts often concealed themſelves within the hollow of theſe trees, and from thence delivered oracles. 2. The oracle of Olympian Jupiter at Elis. 3. The oracle of Apollo at Delphi, where it was pretended that an inſpiring vapour aroſe from the mouth of a deep cavern, on which the pythia being placed on a three-legged ſtool, received the divine afflatus, and became inſpired: this oracle was the moſt famous of all others. 4. The oracle of Trophonius, at Lebadea, a city in Bœotia, at which, after a number of ceremonies were performed, the votary deſcended into Trophonius's cave, where future events were revealed to him in a very extraordinary manner. It is remarkable, that all who conſulted this oracle ſeemed to be frighted out of their ſenſes; for ſome time after, they became penſive and melancholy, their tempers were ſowered, and their countenances, however gay and pleaſant before, were rendered dull and heavy. 5. The oracle of Amphiaraus, the anſwers of which were delivered in dreams, while the perſon ſlept on the ſkin of the victim he had ſacrificed. 6. That of Mercury, at Pharæ, a city of Achaia, where thoſe who wanted information, after offering frankincenſe upon the altar, and preſenting a piece of money, placed their ear to the ſtatue, and then ſtopping both ears till they were at ſome diſtance, took away their hands, and received the firſt voice they heard as a divine oracle. 7. The oracle of Hercules at Bura, where was a cave, in which was placed the ſtatue of Hercules: here they who conſulted the god firſt addreſſed themſelves to him by prayer; then taking four dice out of a great heap that lay ready, they threw them upon the table, and as all the dice had particular marks, they were interpreted, and the anſwer given by conſulting a book kept for that purpoſe. 8. At Patræ, a city on the ſea-coaſt of Achaia, was a temple of Ceres, before which was a fountain which delivered oracles only on the event of diſeaſes, by letting down a looking-glaſs ſo low, that the bottom might juſt touch the ſurface of the water; when from the various figures repreſented in it, conjectures were formed concerning the patient. Beſides theſe, there were ſeveral others, as that of Æſculapius at Epidaurus, that of Bacchus at Amphiclea, that of Orpheus's head at Leſbos, &c.

ORACH, *Atriplex*, in botany. See the article ATRIPLEX.

ORAL, ſomething delivered by word of mouth, without being committed to writing; in which ſenſe we ſay, oral law, oral tradition, &c.

ORANGE, a delicious fruit of the apple kind, too well known to need deſcription.

This fine tree not being natural to our climate, we muſt quicken the nature of our ſoil with a compoſition that may cauſe it to correſpond as much as poſſible with the temperament of warmer countries. It delights greatly in a ſoil that is compoſed of an equal quantity of ſheep's dung that has reſted two years; old compoſt, or the ſoil of a ſewer; and fat land taken either from a marſh or hemp-cloſe.

When the proper ſeaſon is arrived for lodging your young ſtems in boxes, theſe latter ſhould always be proportioned to the heads of the plants. The ſtems, even when they are become vigorous, will accommodate themſelves to a box of about fifteen inches diameter; but they muſt be placed more at large in others, when the tree ceaſes to augment its foliage, and informs you, by its languid air, that its ſoil and ſuſtenance are inſufficient. At the end of ſeven or eight years, they may be tranſplanted, with all their earth, into their laſt boxes, whoſe diameters may be about twenty-four inches. All theſe boxes ſhould be made of entire heart of oak, and caſed over with a double coat of green paint liquified with oil, as alſo on the inſide, in order to preſerve the wood from rotting by frequent waterings, as it is on the outſide, to ſecure it from rain and ſun.

The large boxes ſhould have a door with double hinges, and two iron bars to admit the proper renovations of ſoil, and to enable you to clear the box of that liquid ſediment that is collected and thickened at the bottom; and likewiſe to pare off the extreme parts of the mould, that it may afterwards be taken out with eaſe, when it is neceſſary to transfer it into a new box.

In order to place ſome ſhrubs, and more eſpecially orange trees, in boxes, after a proper manner, the firſt proceeding is to cover the bottom of the boxes with large pieces of brick and potſherds, which afford the water an eaſy flow through the cavities that are opened at the bottom. Were it not from this precaution, the humidity collected by the ſediment would rot the box and deſtroy the tree by an immoderate chilneſs. When this proviſion has been made for the ſecurity of the tender plant, the bottom and ſides of the box muſt be lined with good ſoil, prepared

in

in the manner already mentioned: in this ſoil the tree ſhould be inverted in an upright poſition, and the ball of earth at its roots muſt be leſſened, not with an intention to ſtrengthen the tree, but rather to prevent its requiring a large quantity of earth, and to confine it by a moderate vigour to a juſt proportion with the box. A new maſs of earth muſt then be heaped up on every ſide, and preſſed with a due compactneſs, in order to ſecure the ſtem from violent winds, and cauſe the earth to ſettle round the root with as much exactneſs as poſſible.

When the tree is to be placed in the box, care ſhould be taken to raiſe the upper part of the clod of the earth at its roots higher than the rim of the box, becauſe the weight of the tree and the action of the roots will afterwards lower the clod by degrees to a level with the edge of the box. If this precaution be neglected, the tree in proceſs of time will ſink too low. And, that the upper part of the clod may not be expoſed to the air, it ſhould be covered over with earth, and the whole ſuſtained by ſmooth ſtaves diſpoſed round the edges of the box.

When fruit trees are to be pruned, care ſhould be taken to preſerve the ſmall branches in a thriving ſtate, in order to promote their fertility; but they are retrenched in an orange tree, that a vacancy may be opened within. The ſame method is taken with the branches that ſhoot downwards in a perpendicular direction; and alſo with thoſe that are diveſted of their leaves, which only happens, when the tree is weak or diſtempered: but we carefully preſerve all the vigorous branches, whoſe advantageous ſituation contributes to the regularity of the head.

Oranges are brought from ſeveral parts. The beſt and moſt in eſteem for a good taſte are thoſe which grow in hot countries; not only becauſe the ſoil of the places, having ſtore of exalted ſulphur and volatile ſalts in it, communicates a great quantity of the ſame to theſe fruits, and gives them an agreeable ſmell, but becauſe the heat of the ſun there digeſts, and more completely ripens their juice, and gives them a more delicious taſte.

The juice of the orange is ſharp, becauſe this ſalt is but little embarraſſed with the ropy parts; which is the reaſon it communicates almoſt all its acidity to the little nervous fibres of the tongue. As for the juice of the ſweet oranges, as it contains leſs ſalt than that of the four ones, and as this ſalt is kept under by a great quantity of oily parts, it is eaſy to be underſtood that it can make but a ſlight impreſſion on the parts it touches.

They prefer the juice of the four orange in medicinal uſe to the other, as we before obſerved, for cooling, moiſtening, and mitigating fevers; becauſe this juice has more of the acid in it, and can more eaſily thicken the overthinned liquors, allay their violent motions, and keep down thoſe ſharp humours that throw them into an extraordinary fermentation.

ORANGERY, in gardening, a gallery expoſed to the ſouth, but well cloſed with glaſs windows, to preſerve orange trees in winter.

It likewiſe denotes the parterre where the orange trees are expoſed in kindly weather.

ORATION, in rhetoric, a ſpeech or harangue, compoſed according to the rules of oratory, and ſpoke in public.

ORATORIO, in the Italian muſic, a ſort of ſacred drama of dialogues; containing recitativos, duettos, trios, ritornellos, choruſes, &c.

The ſubjects of theſe pieces are uſually taken from the ſcriptures, or from the life of ſome ſaint, &c.

ORATORY, *Oratoria*, the art of ſpeaking well, otherwiſe called rhetoric. See the article RHETORIC.

ORATORY, among the Romaniſts, a cloſet or like apartment near a bed-chamber, furniſhed with an altar, crucifix, &c. for private devotion.

ORB, *Orbis*, in aſtronomy, &c. denotes an hollow globe or ſphere. See GLOBE and SPHERE.

ORBICULARE Os, in anatomy, a little bone of the ear, ſo called from its figure. See the article EAR.

ORBICULARIS, in anatomy, an appellation given to the conſtrictor muſcle of the lips; as alſo to the conſtrictor of the upper eye-lid.

ORBIS MAGNUS, in aſtronomy, denotes the earth's orbit, in its annual revolution round the ſun.

ORBIT, *Orbita*, in aſtronomy, the path deſcribed by a planet about the ſun.

The orbits of all the planets are ellipſes, having the ſun in their common focus; but the elliptic orbit of the earth, by the action of the moon, is ſenſibly diſfigured, as alſo the orbit of Saturn by the action of Jupiter, when they are in conjunction. See PLANET.

ORCHARD, a ſeminary, or plantation of fruit-trees.

It is a rule among gardeners, that thoſe orchards thrive beſt which lie open to the ſouth, ſouth-weſt, and ſouth-eaſt, being ſcreened from the north, and have the ſoil dry and deep.

In planting of an orchard, great care ſhould be had to the nature of the ſoil, that ſuch trees as are adapted to grow upon the ground intended to be planted, may be choſen, otherwiſe there can be little hopes of their ſucceeding; and it is for want of rightly obſerving this method, that we ſee, in many countries, orchards planted which never arrive to any tolerable degree of perfection, their trees ſtarving, and their bodies either covered with moſs, or the bark cracks and divides; both which are evident ſigns of the weakneſs of the trees; whereas, if inſtead of apples the orchard had been planted with pears, cherries, or any other ſort of fruit to which the ſoil had been adapted, the trees might have grown very well, and produced great quantities of fruit.

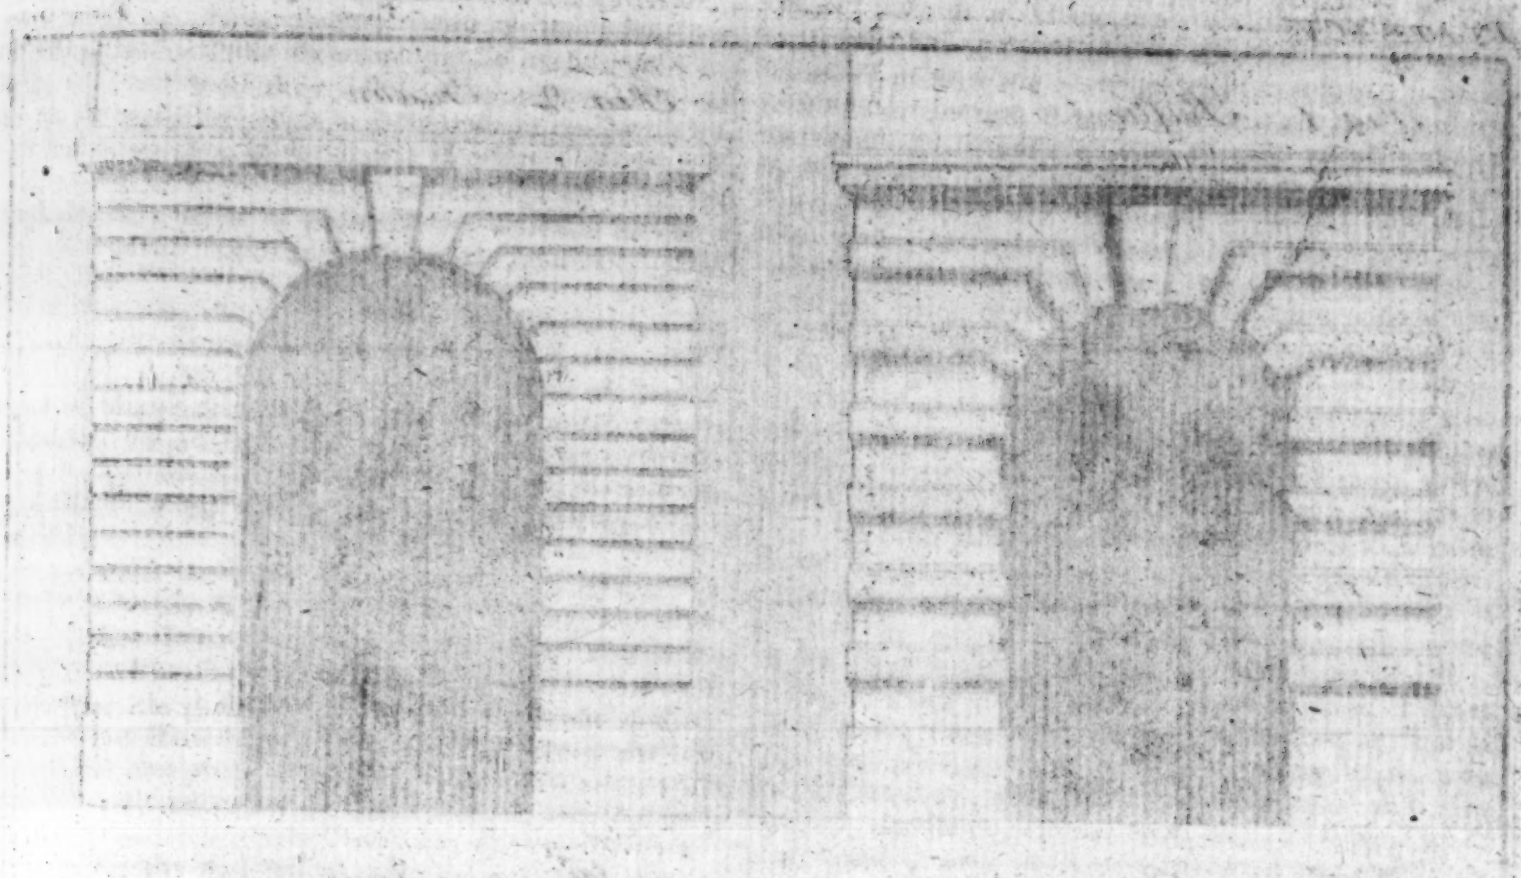
As to the poſition of the orchard, if you are at full liberty to chuſe, a riſing ground, open to the ſouth-eaſt, is to be preferred; but I would by no means adviſe to plant upon the ſide of an hill, where the declivity is very great; for in ſuch places the great rains commonly waſh down the better part of the ground, whereby the trees would be deprived of proper nouriſhment; but where the riſe is gentle, it is of great advantage to the trees, by admitting the ſun and air between them, better than it can upon an entire level; which is an exceeding benefit to the fruit, by diſſipating fogs, and drying up the damps, which, when detained amongſt the trees, mix with the air, and render it rancid: if it be defended from the weſt, north, and eaſt-winds, it will alſo render this ſituation ſtill more advantageous; for it is chiefly from theſe quarters that fruit-trees receive the greateſt injury: therefore, if the place be not naturally defended from theſe by riſing hills, which is always to be preferred, then you ſhould plant large growing timber-trees at ſome diſtance from the orchard, to anſwer this purpoſe.

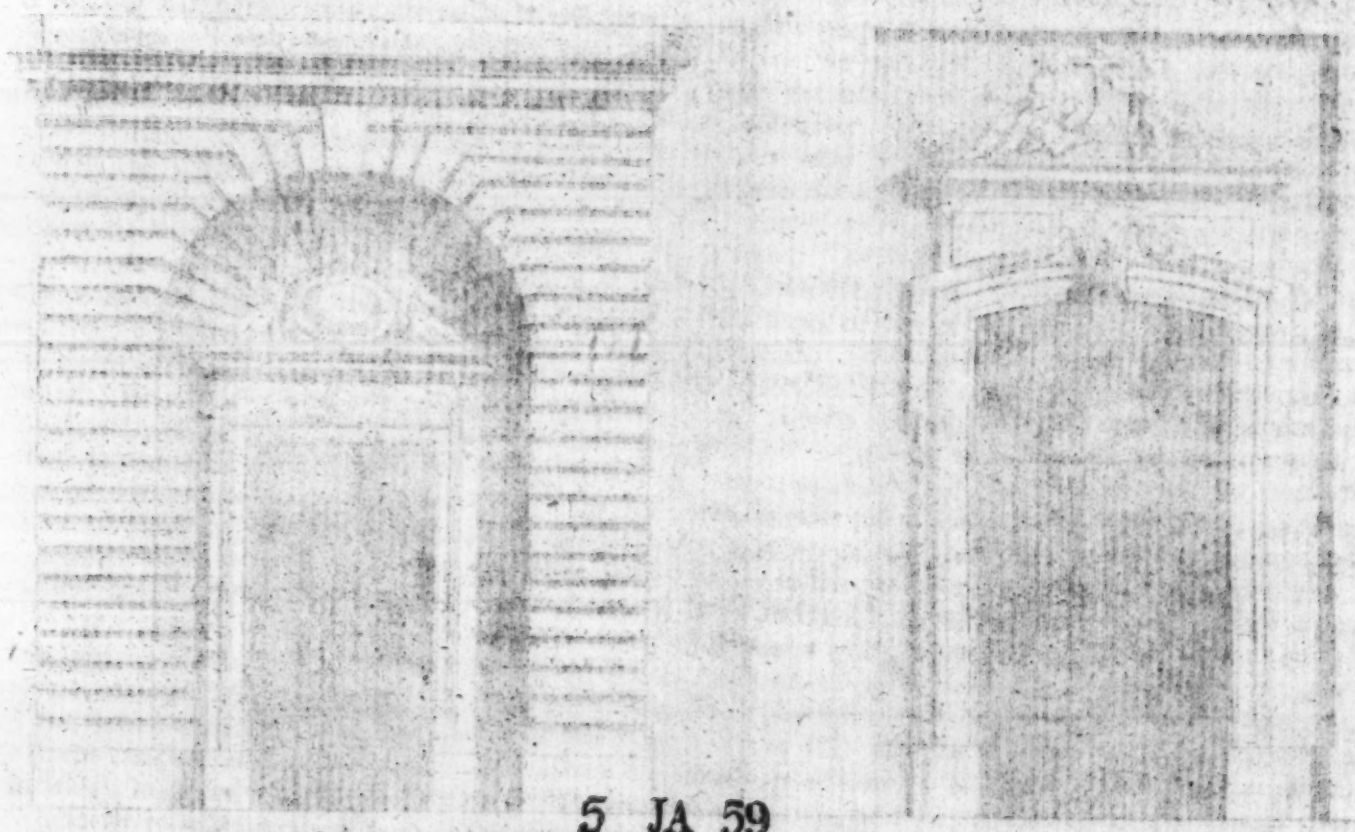
You ſhould alſo have a great regard to the diſtance of planting the trees, which is what few people have rightly conſidered; for if you plant them too cloſe, they will be liable to blights; and the air, being hereby pent in amongſt them, will cauſe the fruit to be ill-taſted, having a great quantity of damp vapours from the perſpiration of the trees, and the exhalations from the earth mixed with it, which will be imbibed by the fruit, and render their juices crude and unwholeſome.

Wherefore I cannot but recommend the method which has been lately practiſed by ſome particular gentlemen with very great ſucceſs; and that is, to plant the trees fourſcore feet aſunder, but not in regular rows. The ground between the trees they plough and ſow with wheat and other crops, in the ſame manner as if it were clear from trees; and they obſerve their crops to be full as good as thoſe quite expoſed, except juſt under each tree, when they are grown large, and afford a great ſhade; and, by thus ploughing and tilling the ground, the trees are rendered more vigorous and healthy, ſcarcely ever having any moſs, or other marks of poverty, and will abide much longer, and produce better fruit.

If the ground in which you intend to plant an orchard has been paſture for ſome years, then you ſhould plough in the green ſward the ſpring before you plant the trees: and, if you will permit it to lie a ſummer fallow, it will greatly mend it, provided you ſtir it two or three times, to rot the ſward of graſs, and prevent weeds growing thereon.

At Michaelmas you ſhould plough it pretty deep, in order to make it looſe for the roots of the trees, which ſhould be planted thereon in October, provided the ſoil be





5 JA 59

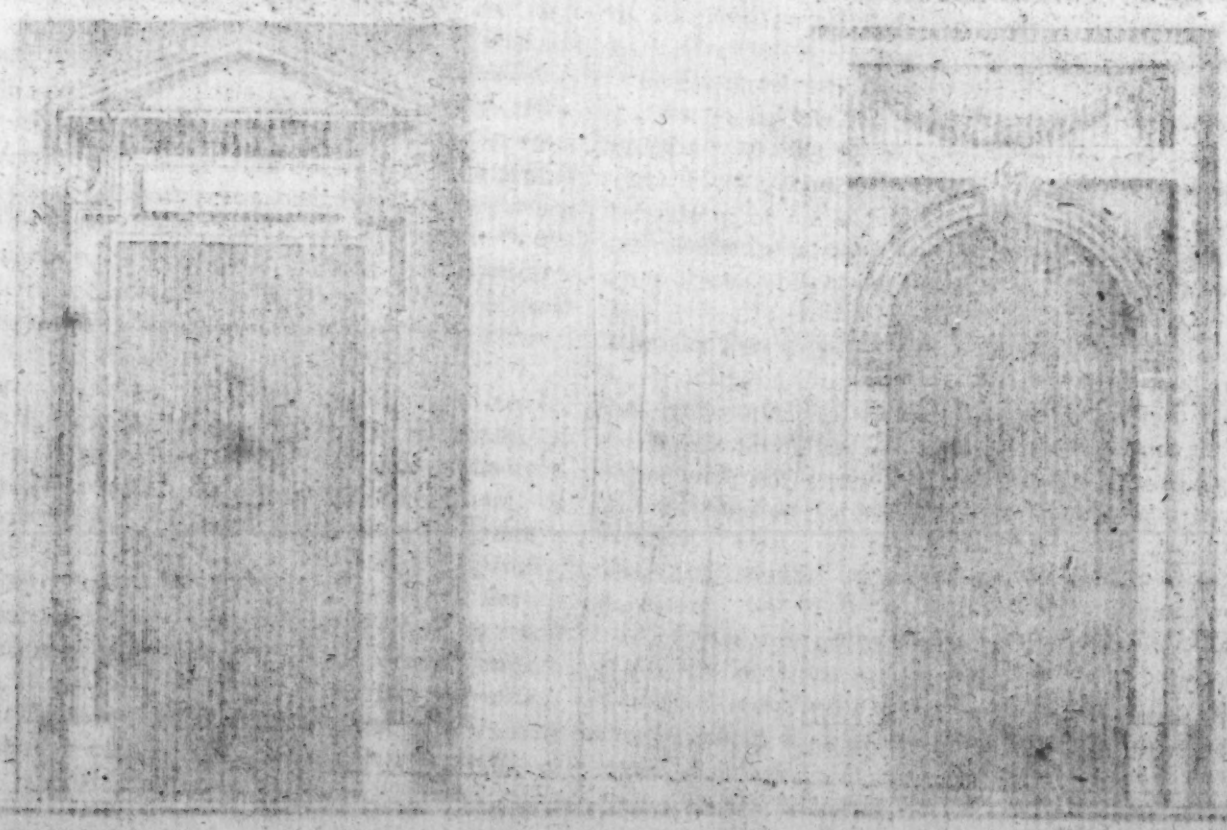


Fig. 1. Ruſtic.

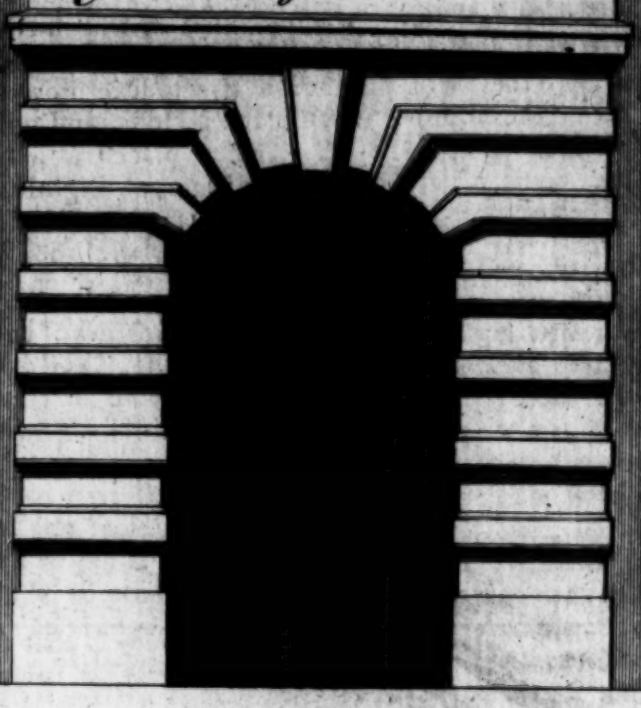

Fig. 2. Tuscan.

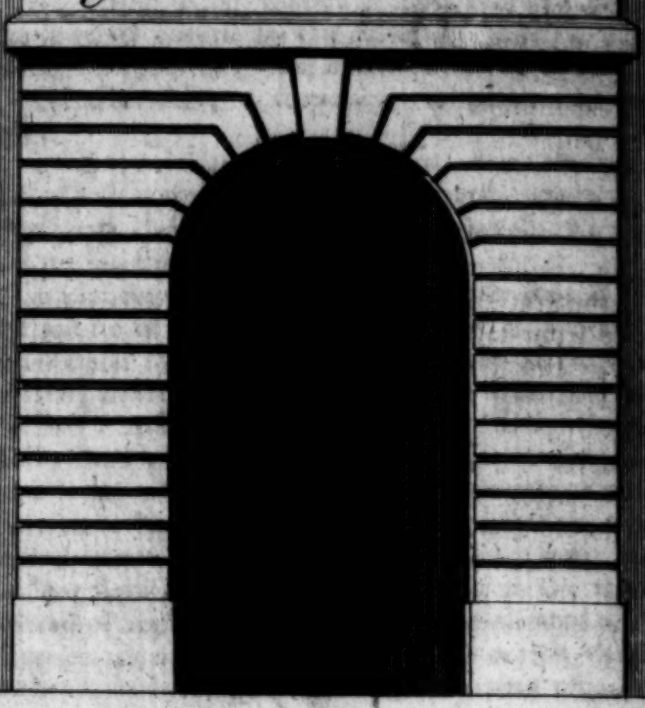

Fig. 3. Doric.

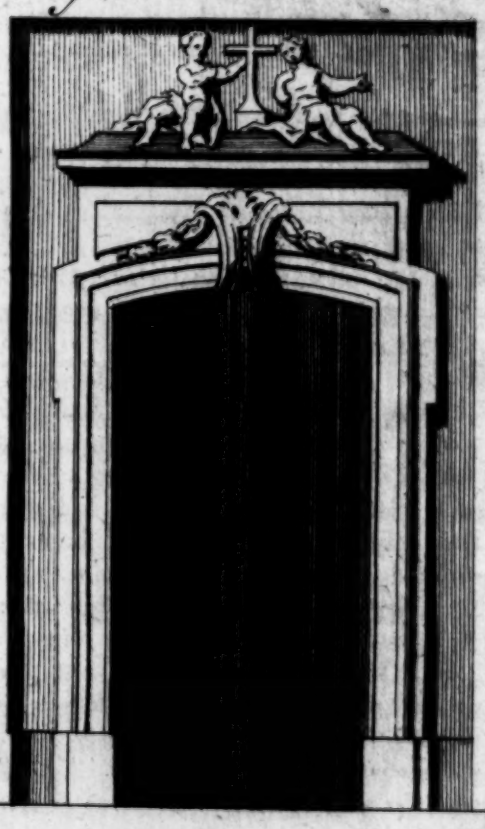

Fig. 4. Ionic.

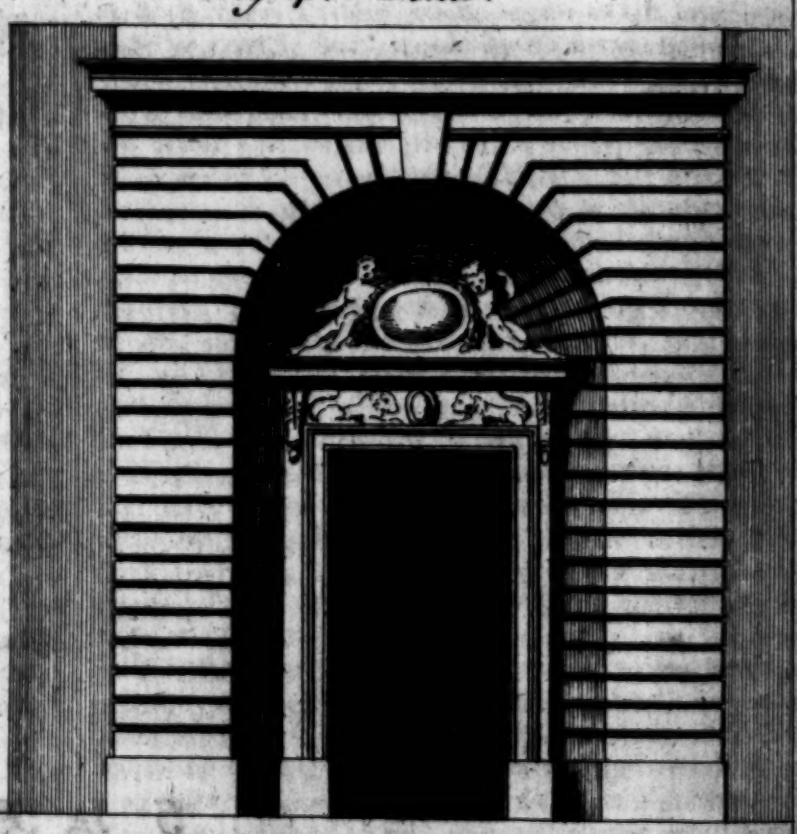

Fig. 5. Corinthian.

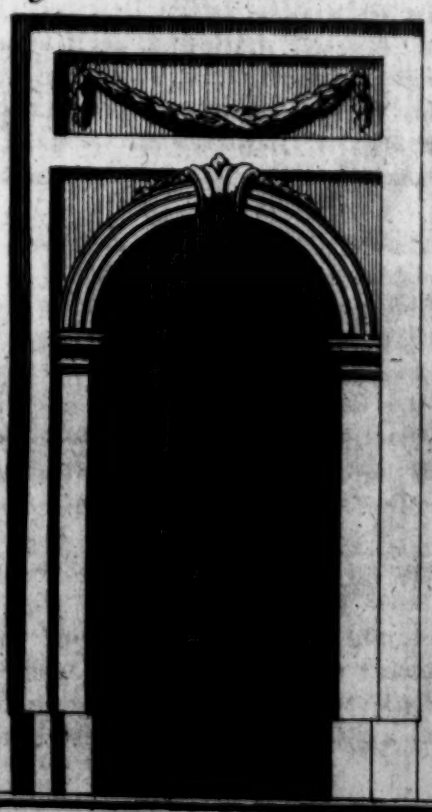

Fig. 6. Composite.

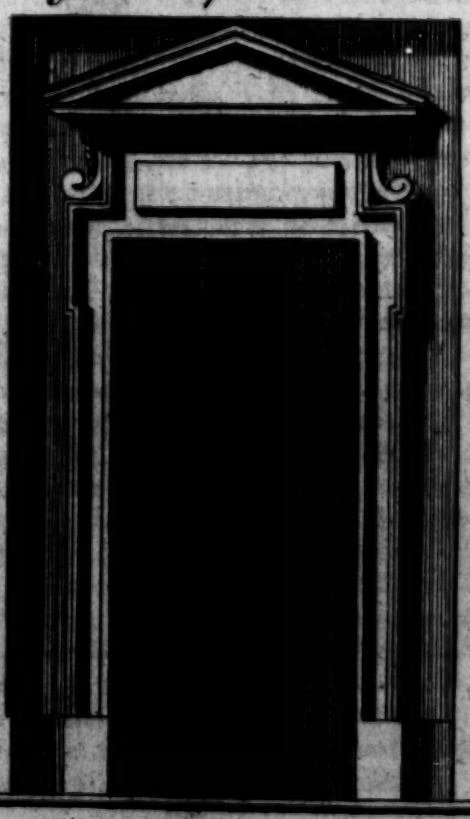

be dry; but, if it be moiſt, the beginning of March will be a better ſeaſon.

When you have finiſhed planting the trees, you ſhould provide ſome ſtakes to ſupport them, otherwiſe the wind will blow them out of the ground; which will do them much injury, eſpecially if they have been planted ſome time; for, the ground at that ſeaſon being warm, and for the moſt part moiſt, the trees will very ſoon puſh out a great number of young fibres; which, if broken off by their being diſplaced, will greatly retard the growth of them.

In the ſpring following, if the ſeaſon ſhould prove dry, you ſhould cut a quantity of green turf, which muſt be laid upon the ſurface of the ground about their roots, turning the graſs downward; which will prevent the ſun and wind from drying the ground, whereby a great expence of watering will be ſaved: and, after the firſt year, they will be out of danger, provided they have taken well.

Whenever you plough the ground between theſe trees, you muſt be careful not to go too deep among their roots, leſt you ſhould cut them off, which would greatly damage the trees: but, if you do it cautiouſly, the ſtirring of the ſurface of the ground will be of great benefit to them; though you ſhould obſerve never to ſow too near the trees, nor ſuffer any great rooting weeds to grow about them, which would exhauſt the goodneſs of the ſoil, and ſtarve them.

If, after the turf which was laid round the trees be rooted, you dig it in gently about the roots, it will greatly encourage them. There are ſome perſons who plant many ſorts of fruit together in the ſame orchard, mixing the trees alternately; but this is a method which ſhould always be avoided; for hereby there will be a very great difference in the growth of the trees, which will not only render them unſightly, but alſo the fruit upon the lower trees ill taſted, by the tall ones overſhadowing them; ſo that, if you are determined to plant ſeveral ſorts of fruit on the ſame ſpot, you ſhould obſerve to place the largeſt-growing trees backwards, and ſo proceed to thoſe of leſs growth, continuing the ſame method quite through the whole plantation; whereby it will appear at a diſtance in a regular ſlope, and the ſun and air will more equally paſs through the whole orchard, that every tree may have an equal benefit therefrom.

The ſoil of your orchard ſhould alſo be mended once in two or three years with dung, or other manure, which will alſo be abſolutely neceſſary for the crops ſown between; ſo that where perſons are not inclinable to help their orchard, where the expence of manure is pretty great; yet, as there is a crop expected from the ground beſides the fruit, they will the more readily be at the charge upon that account.

In making choice of trees for an orchard, you ſhould always obſerve to procure them from a ſoil nearly a-kin to that where they are to be planted, or rather poorer; for, if you have them from a very rich ſoil, and that wherein you plant them is but indifferent, they will not thrive well, eſpecially for four or five years after planting; ſo that it is a very wrong practice to make the nurſery, where young trees are raiſed, very rich, when the trees are deſigned for a middling or poor ſoil. The trees ſhould alſo be young and thriving; for, whatever ſome perſons may adviſe to the contrary, yet it has always been obſerved, that though large trees may grow, and produce fruit, after being removed, they never make ſo good trees, nor are ſo long-lived, as thoſe which are planted while young.

Theſe trees, after they are planted out, will require no other pruning but only to cut out dead branches, or ſuch as croſs each other, ſo as to render their heads confuſed and unſightly: the too often pruning them, or ſhortening their branches, is very injurious; eſpecially to cherries and ſtone fruit, which will gum prodigiouſly, and decay in ſuch places where they are cut: and the apples and pears, which are not of ſo nice a nature, will produce a greater quantity of lateral branches, which will fill the heads of the trees with weak ſhoots, whenever their branches are thus ſhortened; and many times the fruit is hereby cut off, which, on many ſorts of fruit-trees, is firſt produced at the extremity of their ſhoot.

It may, perhaps, ſeem ſtrange to ſome perſons, that I ſhould recommend the allowing ſo much diſtance to the trees in an orchard, becauſe a ſmall piece of ground will admit of very few trees, when planted in this method: but they will pleaſe to obſerve, that, when the trees are grown up, they will produce a great deal more fruit than twice the number when planted cloſe, and will be vaſtly better taſted; the trees, when placed at a large diſtance, being never ſo much in danger of blighting as in cloſe plantations, as hath been obſerved in Herefordſhire, the great county for orchards, where they find that when orchards are ſo planted or ſituated, that the air is pent up amongſt the trees, the vapours which ariſe from the damp of the ground, and the perſpiration of the trees, collect the heat of the ſun, and reflect it in ſteams ſo as to cauſe what they call a fire-blaſt, which is the moſt hurtful to their fruit; and this is moſt frequent where the orchards are open to the ſouth ſun.

But, as orchards ſhould never be planted, unleſs where large quantities of fruit are deſired, ſo it will be the ſame thing to allow twice or three times the quantity of ground; ſince there may be a crop of grain of any ſort upon the ſame place, as was before ſaid, ſo that there is no loſs of ground: and, for a family only, it is hardly worth while to plant an orchard; ſince a kitchen garden well planted with eſpaliers will afford more fruit than can be eaten while good, eſpecially if the kitchen garden be proportioned to the largeneſs of the family: and, if cyder be required, there may be a large avenue of apple-trees extended croſs a neighbouring field, which will render it pleaſant, and produce a great quantity of fruit; or there may be ſome ſingle rows of trees planted to ſurround the fields, &c. which will fully anſwer the ſame purpoſe, and be leſs liable to the fire-blaſts before-mentioned. *Miller's Gard. Dict.*

ORCHESTRA, in the ancient theatres, a place in the form of a ſemi-circle, where the dancing was performed.

ORCHIS, fool's-ſtones, in botany, a genus of plants, the corolla of which is of a coniculated form; and its fruit is an oblong unilocular capſule, containing numerous ſcobiform ſeeds.

Orchis root abounds with a glutinous juice, good for blunting acrid ſerous humours: it is alſo accounted an aphrodiſiac, but on no good foundation.

ORDEAL, a form of trial, or of diſcovering innocence or guilt, formerly practiſed over almoſt all Europe, and which prevailed in England from the time of Edward the Confeſſor, till it was aboliſhed by a declaration of Henry III. It was called *purgatio vulgaris*, or *judicium*, in oppoſition to *bellum* or combat, the other form of purgation, and was of various kinds, as that of fire, that of red-hot iron, that of water, that of judicial pottage, that of hallowed cheeſe, that of the green croſs, and that of dice laid on relics covered with a woollen cloth. To each of which kinds particular maſſes were appointed.

In England, an offender, on being arraigned and pleading not guilty, had it in his choice to put himſelf upon God and his country; that is, upon the verdict of a jury; or upon God alone, on which account it was called the judgement of God, it being preſumed that God would deliver the innocent. The more popular kinds of ordeal were thoſe of red-hot iron and water; the firſt for freemen and people of faſhion, and the laſt for peaſants. That by fire, as practiſed here, was the perſon's walking barefooted and blindfold over nine red-hot plough-ſhares; and if he eſcaped unhurt, he was acquitted, otherwiſe condemned. That of water was of two kinds, viz. either with hot water or cold; the former was where the perſon ſuſpected put his arm or leg into ſcalding water, and brought it out unhurt; and the latter was when his body was not, contrary to the courſe of nature, borne up by the water.

ORDER, in architecture, is a ſyſtem of the ſeveral members, ornaments, and proportions of columns and pilaſters; or a regular arrangement of the projecting parts of a building, eſpecially the column, ſo as to form one beautiful whole.

M. Le Clerc defines an order to be a column charged with an entablature, and ſupported on a pedeſtal.

The origin of orders may be ſaid to be almoſt as ancient as human ſociety. The rigour of the ſeaſons firſt put men upon making little cabbins to retire into: at the firſt they were made half under ground, and half above, and were covered with ſtubble; but, in time growing more expert, they placed trunks of trees on end, and laid others a-croſs, to bear up the covering.

From hence they took the hint of more regular architecture, the trunks of trees upright repreſenting columns; and the girds or bands which ſerved to keep the trunks from burſting, expreſſed baſes and capitals; and the ſummers which lay a-croſs, gave the hint of entablatures; and likewiſe, the coverings, ending in points, gave a notion of pediments. This hypotheſis we have from Vitruvius, and it has been well illuſtrated by M. Blondel. See the article COLUMN, &c.

Others are of opinion that columns take their riſe from the pyramids which were erected by the ancients over tombs; and that the urns wherein their aſhes were incloſed, repreſented the capitals, the abacus of which was a brick laid over to cover the urn: but Vitruvius's account ſeems the moſt natural. See the article ABACUS, &c.

In time, the height of columns was regulated by the Greeks on the foot of the proportion of a human body. The Doric repreſented a man of a ſtrong robuſt make, the Ionic that of a woman, and the Corinthian that of a girl; their baſes and capitals were their ſhoes, head-dreſs, &c.

The three Greek orders repreſent three different manners of building, viz. the ſolid, mean, and delicate; the two Italian ones are imperfect productions of theſe.

The little regard the Romans had for the laſt, appears from this, that we meet not with one inſtance in the antique where they are intermixed.

Daviler obſerves, that the abuſe the moderns have introduced by the mixture of the Greek and Latin orders, ariſes from their want of reflection on the uſe which the ancients made thereof.

To give a general idea of the orders, it will be neceſſary to obſerve that the whole is compoſed of two parts, at leaſt, viz. the column and the entablature; and of four parts, at the moſt, where there is a pedeſtal under the column, and one acroter or little pedeſtal on the top of the entablature.

That the column has three parts, viz. the baſe, the ſhaft, and the capital: the entablature has three likewiſe, viz. the architrave, the frieze, and the corniche; which parts are all different in the ſeveral orders, having each their particular characters and members called by the general names of mouldings or ornaments. See the article BASE, &c.

Theſe orders took their names from the people among whom they were invented. Scamozzi calls the Tuſcan, the gigantic; the Doric, the Herculean; the Ionic, the matronal; the Compoſite, the heroic; and the Corinthian, the virginal.

An order of columns is uſually underſtood of a column bearing its entablature; but the order is ſcarcely complete, except the column be raiſed on a pedeſtal.

The pedeſtal, column, and entablature, are three compound parts, each conſiſting of three others, as has been ſaid before.

The ancients have given us five ſeveral orders of columns, the Tuſcan, Doric, Ionic, Compoſite, and Corinthian.

Under the artiele COLUMN we have given a plate of the five orders, and ſhall here add another of doors adapted to the different orders. See plate XCV. where *fig* 1. is a door according to the Ruſtic taſte. Fig. 2. A door of the Tuſcan order. Fig. 3. A door of the Doric order. Fig. 4. A door of the Ionic order. Fig. 5 A door of the Corinthian order; and *fig*. 6. a door of the Compoſite order.

Diſpoſition of the ORDERS. Theſe ought to be ſo diſpoſed in building, that the moſt ſolid may be placed undermoſt; as being the moſt proper to ſuſtain the weight, and to give the whole edifice a more firm foundation: therefore the Doric muſt always be placed under the Ionic the Ionic under the Corinthian, and the Corinthian under the Compoſite. As to the Tuſcan, being a plain rude order, it is ſeldom uſed above ground except in villas, where one order only is employed. In very large buildings, as amphitheatres, where many orders are required, the Tuſcan may be placed under the Ionic inſtead of the Doric. But if you are deſirous to leave out any of theſe orders, as for inſtance, to place the Corinthian immediately over the Doric, you may, provided you always obſerve to place the moſt ſtrong and ſolid undermoſt, for the reaſons above-mentioned.

ORDER is alſo uſed for a diviſion or claſs of any thing: thus, the tribe of animals called birds, is ſubdivided into ſix orders. See the article ORNITHOLOGY.

Holy ORDERS, a character peculiar to eccleſiaſtics, whereby they are ſet apart for the miniſtry.

Military ORDERS are companies of knights, inſtituted by kings and princes; either for defence of the faith, or to confer marks of honour, and make diſtinctions among their ſubjects.

Religious ORDERS are congregations or ſocieties of monaſtics, living under the ſame ſuperior, in the ſame manner, and wearing the ſame habit.

ORDERS *of Curves*, in geometry. See the article CURVE.

ORIGINAL NUMBERS. See NUMBER.

ORDINANCE, or ORDONNANCE, a law, ſtatute, or command of a ſovereign, or ſuperior.

ORDINARY, in general, ſignifies common, uſual; thus, an ambaſſador or envoy in ordinary, is one ſent to reſide ſtatedly, and for a number of years, in the court of ſome foreign prince or ſtate, in order to keep up a good underſtanding, and watch over the intereſt of his own nation.

This term is alſo applied to ſeveral officers in the king's houſhold, who attend on common occaſions. Thus we ſay, phyſician in ordinary, &c.

ORDINARY, in civil law, is any judge inveſted with authority to take cognizance of cauſes in his own right, and not by deputation.

ORDINARY, in common and canon law, is one who has ordinary or immediate juriſdiction in eccleſiaſtical cauſes in ſuch a place.

ORDINARY, or *Honourable* ORDINARY, in heraldry, a denomination given to certain charges properly belonging to that art. The honourable ordinaries are ten in number; viz. the chief, pale, bend, feſſe, bar, croſs, ſaltier, chevron, bordure, and orle.

ORDINATES, or ORDINATE APPLICATES, in geometry, are parallel lines, terminating in a curve, and biſſected by a diameter. The half of theſe is properly the ſemi-ordinate, though commonly called ordinate. See CURVE, PARABOLA, HYPERBOLA, &c.

ORDINATION, the act of conferring holy orders, or of initiating a perſon into the prieſthood by prayer, and the laying on of hands. Ordination has always been eſteemed the principal prerogative of biſhops, and they ſtill retain the function as a mark of ſpiritual ſovereignty in their dioceſe. Without ordination, no perſon can receive any benefice, parſonage, vicarage, &c. A clerk muſt be twenty-three years of age before he can have any ſhare in the miniſtry; and twenty-four, before he can be ordained, and by that means be permitted to adminiſter the ſacraments. A biſhop, on the ordination of clergymen, is to examine them in the preſence of the miniſters who aſſiſt him at the impoſition of hands; and in caſe any crime, as drunkenneſs, perjury, forgery, &c. be alledged againſt any one that is to be ordained, either prieſt or deacon, the biſhop ought to deſiſt from ordaining him. The perſon to be ordained is to bring a teſtimonial of his life and doctrine to the biſhop, and give an account of his faith in Latin, and both prieſts and deacons are obliged to ſubſcribe the thirty-nine articles.

ORDNANCE, a general name for all ſorts of great guns uſed in war. See CANNON and GUN.

ORDONNANCE, or ORDINANCE, in painting, is uſed for the diſpoſition of the parts of a picture, either with regard to the whole piece, or to the ſeveral parts; as the groups, maſſes, contraſts, aſpects, &c.

In

In the ordonnance there are three things to be regarded, viz. the place or ſcene, the diſtribution, and the contraſt.

1. As to the firſt, regard is to be had to the diſpoſition of things which ſerve as a ground-work; and to the plan and poſition of bodies; under the former of which comes the landſkip, whether an uninhabited place, where there is full liberty of repreſenting all the extravagancies of nature; or inhabited, where the ſigns of cultivation, &c. muſt be exhibited. See LANDSKIP.

As to the plan of bodies, they are either ſolid, which again are either ſo by nature, and muſt be proportioned to their places; or artificial, where regard muſt be had to the rules of geometry, perſpective, architecture, &c. Or the bodies move; which they do either by a voluntary motion, wherein great regard muſt be had to proportion them to their ſituation, and to ſtrengthen them by regarding the equilibrium; or by ſome extraordinary power, as machines, &c. where the cauſes of their motion muſt appear. Or they are things at a diſtance, in all which an even plane muſt ſtill be propoſed, to find their preciſe ſituation, and ſettle their place by ſudden breaks and diſtances agreeably to perſpective.

In placing the figures, regard is to be had, 1. To the group, which connects the ſubject, and ſtays the ſight. In this are to be conſidered the knot or nodus, which binds the group, and the nearneſs of figures, which as it holds them together, may be called the chain; that the group be ſuſtained by ſomething looſe and diſtinct from it, and by the ſame joined and continued to the other groups; and that the lights and ſhadows be ſo diſpoſed, as that the effects of all the parts of a compoſition may be ſeen at once. See GROUP.

2. As to the actions, forced attitudes are to be avoided, and ſimple nature ſhould be ſhewn in her moſt advantageous poſtures.

3. As to the drapery, which is to be adjuſted, ſo as it may appear real garments, and not ſtuff looſely thrown on.

4. In the contraſt, are to be conſidered the actions, which vary infinitely; the aſpects which in actions of the ſame kind, may, by their difference, make a contraſt; the ſituation, according as they meet above, or under the ſight, or are near or at a great diſtance. And laſtly, cuſtom, which indeed extends to all the parts of painting: though this is particularly to be regarded in the ordonnance, it is nevertheleſs to be followed with diſcretion, taking care to avoid all ſtiffneſs and formality.

ORDONNANCE, in architecture, is the compoſition of a building, and the diſpoſition of its parts, both with regard to the whole, and to one another; or, as Mr. Evelyn expreſſes it, determining the meaſure of what is aſſigned to the ſeveral apartments.

ORE, in natural hiſtory, the mineral glebe, earth or ſtone dug out of the mines, to be purified, and have the metalline particles ſeparated from it.

ORGAN, *ὀργανον*, in general, is an inſtrument, or machine deſigned for the production of ſome certain action or operation; in which ſenſe, the mechanic powers, machines, and even the veins, arteries, nerves, muſcles, and bones of the human body, may be called organs.

The organs of ſenſe are thoſe parts of the body, by which we receive the impreſſions or ideas of external objects; being commonly reckoned five, viz. the eye, ear, noſe, palate, and cutis.

ORGAN, in muſic, the largeſt and moſt harmonious wind-inſtrument.

The invention of the organ is very ancient, though it is agreed that it was vey little uſed till the eighth century. It ſeems to have been borrowed from the Greeks. Vitruvius deſcribes an hydraulic one in his tenth book of Architecture.

St. Jerome mentions one with twelve pair of bellows, which might be heard a thouſand paces, or a mile; and another at Jeruſalem, which might be heard at the mount of Olives.

There is one in the cathedral church of Ulm, in Germany, that is ninety-three feet high; and twenty eight broad; the biggeſt pipe is thirteen inches in diameter, and it has ſixteen pair of bellows.

The organ has at leaſt one ſet of keys, when it has only one body, and two or three when it has a poſitive or chair-organ: though large organs have four, and ſometimes five ſets of keys; beſides which, the pedals or largeſt pipes have their keys, the ſtops or touches whereof are played by the feet. The keys of an organ are uſually divided into four octaves, viz. the ſecond ſub-octave, firſt ſub-octave, middle octave, and firſt octave. Each octave is divided into twelve ſtops or frets, whereof the ſeveral black ones mark the natural ſounds, and the five white, the artificial ones, that is, the ſharps and flats; ſo that the keys uſually contain forty eight ſtops, or touches. Some organiſts add to this number one or more ſtops in the third ſub-octave as well as in the ſecond. Note, ſome harpſicords and ſpinnets have their natural ſtops or keys often marked white, and their artificial ones black. The pedals have about two or three octaves, at the pleaſure of the organiſt, ſo that the number of ſtops is indeterminate.

Each key or ſtop preſſed down, opens a valve or plug which correſponds lengthwiſe with as many holes as there are rows of pipes on the ſound-board: the holes of each row are opened and ſhut by a regiſter, or ruler pierced with forty-eight holes; by drawing the regiſter, the holes of one row are opened, becauſe the holes therein correſpond with thoſe of the ſound-board, ſo that by opening a valve, the wind brought into the ſound board, by a large pair of bellows, finds a paſſage into the pipes, which correſpond to the open holes of the ſound-board; but by puſhing the regiſter, the forty-eight holes thereof not anſwering to any of thoſe of the ſound-board, that row of pipes anſwering to the puſhed regiſter are ſhut. Whence it follows, that by drawing ſeveral regiſters, ſeveral rows of pipes are opened; and the ſame thing happens, if the ſame regiſter correſpond to ſeveral rows. Hence the rows of pipes become either ſimple or compound: ſimple, when only one row anſwers to one regiſter; compound, where ſeveral. The organiſts ſay, a row is compound, when ſeveral pipes play upon preſſing one ſtop.

The pipes of the organ are of two kinds; the one with mouths like our flutes; the other with reeds. The firſt, called pipes of mutation, conſiſt, 1. of a foot A A B B (plate XCIV. *fig.* 9.) which is a hollow cone, and which receives the wind that is to ſound the pipe. 2. To this foot is faſtened the body of the pipe B B D D. Between the foot and the body of the pipe is a diaphragm or partition, F E F, which has a long, but narrow aperture to let the wind out. Over this aperture is the mouth B B C; whoſe upper lip C, being level, cuts the wind as it comes out at the aperture.

The pipes are of pewter, of lead mixed with a twelfth part of tin, and of wood. Thoſe of pewter are always open at their extremities: their diameter is very ſmall, and their ſound very clear and ſhrill. Thoſe of lead, mixed with tin, are larger; the ſhorteſt open, the longeſt are quite ſtopped; the mean ones partly ſtopped, and having beſides a little ear on each ſide the mouth, to be drawn cloſer, or ſet farther aſunder, in order to raiſe or lower the ſound. The wooden pipes are made ſquare, and their extremity ſtopped with a valve, or tampion of leather. The ſound of the wooden and leaden pipes is very ſoft; the large ones ſtopped, are uſually of wood; the ſmall ones of lead. The longeſt pipes give the greateſt ſound; and the ſhorteſt, the moſt acute: their lengths and widths are made in the reciprocal ratios of their ſounds; and the diviſions regulated by their rule, which they call diapaſon. But the pipes that are ſhut are of the ſame length as the open ones, which yield the ſame ſound. Uſually, the longeſt pipe is ſixteen feet: though in extraordinary organs it is thirty-two. The pedal tubes are always open, though made of wood, and of lead.

A reed-pipe conſiſts of a foot, A A B B, (*fig.* 10.) which carries the wind into the ſhalot, or reed C D, which is a hollow demi-cylinder, fitted at its extremity D, into a kind of mould, by a wooden tampion G. The ſhalot is covered with a plate of copper, K K I I, fitted at its extremity I I, into the mould by the ſame wooden tampion. Its other extremity K K, is at liberty; ſo that the air entering the ſhalot, makes it tremble or ſhake againſt the reed; and the longer that part of the tongue which is at

liberty

liberty I L, is made, the deeper is the ſound. The mould I I, which ſerves to fix the ſhalot or reed, the tongue, tampion, &c. ſerves alſo to ſtop the foot of the pipe, and to oblige the wind to go out wholly at the reed. Laſtly, in the mould is ſoldered the tube H H, whoſe inward opening is a continuation of that of the reed. The form of this tube is different in the different ranks of pipes. The degree of acuteneſs and gravity in the ſound of a reed-pipe, depends on the length of the tongue, and that of the pipe C K, taken from the extremity of the ſhalot, to the extremity of the tube. The quality of the ſound depends on the width of the reed, the tongue, and the tube; as alſo on the thickneſs of the tongue, the figure of the tube, and the quantity of wind.

To diverſify the ſounds of the pipes, they add a valve to the port-vent, which lets the wind go in fits or ſhakes.

Hydraulic ORGAN denotes a muſical machine that plays by means of water inſtead of wind. Of theſe there are ſeveral in Italy in the grottos of vineyards.

ORGANICAL, in the ancient muſic, was that part performed by inſtruments. See MUSIC.

ORGANICAL *Part* is that part of an animal, or plant, deſtined for the performance of ſome particular function.

ORGANICAL *Diſeaſe*, a diſeaſe in an organical part of the body, whereby its function is impeded, ſuſpended, or deſtroyed.

ORGANICAL *Deſcription of Curves*, the method of deſcribing them on a plane by means of inſtruments.

ORGANO, in muſic, ſignifies the thorough baſs. It is uſually ſcored with figures over the notes for the harpſichord, baſs viol, and lute.

ORGANO PICCIOLO, a chamber or little organ, uſed to play in a ſmall room, being about two or three feet high, that is, its largeſt pipe is that length: it is made in a ſmall buffet, like the poſitive, or little organ of a church.

ORGASM, *Orgaſmus*, an extacy, or impetuous deſire of coition, occaſioned by a turgeſcency of the ſeminal veſſels.

ORGYIA, ὀργια, in antiquity, feaſts and ſacrifices performed in honour of Bacchus, inſtituted by Orpheus, and chiefly celebrated on the mountains, by wild, diſtracted women, called Bacchæ.

ORGUES, in the military art, are thick, long pieces of wood pointed at one end, and ſhod with iron, clear one of another; hanging each by a particular rope, or cord, over the gate-way of a ſtrong place, perpendicularly, to be let fall in caſe of an enemy. Their diſpoſition is ſuch, that they ſtop the paſſage of the gate, and are preferable to herſes or portcullíſes; becauſe theſe may be either broke by a petard, or they may be ſtopped in their falling down; but a petard is uſeleſs againſt an orgue, for if it break one or two of the pieces, they immediately fall down again, and fill up the vacancy; or if they ſtop one or two of the pieces from falling, it is no hindrance to the reſt.

ORGUES is alſo uſed for a machine, compoſed of ſeveral harquebuſs on muſquet-barrels, bound together, by means whereof ſeveral exploſions are made at the ſame time, uſed to defend breaches and other places attacked.

ORGYA, an ancient Grecian meaſure, containing ſix feet.

ORIENT, *Oriens*, in geography and aſtronomy, the eaſt, or eaſt-point of the horizon; thus called, becauſe it is in the point where the ſun riſes. Hence the equinoctial orient is uſed for that point of the horizon wherein the ſun riſes, when he is in the equator, or when he enters the ſigns of Aries and Libra; æſtival orient is the point wherein the ſun riſes in the middle of ſummer, when the days are longeſt; and the hibernal orient, the point where the ſun riſes in the middle of winter, when the days are ſhorteſt.

ORIENTAL, ſomething ſituated towards the eaſt, with regard to us, in oppoſition to occidental.

ORIFICE, the mouth or aperture of a tube, pipe, or other cavity.

In anatomy, this term is particularly applied to the mouths of the ſeveral ducts, veſſels, and other cavities, as of the bladder, uterus, ſtomach, &c.

It is alſo uſed for the aperture of a wound or ulcer.

ORIGANUM, wild marjoram, in botany, a plant with firm round ſtalks, and oval, acuminated, uncut, ſomewhat hairy leaves, ſet in pairs upon ſhort pedicles: on the tops grow ſcaly heads of pale red labiated flowers, whoſe upper lip is entire, and the lower cut into three ſegments, ſet in form of a convex umbel, intermixed with roundiſh purpliſh leaves; each flower is followed by four minute ſeeds incloſed in the cup. It grows wild on dry chalky hills and gravelly grounds, in ſeveral parts of England, and flowers in June. The flowers, or rather flowery tops, of a ſomewhat different ſpecies, *origanum Creticum*, were formerly brought from Candy, but have long given place to thoſe of our own growth, which are nearly of the ſame quality.

The leaves and flowery tops of origanum have an agreeable aromatic ſmell, and a pungent taſte, warmer than that of the garden marjoram, and much reſembling thyme; with which they appear to agree in medicinal virtue. Infuſions of them are ſometimes drank as tea, in weakneſs of the ſtomach, diſorders of the breaſt for promoting perſpiration and the fluid ſecretions in general; they are ſometimes uſed alſo in nervine and antirheumatic baths; and the powder of the dried herb as an errhine. Diſtilled with water, they yield a moderate quantity of a very acrid penetrating eſſential oil, ſmelling ſtrongly of the origanum, but leſs agreeable than the herb itſelf: this oil is applied on a little cotton for eaſing the pains of carious teeth; and ſometimes diluted and rubbed on the noſtrils or ſnuffed up the noſe, for attenuating and evacuating mucous humours.

ORIGENISTS, in church hiſtory, a Chriſtian ſect in the fourth century, ſo called from their drawing their opinions from the writings of Origen. The Origeniſts maintained, that the ſouls of men had a pre-exiſtent ſtate, that they were holy intelligences, and had ſinned in heaven before the body was created: that Chriſt is only the ſon of God by adoption; that he has been ſucceſſively united with all the angelical natures, and has been a cherub, a ſeraph, and all the celeſtial virtues, one after another; that in future ages, he will be crucified for the ſalvation of the devils, as he has already been for that of men; and that their puniſhment, and that of the damned, will continue only for a certain limited time.

ORIGINAL, a firſt draught or deſign of any thing, which ſerves as a model to be imitated or copied.

ORIGINAL SIN, the crime of eating the forbidden fruit, of which it is ſaid, all mankind are guilty at their conception, by the imputation of Adam's tranſgreſſion; which is accounted for by ſuppoſing that Adam, as he was to be the father, was alſo the fœderal head, and repreſentative of the whole human race; and that on his ſinning, all that were to ſpring from him partook of his crime.

ORILLON, in fortification, is a ſmall rounding of earth faced with a wall; raiſed on the ſhoulder of thoſe baſtions that have caſe-mates, to cover the cannon in the retired flank, and prevent their being diſmounted by the enemy.

ORION, in aſtronomy, a conſtellation of the ſouthern hemiſphere; conſiſting of thirty-ſeven ſtars, according to Ptolemy; of ſixty-two, according to Tycho; and of no leſs than eighty, in the Britannic catalogue.

ORION'S RING, in aſtronomy, a conſtellation more uſually called Eridanus. See the article ERIDANUS.

ORLE, ORLET, or ORLO, in architecture, a fillet under the ovolo or quarter round of a capital. When it is at the top or bottom of the ſhaft, it is called cincture. See CINCTURE.

Palladio uſes the word orlo, for the plinth of the baſes of columns.

ORLE, in heraldry, an ordinary in form of a fillet drawn round the ſhield, near the edge or extremity thereof, leaving the field vacant in the middle. Its breadth is but half that of the treſſure or bordure, which contains a ſixth part of the ſhield; and the orle, only a twelfth: beſides that, the orle is its own breadth diſtant

diſtant from the edge of the ſhield, whereas the bordure comes to the edge itſelf.

ORNAMENTS, in architecture, are uſed to ſignify all the ſculpture or carved-work wherewith a piece of architecture is enriched.

Vitruvius and Vignola alſo uſe the word to ſignify the entablature.

ORNITHOLOGY, that branch of zoology which treats of birds. See BIRD.

Linnæus arranges the whole claſs of birds under ſix orders, according to the different figures of their beaks, viz.

1. The accipitres, or birds with uncinated or hooked beaks.

2. The picæ, or birds that have convex and compreſſed beaks.

3. The anſeres, comprehending ſuch birds as have depreſſed, and dentated or ſerrated beaks.

4. The ſcolopaces, or thoſe furniſhed with ſubcylindric and obtuſe beaks.

5. The gallinæ, or birds which have the beak of a conic form, but crooked, and the upper chap imbricated.

6. The paſſeres, or birds with conic and ſharp-pointed beaks.

In the deſcription of birds, the feet, wings, and tail, are chiefly attended to.

In moſt birds the toes are four in number, three ſtanding forwards and one backwards.

In ſome two toes ſtand forward, and two backward. Some feet, again, are palmated, or have the toes connected together by a membrane; and others ſemi-palmated.

With regard to the wings, the long quill-feathers are called by authors remiges, as ſerving to fly with; and the other feathers, placed over the reſt of the body, tectrices. The long feathers of the tail are called rectrices, as ſerving to ſteer the bird's courſe through the air.

As to the other terms made uſe of in the deſcription of birds, they are theſe: cera expreſſes the membrane or naked tunic, which ſurrounds and extends itſelf over more or leſs of the baſe of the beak: urrhopigium is the rump; and as to other terms, they will be found explained under their ſeveral heads.

OROBUS, bitter vetch, in botany, a genus of plants, with a papilionaceous flower, and a rounded bivalve pod for its fruit, containing numerous roundiſh ſeeds.

It agrees in virtues with ervum. See the article ERVUM.

ORPELLO, in the glaſs-trade, calcined bark reduced to a black powder.

ORPHAN, a fatherleſs child, or minor; or one that is deprived both of father and mother.

ORPIMENT, *Auripigmentum*, in natural hiſtory, a beautiful foſſile, ſo called from its being uſed as a gold coloured pigment. It is the *αρσενικον* and *αρρενικον* of the Greeks; the *harnat*, *zarnich*, or *zirnich* of the Arabians; and the *fumus rubeus*, *gummi paradiſi*, &c. of the alchemiſts. It is commonly ſuppoſed to be the ſame with the factitious yellow arſenic, and to be poſſeſſed of a poiſonous quality; but it is neither one nor the other. This error ſeems to have proceeded from Agricola's relation, copied by many writers, that white arſenic is prepared from orpiment and common ſalt ſublimed together. Hoffman made trial of ſuch a compoſition, but obtained from it no white arſenic.

Orpiment is a native foſſile, found chiefly in Turkey and Natolia. Some is met with alſo in Bohemia, Hungary, and Luſatia near Sorau, but inferior in goodneſs to that of Turky. The beſt ſort is of a lively gold-yellow and green colour, here and there intermixed with pieces of a vermilion red; of a ſhattery foliaceous texture, ſomewhat flexible, ſoft to the touch like talc, and ſparkling when broke. The inferior kinds are of a dead yellow, inclining more to greeniſh; and want the ſparkling appearance of the foregoing.

The principal uſe of orpiment is as a colouring drug, among the painters, book-binders, &c. Of itſelf it makes a gold-coloured pigment, as hath been already obſerved; with indigo or other blues, green: it is commonly tempered with yolk of eggs and a little ſaffron, or with fiſh galls. At Rouen it is uſed for ſtaining wood of the colour of box-wood. It is mixed alſo with wax, employed for heightening the colour of gold, for hardening lead in order to the making of ſhot, and for colouring glaſs.

ORPINE, *Anacampſeros*, or *Telephium*, in botany, is a ſpecies of ſedum, with terminatory cluſters of flowers.

ORRERY, a curious machine, or movement, for repreſenting the motions and appearances of the heavenly bodies. See plate XCVI. *fig.* 1.

The orrery, or planetarium, is fixed in a frame of ebony, contained by twelve vertical planes, on which are repreſented the twelve ſigns of the zodiac. The upper-ſurface is flat, of poliſhed braſs, on whoſe outward circumference are ſcrewed in twelve braſs pillars, which ſupport a large flat ſilvered ring marked 12, repreſenting the ecliptic, with ſeveral circles drawn upon it. The three inner-moſt are divided into twelve parts for the ſigns of the zodiac, each of which is divided into thirty degrees, and among theſe degrees are graved in their proper places, the nodes, aphelia, and greateſt north and ſouth latitudes of the planets. Between the next two circles are the cardinal points. The next three circles have the months and the days of the month, according to the new ſtile. Upon the braſs-ſurface of the machine are graduated ſilver-circles, which carry the planets, repreſented by ſilver-balls, upon arbors or ſtems, that raiſe them up to the height of the plane of the ecliptic; and turning about the handle or winch of the orrery, all the planets move at their proportional diſtances from a little gilt ball in the middle, which repreſents the ſun; and perform their revolutions according to their periodical times. There are fixed indices of blued ſteel, which ſhew the longitudes of the planets, by pointing to the diviſions of the ſilvered rings or circles, as they move round. But as theſe circles, being concentric, give only the mean diſtances, the true orbits, according to their excentricities, are graved on the outſide of each circle, with the periodical times taken from the tables, to ſhew what the revolutions are, nearer than can be performed by any machine. The nodes and aphelia, with the places of greateſt north and ſouth latitudes, are alſo marked on thoſe orbits. In the middle of this large circle, deſigned to repreſent the ecliptic, is fixed a globe, 1. to repreſent the ſun. Next the ſun is a ſmall ball, 2, to repreſent Mercury. Next to this is Venus, 3, repreſented by a larger ball. And, at a greater diſtance from the ſun, you ſee the earth, 4, repreſented by an ivory-ball, ſurrounded at ſome diſtance by a ring, which expreſſes the orbit of the moon, making an angle with the circle that repreſents the ecliptic, and thereby ſhewing the inclination they have to each other in the heavens, and alſo the line of the nodes. Within the ſame ring is another ivory-ball, 5, with a black cap or caſe, to repreſent the moon; the cap is contrived always to cover that hemiſphere which is turned from the ſun, and thereby diſtinguiſheth the enlightened part from the dark ſide, and, conſequently, her age. 6 repreſents Mars. 7 is Jupiter attended with his ſatellites, or four moons. And 8, the outmoſt of all the planets, is Saturn with his ring or belt, and five ſatellites, or moons. All theſe are fixed upon ſmall ſtems, which ſeverally repreſent their axes, each of which hath its peculiar and proper inclination to the plane of that circle which repreſents the ecliptic. 9 is a dial-plate; 10, 10, 10, meridians; 11, the equator; 12, the ecliptic with its circles, already deſcribed; 13, 13, two keys for locking and unlocking the diurnal and annual motions; and as to the arctic circle, tropic of Cancer, and moveable horizon, they are named in the figure.

By means of the orrery, a great many perſons, who have not time to apply themſelves to the ſtudy of aſtronomy, and yet are deſirous to be acquainted with the celeſtial appearances, in a few days may get a competent knowledge of ſeveral phænomena, and eſpecially, be cured of the common prejudices againſt the motion of the earth, and the Copernican ſyſtem. See the article COPERNICAN.

But the principal uſe of the orrery is to render the theory of the earth and the moon eaſy and intelligible; and to evidence to our ſenſes how all thoſe appearances happen, which depend on the annual or diurnal rotation

tion of the earth, and the monthly revolutions of the moon: as the variety of ſeaſons, the viciſſitudes and various lengths of days and nights, the manner of ſolar and lunar eclipſes, the various phaſes of the moon, &c. There have been various forms invented for this noble inſtrument, two of which have principally obtained, viz. the hemiſpherical orrery, and the whole ſphere: though the orrery at firſt was made without any ſphere, with only the ſun, the earth and moon revolving about it; but as this was too imperfect a ſtate, they ſoon began to inveſt it, ſome with half a ſphere, and others with a whole ſphere, to be an adequate repreſentation of the ſolar ſyſtem.

The hemiſpherical orrery, as that above deſcribed, has been made in greater numbers than any other, on account of their being made much cheaper and eaſier than thoſe in a ſphere of the ſame ſize; there being a vaſt difference between placing an hemiſphere on the box of an orrery, and diſpoſing an orrery in a large moveable ſphere. But the idea given us by the former, is very imperfect and unnatural in compariſon of the latter; and it is ſurpriſing to think how they ſhould have had ſo great a run. An orrery, therefore, adapted to an armillary ſphere, is the only machine that can exhibit a juſt idea of the true ſyſtem of the world, with the diurnal and annual motions of the heavenly bodies; for it is likewiſe capable of exhibiting the third motion of the earth, viz. that motion of the earth by which the poles of the world revolve about the poles of the ecliptic, and occaſions what is commonly called the preceſſions of the equinoxes, or more properly the retrogreſſion of the earth's nodes.

As the diſtances are in their true proportions to each other, ſo likewiſe are the bodies of the planets in their juſt proportions to one another. But it cannot be expected, that the diameters of the planets ſhould be in proportion to the diameters of the orbits; becauſe taking Jupiter under three inches diameter, and the earth a little more than a quarter of an inch, it would require the ſyſtem to be of the bigneſs of a mile and $\frac{3}{4}$, the orbit of Saturn 9000 feet in diameter; and ſo on of the reſt; which would make the machine 3000 times bigger than it is. And if the bodies were ſuited to the dimenſions given, the bodies muſt be 3000 times leſs, which would render them all inviſible, but the ſun; and that would be leſs than $\frac{1}{1000}$th part of an inch. For this reaſon, as a ball big enough to repreſent the ſun cannot be put on, we are to ſuppoſe the ſun, in reſpect of them, as big as the inner circle of the ſilver ring, which repreſents the ecliptic.

As the orbit of the moon, and the orbits of the ſatellites of Jupiter and Saturn, are quite loſt in this proportion of the orbits of the primary planets, much more are the ſatellites themſelves; therefore the ſatellites are uſually not put on in this poſition of the machine. But Saturn's ring is joined to Saturn's body, according to its proportion, and the inclination of its plane to the plane of Saturn's orbit: and as the planet is carried round, the ring always moves parallel to itſelf, as it does in the heavens. Thereby we ſee why the inhabitants of the earth, in one revolution of Saturn, ſee the ring twice in the moſt open ſituation of the anſæ, as at 8, and twice, as if it had no ring, that is, when the edge of the ring is towards the earth, the plane of the ring going through the obſerver's eye, and the ſucceſſive increaſing and decreaſing of the viſible bigneſs of the anſæ.

Jupiter, with his moons, is repreſented at 7, and the ſpots whereby his revolution has been obſerved.

When you have a compleat idea of the proportional bigneſs of the planets, Jupiter and Saturn are taken off, and others put on three times leſs than the former, in order to put ſatellites about them, and at the ſame time the moon is joined to the earth, to ſhew how the ſatellites accompany their primary planet in its courſe round the ſun. Theſe ſatellites, which are pearls upon crooked ſtems, do not turn by clock-work round their primaries, as has been done in ſome large orreries, but are only ſet by the hand; becauſe, to do it, would be only a needleſs expence, to give a falſe notion of their bigneſs, diſtances, and inclination of their orbits, in reſpect of their primaries. But to give a right notion of Jupiter and his ſatellites, and of Saturn and his ſatellites, there is ſhewn for each of theſe planets a ſyſtem apart, where the diſtances from the primary, and the bigneſs of the ſatellites, are expreſſed: and in this ſyſtem, though Jupiter is but of about an inch diameter, the outermoſt ſatellite is as far diſtant from Jupiter's center, as Saturn is from the ſun in the machine; which ſhews the inconſiſtency and diſproportion of making the ſatellites to move round Jupiter in an orrery. Saturn's ſatellites are ſtill more improperly put in; becauſe four of them move in orbits very much inclined to Saturn's ecliptic, viz. in an angle of above thirty degrees, and the fifth has its orbit almoſt in the ſame plane as Saturn's ecliptic, with a diameter greater than the diameter of the whole orrery, even when Saturn is three times leſs than the Saturn of the orrery.

The next thing which is put on, is a contrivance to ſhew, that all the confuſion of the planets motions in the Ptolemaic hypotheſis, called their ſtations and retrogradations, is not really, but apparently ſo, in the Copernican or true ſyſtem of the world. And this is done by two ſteel indices, one of which being always applied to the ſun, and ſucceſſively to the top of the ſtem of the planet to be examined, whilſt the other is applied to the earth, as a center, and the ſaid planet; by turning the handle of the machine, the heliocentric and geocentric places of the planet are ſeen on the ecliptic at the ſame time; ſhewing why the planets ſeem to go backwards and forwards when viewed from the earth; though they go all the while regularly from weſt to eaſt, as they would be ſeen from the ſun.

When the machine is put in motion, all theſe bodies move round that which repreſents the ſun, and, at the ſame time, both that, and all thoſe which repreſent ſuch of the planets as have been obſerved to have a rotation about their axis, turn round upon the ſaid ſtems, and in their proper times. The ſatellites, or moons, alſo revolve about their primaries at the ſame time; and the ring that repreſents the orbit of the moon has likewiſe its proper motion, whereby that of its nodes is alſo expreſſed. The whole machine is put into motion by turning a ſmall winch, 14, like the key of a clock, with very little ſtrength. And, above this winch, is a cylindrical pin, which may be drawn a little out, or puſhed in at pleaſure: when it is puſhed in, all the planets, both primary and ſecondary, will move according to their reſpective periods, by turning the handle or winch: when it is drawn out, the motions of the ſatellites of Jupiter and Saturn will be ſtopped, while all the reſt move freely. In the place of the ſun, you may fix a braſs lamp, with two convex glaſſes, made on purpoſe; which, being placed with the glaſs directly to the earth, and turning round in the ſame time with the earth, throws a continual ſtrong light upon it and the moon, in whatever part of its orbit it is; and ſo not only the times in which the eclipſes of the ſun and moon will happen, are ſhewn, but the phænomena themſelves are truly repreſented.

When you propoſe to uſe this machine, place a ſmall black patch, or a bit of wafer, upon the middle of the ſun, right againſt the firſt degree of ♈: you may alſo place patches upon Venus, Mars, and Jupiter, right againſt ſome noted point in the ecliptic; put on the handle, and puſh in the pin which is juſt above it. One turn of this handle anſwers to a revolution of the ball, which repreſents the earth, about its axis; and, conſequently, to 24 hours of time, as may be ſeen by the motion of the hour-index, 9, which is marked, and placed at the foot of the wire, on which the ball of the earth is fixed: again, when the index has moved the ſpace of ten hours, Jupiter makes one complete revolution round its axis; and ſo of the reſt.

By theſe means the revolutions of the planets, and their motions round their own axes, will be repreſented to the eye. And it is worth obſervation, that the diurnal motion of the planets are diſcovered, by obſerving the motions of the ſpots upon the ſurface of the ſun, and of the planets in the heavens, after the ſame manner as we here obſerve the motions of their repreſentatives, by that of the marks placed upon them in this machine.

This machine is ſo contrived, that the winch may be turned either way; ſo that the ſame number of revolu-

tions

tions being made backwards, they will bring all the planets to their former aſpects or ſituations in reſpect to each other.

It would be too great an undertaking here to give an account of the mechaniſm of the larger ſort of orreries, which repreſent the movements of all the heavenly bodies; nor, indeed, can it be done either by diagram or deſcription, to render it intelligible to the moſt diſcerning reader; but, inſtead of that, we ſhall exhibit an idea of the theory and ſtructure of an uſeful, conciſe, and portable planetarium, which any gentleman may have made for a ſmall expence, and will exhibit, very juſtly, the motions of all the primary planets about the ſun, by wheel-work; and thoſe that have ſecondaries, or moons, may have them placed about their primaries moveable by the hand, ſo that the whole ſhall be a juſt repreſentation of the ſolar ſyſtem, or true ſtate of the heavens, for any given time of the year.

In order to this we muſt compare, and find out the proportion, which the periodical times, or revolutions of the primary planets, bear to that of the earth; and they are ſuch as are expreſſed in the table below, where the firſt column is the time of the earth's period in days and decimal parts; the ſecond, that of the planets; the third and fourth are numbers in the ſame proportion to each other: as,

365,25 : 88	☿	:: 83 : 20, for Mercury.
365,25 : 224,7	♀	:: 52 : 32, for Venus.
365,25 : 686,9	♂	:: 40 : 75, for Mars.
365,25 : 4332,5	♃	:: 7 : 83, for Jupiter.
365,25 : 10759,3	♄	:: 5 : 148, for Saturn.

If we now ſuppoſe a ſpindle or arbor with ſix wheels fixed upon it in an horizontal poſition, having the number of teeth in each, correſponding to the numbers in the third column, viz. the wheel A M (*fig.* 2.) of 83 teeth, B L of 52, C K of 50, for the earth, D I of 40, E H of 7, and F G of 5; and another ſet of wheels moving freely about an arbor, having the number of teeth in the fourth column, viz. A N of 20, B O of 32, C P of 50, for the earth, D Q of 75, E R of 83, and F S of 148; then, if thoſe two arbors of fixed and moveable wheels are made of the ſize, and fixed at the diſtance from each other, as here repreſented in the ſcheme, the teeth of the former will take thoſe of the latter, and turn them very freely, when the machine is in motion.

Theſe arbors, with their wheels, are to be placed in a box, of an adequate ſize, in a perpendicular poſition: the arbor of fixed wheels to move in pivots at the top and bottom of the box; and the arbor of moveable wheels to go through the top of the box, to a proper height, on the top of which is to be placed a round ball, gilt with gold, to repreſent the ſun. On each of the moveable wheels is to be fixed a ſocket, or tube, aſcending above the top of the box, and having on the top a wire fixed, and bent at a proper diſtance into a right angle upwards, bearing on the top a ſmall round ball, repreſenting its proper planets.

If then on the lower part of the arbor of fixed wheels be placed a pinion of ſcrew-teeth, a winch turning a ſpindle with an endleſs ſcrew, playing in the teeth of the arbor, will turn it with all its wheels; and theſe wheels will move the others about with their planets, in their proper and reſpective periods of time, very exactly. For while the fixed wheel C K moves its equal C P once round, the wheel A M will move A N a little more than four times round, and ſo will nicely exhibit the motion of Mercury; and the wheel F G will turn the wheel F S about $\frac{1}{2}\frac{1}{0}\frac{1}{3}$ round, and ſo will truly repreſent the motion of Saturn: and the ſame is to be obſerved of all the reſt.

ORRICE, the common name of the iris-root. See the article IRIS.

ORTEIL, in fortification, the ſame with berme. See BERME.

ORTHODOX, in church hiſtory, an appellation given to thoſe who are ſound in all the articles of Chriſtian faith.

ORTHOGONIAL, in geometry, the ſame with rectangular.

ORTHOGRAPHIC *Projection of the Sphere*, that wherein the eye is ſuppoſed at an infinite diſtance; ſo called, becauſe the perpendiculars from any point of the ſphere will all fall in the common interſection of the ſphere with the plane of the projection. See the article PROJECTION.

ORTHOGRAPHY, that part of grammar which teaches the nature and affections of letters, and the juſt method of ſpelling or writing words with all the proper and neceſſary letters, making one of the four greateſt diviſions or branches of grammar.

ORTHOGRAPHY, in geometry, the art of drawing or delineating the front plan of any object, and of expreſſing the heights or elevations of each part. It is called orthography, from its determining things by perpendicular lines falling on the geometrical plane.

ORTHOGRAPHY, in architecture, the elevation of a building. This orthography is either external or internal. The external orthography is taken for the delineation of an external face or front of a building; or, as it is by others defined, the model, platform, and delineation of the front of a houſe, that is contrived, and to be built, by the rules of geometry, according to which pattern the whole fabric is erected and finiſhed. This delineation or platform exhibits the principal wall, with its apertures, roof, ornaments, and every thing viſible to an eye placed before the building.

Internal orthography, which is alſo called a ſection, is a delineation, or draught of a building, ſuch as it would appear, were the external wall removed. To lay down the orthography of a building, draw a right line for a baſe or ground line A B (pl. XCVI. *fig.* 3.) and at one end erect a perpendicular A D upon A B; ſet off the width and diſtances of the gates or doors, windows, &c. On the right line A D, ſet off the heights of the ſeveral parts viſible in the face of the building, *v. g.* of the doors, windows, the roofs, chimnies, &c. and apply a ruler to each point of diviſion.

The common interſections of the right lines, drawn from three points, parallel to the lines A B and A D, determine the external orthography of the building; and after the ſame manner is the internal orthography to be laid down.

ORTHOGRAPHY, in perſpective, is the front or fore view of any plane; that is, the ſide or plane that lies parallel to a ſtraight line, which may be imagined to paſs through the outward convex point of the eye, continued to a convenient length.

ORTHOGRAPHY, in fortification, is the profile or repreſentation of a work; or a draught ſo conducted, as that the length, breadth, height, and thickneſs of the ſeveral parts are expreſſed, ſuch as they would appear if perpendicularly cut from top to bottom.

ORTHOPNOEA, in medicine, a ſpecies or degree of aſthma, where there is ſuch a difficulty of reſpiration, that the patient is obliged to ſit or ſtand upright, to be able to breathe. See ASTHMA.

ORTIVE, in aſtronomy, the ſame with eaſtern: the ortive or eaſtern amplitude, is an arch of the horizon intercepted between where a ſtar riſes, and the eaſt point of the horizon, or point where the horizon and equator interſect.

ORVIETANUM, in pharmacy, the name of a celebrated antidote, ſo called, according to Lemery, from Orvieto, a city of Italy, where it was firſt uſed; but, according to others, from Hieronymus Ferrantes Orvietanus, a famous mountebank, who invented it.

The method of preparing this medicine may be ſeen in Lemery's Pharmacopoeia.

ORYZA, rice, in botany, a genus of plants, the corolla of which is formed of two obtuſe, large, nearly equal, and permanent valves: the nectarium is compoſed of two leaves, plane, very ſmall, and ſituated on the ſides of the germen; the leaves of it are narrow at the baſe, truncated, and deciduous; there is no pericarpium; the corolla grows to the ſeed, and becomes of an oblong oval figure, compreſſed, thin at the edges, and marked each way with two lines on the ſides; the ſeed is ſingle, large, obtuſe, oblong, and compreſſed.

This plant is cultivated in vaſt abundance in the Eaſt,

as alſo in Carolina, for food. It is ſaid to be good in dyſenteries, diarrhœas, &c.

OSCHEOCELE, in ſurgery, a hernia of the ſcrotum. See HERNIA.

Of this rupture, ſometimes called hernia ſcrotalis, there are two kinds; a true one, proceeding from a prolapſion of the inteſtine, or omentum; and a ſpurious one, or only apparent, ariſing from a tumour of the teſticles, or ſpermatic veſſels, or a diſtention with air, water, or ſome offending humour: the oſcheocele is therefore diſtinguiſhed into various kinds, according to the different ſubſtances with which the ſcrotum is diſtended, by which it is alſo differently denominated: when the inteſtine is prolapſed through the proceſs of the peritonæum into the ſcrotum, the tumour is then called enterocele; if from the omentum, epiplocele: if from a diſtention with water, hydrocele; if from wind or flatus, pneumatocele; when from blood, hæmatocele; if the teſticle is enlarged beyond its proper dimenſions, it is termed ſarcocele; and when the ſpermatic veins are too much diſtended, it is termed varicocele, cirſocele, or hernia varicoſa; and when an abſceſs is formed in the ſcrotum, it is by ſome termed hernia humoralis; ſometimes two or more of theſe ſubſtances concur together to form the tumour, which is then named conjunctly from them entero-epiplocele, hydro-enterocele, &c. Each of theſe may be ſeen ſeparately treated of, under their ſeveral heads. See ENTEROCELE, EPIPLOCELE, &c.

OSCILLA, in antiquity, ſmall images of wax or clay, which were made in the ſhape of men and women, and conſecrated to Saturn, in order to render him propitious.

OSCILLATION, in mechanics, vibration, or the reciprocal aſcent or deſcent of a pendulum.

The word is Latin, *oſcillatio*, and derived from *oſcillo*, to vibrate, or ſwing to and fro.

1. If a ſingle pendulum be ſuſpended between two ſemi-cycloids B C, C D (plate XCVI. *fig.* 4.) that have the diameter C F of the generating circle equal to half the length of the ſtring, which, as it oſcillates, folds about them; all the oſcillations, however unequal, will be iſochronal in a non-reſiſting medium.

2. The time of a whole oſcillation through any arch of a cycloid, is to the time of the perpendicular deſcent through the diameter of the generating circle, as the periphery of the circle to the diameter.

3. If two pendulums deſcribe ſimilar arches of circles, the times of the oſcillations are in the ſubduplicate ratio of their lengths.

4. The number of iſochronal oſcillations, made in the ſame time by two pendulums, are reciprocally as the times wherein each of the oſcillations are made. The times of the oſcillations, in different cycloids, are in the ſubduplicate ratio of the length of the pendulums.

5. The length of a pendulum that will perform its oſcillations in a ſecond, is 3.125 inches, or three feet 3.125.

6. The ſhorter the oſcillations in the arch of a circle are, the truer will the pendulum meaſure time, or the more iſochronal will the oſcillations be. See the article PENDULUM.

Center of OSCILLATION, in a ſuſpended body, is a certain point therein, each vibration whereof is performed in the ſame manner, as if that point or part alone were ſuſpended at that diſtance from the point of ſuſpenſion. Or it is a point, wherein, if the whole length of a compound pendulum be collected, the ſeveral oſcillations will be performed in the ſame time as before. Its diſtance, therefore, from the point of ſuſpenſion, is equal to the length of a ſingle pendulum whoſe oſcillations are iſochronal with thoſe of the compound one.

In order to determine the place of the center of oſcillation in a compound pendulum, let the bodies C, A, and B, be ſuppoſed fixed to the axis at their reſpective diſtances CI, AK, and BL (p. XCVII. *fig.* 1.) and to gravitate in parallel lines CD, A*a*, and B*b*; let theſe lines be equal to each other, and repreſent the accelerating force of gravity; let C*g*, A*f*, and B*h*, repreſent the forces by which their motions are actually accelerated with their reſpective directions perpendicular to IC, K A, and L B, while the figure moves upon its axis KL. Let DQ, *am*, and *bk*, be perpendicular to thoſe directions in Q, *m*, and *k*, and *gd*, *fn*, *hr*, be perpendicular to CD, A*a*, and B*b*, in *d*, *n*, and *r*. If CQ be greater than C*g*, but A*a* leſs than A*n*, and B*b* leſs than B*r*, then the body C loſes by its action on the lever IC a force C×*g*Q, and thereby the bodies A and B acquire the forces A×*mf* and B×*kb* reſpectively. Hence regard being had to the lengths of the ſeveral levers CI, K A, and B L, according to the known principles of mechanics, C×*g*Q×IC will be equal to A×*mf*×KA+B×*kb*×LB, or (becauſe the velocities C*g*, A*f*, and B*h*, are as the diſtances from the axis IC, AK, and BL) C×C*g*×*g*Q=A×A*f*×*mf*+B×B*b*×*kb*, that is, C×CQ×C*g*−C×C*g*^{2}=A×$\overline{Af}$^{2}−A×A*f*×A*m*+B×$\overline{Bb}$^{2}−B×B*b*×B*k*. But CQ×C*g* is equal to CD×C*d*, A*f*×A*m* to A*a*×A*n*, and B*b*×B*k* to B*b*×B*r*. Therefore C×C*g*^{2}+A×$\overline{Af}$^{2}+B×$\overline{Bb}$^{2} is equal to C×CD×C*d*+A×CD×A*n*+B×CD×B*r*; from which it follows, that when all the bodies deſcend while the axis moves, the ſum of the products of the bodies multiplied by the ſquares of the reſpective velocities acquired by them at any time, is the ſame as if they had fallen freely along the perpendicular altitudes from which they have deſcended. But if any body as B (for example) had been on the other ſide of the axis KL, ſo as to have aſcended while the common center of gravity of the bodies deſcended, *bk* had been equal to B*k*+B*b*. In this caſe the term B×CD×B*r* muſt be ſubducted in the latter part of the laſt equation; and in general the ſum of the products of the bodies multiplied by the ſquares of their reſpective velocities, is equal to the difference of the ſum of the products of thoſe that deſcend, multiplied by the ſquares of the velocities that would have been acquired by the ſame deſcents if they had fallen freely, and of the ſum of the products of thoſe that aſcend, multiplied by the ſquares of the reſpective velocities that would be acquired by falling freely along the reſpective altitudes to which they have ariſen. In either caſe it follows, that if the bodies be ſuppoſed to aſcend from their reſpective places at any time, and to be retarded by their gravity only, their common center of gravity will always aſcend to the ſame level from which it deſcended.

Suppoſe therefore OV (*fig.* 2.) to be equal to the length of a ſimple pendulum, that in a vacuum performs its vibrations in ſimilar arcs, in the ſame time with the compound pendulum above deſcribed; or let OV be the diſtance of a point in this latter pendulum that moves in it, with the ſame velocity as if OV was a ſimple pendulum ſuſpended at O. Let S repreſent the ſum of the bodies C, A, and B, and OG be the diſtance of their center of gravity from the axis. While the pendulum moves, let the points C, B, A, G, and V, deſcend to *c*, *b*, *a*, *g*, and *v*, reſpectively; let GM be the perpendicular deſcent of the center of gravity, and VR the perpendicular deſcent of the point V; then becauſe the velocities of the points C, B, A, G, and V, are as their diſtances from the axis of oſcillation, and the velocity acquired at *v* is ſuch as would cauſe a body to aſcend from R to V (by the ſuppoſition) and the altitudes to which bodies would aſcend by the velocities acquired at *c*, *b*, *a*, and *v*, are in the duplicate ratio of theſe velocities, it follows that C, B, and A, would aſcend by their reſpective velocities, at thoſe points to the altitudes $VR\times\frac{IC^2}{OV^2}$, $VR\times\frac{LB^2}{OV^2}$, and $VR\times\frac{KA^2}{OV^2}$. And ſince their common center of gravity would aſcend to the ſame altitude from which it deſcended, as has been ſhewn above, it follows that $C\times VR\times\frac{IC^2}{OV^2}+B\times VR\times\frac{LB^2}{OV^2}+A\times VR\times\frac{KA^2}{OV^2}$ is equal to S×GM. But the arcs deſcribed by G and V being ſimilar, GM is to VR as OG to OV; conſequently S×OG×OV is equal to C×IC^2+R×LB^2+A×AK^2; and OV is found by multiplying each body by the ſquare of its diſtance from the axis of oſcillation, and dividing the ſum of the products by S×OG, which is the product of the ſum of the bodies multiplied by the diſtance of their common center of gravity from the ſame axis. The

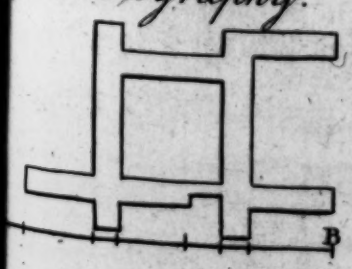

Fig. 5. Osculum.

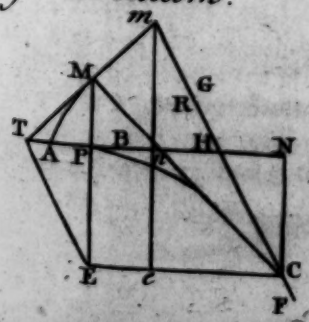

Fig. 2. Orrery.

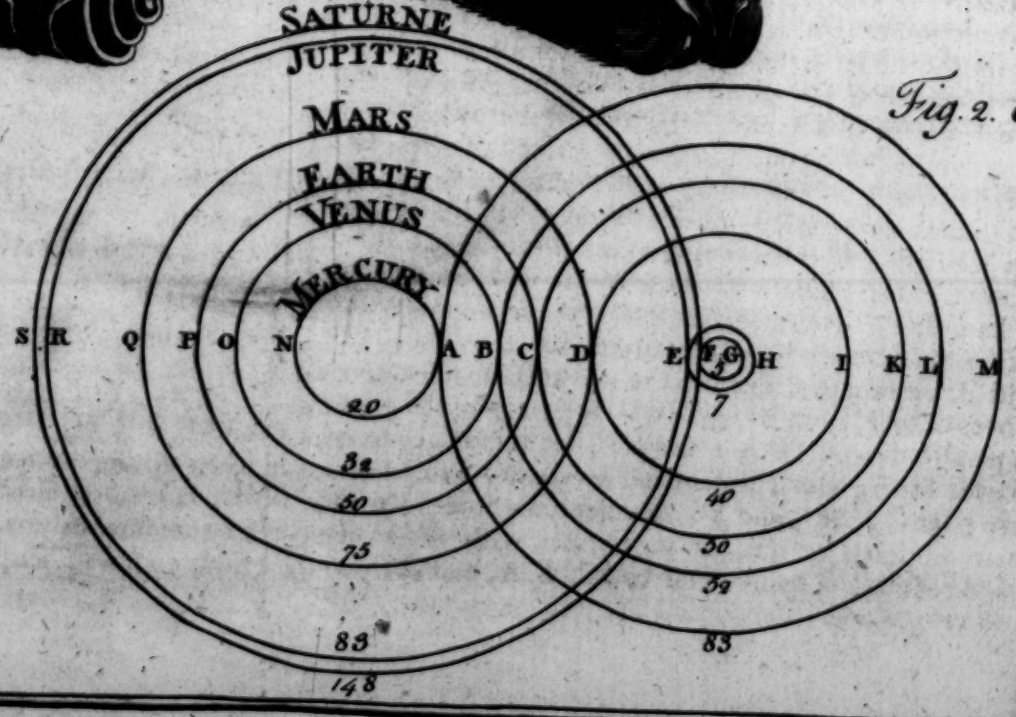

5 JA 59

ſame demonſtration being applicable to any number of bodies, we may conclude, that when any body moves about a given axis, the diſtance of its center of oſcillation from this axis (or the length of a ſimple pendulum that vibrates in a void in the ſame time with the body in ſimilar arks) is found by computing the fluent when each particle or element of the body is ſuppoſed to be multiplied by the ſquare of its diſtance from the axis, and dividing this fluent by the product of the body multiplied by the diſtance of its center of gravity from the ſame axis.

If the points C, A, and B, *(fig.* 3.) be in one plane that is perpendicular to the axis of oſcillation in O, let C*c*, B*l*, and A*k* be perpendicular to OG in *i*, *l*, and *k*; then OC^2 being equal to OG^2+CG^2-2OGi. OB^2 to OG^2+BG^2+2OGl, and OA^2 to OG^2+2AG^2+2OGk (Elem. 12 and 13.2) the point *i* being betwixt O and G, and the points *l* and *k* on the other ſide of G; and $C\times iG$, being equal to $B\times lG+A\times kG$, it follows, that the ſum of the products of the bodies multiplied by the ſquares of their diſtances from O, or $S\times OG\times OV$, is equal to $S\times OG^2+C\times CG^2+B\times BG^2+A\times AG^2$; conſequently $S\times OG+GV$ is equal to the ſum of the products, when each body is multiplied by the ſquare of its diſtance from the center of gravity; and GV, the diſtance of the center of oſcillation from the center of gravity, is found by dividing this ſum by $S\times OG$; whence the computation of the diſtance of the center of oſcillation from the axis in ſolids is in ſome caſes abridged.

To give an example, let D E *d* *(fig.* 4.) be the ſection of a ſphere through its center G by a plane perpendicular to the axis of oſcillation, D*d* the diameter of this circle perpendicular to the axis, G E the radius perpendicular to D*d*, and P F *p* any concentric circle; let MP, an ordinate perpendicular to D*d* at P, meet D E *d* in M, MN be perpendicular to GE in N, and the ratio of *n* to 1 expreſs that of the circumference of a circle to its radius. Let a cylindric ſurface be imagined to ſtand on the circumference P F *p* perpendicular to the plane D E *d*, and terminated by the ſurface of the ſphere, and its altitude being 2PM, it may be expreſſed by $2n\times GP\times GN$, which being multiplied by the ſquare of GP (which is the diſtance of the particles in each ſection of this ſurface, perpendicular to the axis of oſcillation from the center of gravity of the ſection), and the product $2n\times GN\times GP^3$, being multiplied by the fluxion of GP, or (becauſe GP^2 is equal to GD^2-GN^2, and the fluxion of GP is to the fluxion of GN, as GN to GP) the product of $2n\times GN^2$, and GE^2-GN^2, being multiplied by the fluxion of PM, and the fluent found will give $2n\times GN^3$ into $\frac{1}{3}GE^2-\frac{1}{5}GN^2$. But this fluent becomes equal to $\frac{4}{15}\times n\times GE^5$, when P has deſcribed the whole radius DG, and GN becomes equal to GE; and this being divided by $\frac{2}{3}n\times GE^3\times OG$ (which expreſſes the ſolid content of the ſphere multiplied by OG) gives GV the diſtance of the center of oſcillation from the center of gravity in the ſphere equal to $\frac{2}{5}\times\frac{GE^2}{OG}$ or two fifths of a third proportional to OG and GE.

The general method of determining the center of oſcillation in any plane figure, as F*f*m M, *(fig.* 5.) is thus. Let G be the center of gravity, and O the center of oſcillation of the propoſed figure when it revolves about the axis F*f*, OGA perpendicular to F*f* in A, and to M*m* in P, $AP=x$, $Mm=y$, $GA=z$, $OA=u$; then $z=\frac{\text{Flu. } yx\dot{x}}{\text{Flu. } y\dot{x}}$ and $u=\frac{\text{Flu. } yx^2\dot{x}}{\text{Flu. } yx\dot{x}}$. Suppoſe $\frac{1}{2}y=x^m$, then $z=\frac{\text{Flu. } x^{m+1}\dot{x}}{\text{Flu. } x^m\dot{x}}=\frac{m+1}{m+2}\times x$, or $GA:PA::m+1:m+2$; and $u=\frac{\text{Flu. } x^{m+2}\dot{x}}{\text{Flu. } x^{m+1}\dot{x}}=\frac{m+2}{m+3}\times x$, or $OA:PA::m+2:m+3$.

The center of oſcillation of a ſphere was juſt now determined from the fluent of $2ny^2\dot{y}\times\overline{aa-yy}$ (ſuppoſing in the laſt *fig.* but one) the radius $GE=a$, $GN=PM=y$, $OG=z$, and *n* to 1, as the circumference of the circle to its radius) which is $2ny^3\times\overline{\frac{aa}{3}-\frac{yy}{5}}$; and this fluent becomes equal to $\frac{4na^5}{15}$, when $PM=GE$, or $y=a$, which being divided by $\frac{2n}{3}\times a^3\times z$ (the ſolid content of the ſphere multiplied by the diſtance of its center of gravity from the axis of oſcillation) gives $\frac{2}{5}\times\frac{aa}{z}=u$. The center of percuſſion is in a right line perpendicular to AO at the point O.

OSSICLE, *Officulum*, a little bone, a diminutive of bone, in which ſenſe it is frequently uſed by anatomiſts.

Botaniſts alſo uſe officulum for the ſtone of a plumb.

OSSIFICATION, the formation of bones, but more particularly the converſion of parts naturally ſoft, to the hardneſs and conſiſtence of bones.

OSTEOCOLLA, in natural hiſtory, though ſuppoſed by many to be an earth, is truly a cruſtated kind of ſpar, debaſed by earth, and therefore not tranſparent. See the article SPAR.

It is uſually found coating over vegetable, or other bodies, in form of incruſtations; ſo that the true oſteocolla is a tubular cruſtaceous ſpar, of a very foul and coarſe texture, and carries with it much more of the appearance of a marl, than of a ſpecies of ſpar.

The maſſes of oſteocolla, though regularly of the ſame figure, are very different in ſize; ſome of them being not thicker than a crow-quill, and others of five and ſix inches diameter: it is always, however, of a tubular figure, and wrinkled and rough ſurface.

Oſteocolla is frequent in Germany, where it is found buried near the ſurface of the earth, ſometimes in ſtrata of ſand, but more frequently among marls: it ſhould be choſen for uſe, the pureſt that can be had, of a pale brown colour, and of a tolerably cloſe and firm texture.

It has long been famous for bringing on a callus in fractured bones; its name oſteocolla ſignifing the bone-glue, or bone-binder. It is alſo recommended as a diuretic, and as good in the fluor albus; but, at preſent, little regard is paid to it; ſince, if it has any virtues, they muſt be wholly owing to ſpar, which may be given to greater advantage in a purer form.

OSTEOCOPOS, in medicine, any pain in the bones, whether ariſing from wearineſs, a ſharp ſcorbutic humour, or a venereal taint.

OSTEOLOGY, that branch of anatomy which treats of the bones. See BONE.

The objects of eſteology are the bones, whether they be recent or dried, whether they have belonged to an infant or an adult; and with the bones are to be conſidered their perioſteum, medulla or marrow, the ligaments, and the cartilages.

The ſtudy of the bones is to be conſidered in two lights, as theoretical, or as practical. In the firſt ſenſe, oſteology only extends to the external conformation and uſe of the bones; whereas, in the latter or practical ſenſe, it comprehends the more intimate knowledge of their interior ſtructure and connections. 1. If their internal parts are the ſubjects of enquiry, they are to be cut or broken. 2. If the articulations are to be examined, the ligaments and cartilages, as wellas the articulations themſelves, muſt be diſſected and carefully obſerved. 3. If the making a ſkeleton be the intent, then their preparation and preſervation come into this branch. See the articles BONE, ARTICULATION, LIGAMENT, SKELETON, &c.

OSTIA, in anatomy, an apellation given to the orifices or apertures of the veſſels of the body.

OSTRACISM, ὀστρακισμὸς, in Grecian antiquity, denotes the baniſhment of ſuch perſons whoſe merit and influence gave umbrage to the people of Athens, leſt they ſhould attempt any thing againſt the public liberty. It was ſo called, becauſe the people voted a perſon's baniſhment, by writing his name on ſhells, called in Greek ὄστρακον, and caſting them into an urn.

OSTRACITES, in natural hiſtory, the name by which authors call the foſſile oyſter-ſhells. See the article OYSTER.

Oſtracites has the ſame medicinal virtues with the belemnites, and lapis-judaicus, only in a higher degree;

being accounted, by Dr. Liſter, one of the greateſt known medicines in nephritic caſes: the doſe, in powder, is from half a dram to a dram, in white wine; and to prevent a ſickneſs at the ſtomach, that ſometimes attends the taking it, one third part of the quantity of powdered calomile flowers may be mixed with it.

OSTRICH, *Struthio*, in ornithology, a diſtinct genus of birds, having only two toes to each foot, and theſe are both placed foreward; and its head is ſimple, or not ornamented with the appendages which are common to moſt birds of this order.

The oſtrich is the talleſt of all the bird kind, meaſuring ſeven or eight feet when it ſtands erect: its legs are very long and naked; and the ſtructure of the foot, having only two toes, is particular.

OSYRIS, poets roſemary, in botany, a genus of plants, without any flower-petals: the fruit is a globoſe unilocular berry, containing a ſingle oſſeous ſeed.

This whole ſhrub is aſtringent, and conſequently good in fluxes.

Oſyris is alſo a name ſometimes uſed for the linaria, or toad-flax.

OTHONNA, baſtard jacobæa, in botany, a genus of plants, the compound flower of which is radiated, with a great number of tubuloſe and quinquedentated hermaphrodite ones on the diſc: the ſtamina are five very ſhort capillary filaments; and the ſeed, which is ſingle after each flower, is contained in the cup, and is either naked or crowned with down.

OTIS, the buſtard, in ornithology, makes a diſtinct genus of birds, the characters of which are theſe: there are three toes on each foot, all turned forewards; and the head is naked, or has no comb.

The buſtard has been confounded with the turkey: it is about the ſize of the common peacock, and runs at a prodigious rate, being frequently taken with greyhounds in a fair courſe, in the manner of hunting the hare: its fleſh is well taſted.

OTTER, *Lutra*, in zoology, a genus of quadrupeds, the characters of which are theſe: the fore-teeth in the upper jaw are ſtraight, diſtinct, and acute; thoſe of the under jaw are obtuſe, and ſtand cloſe together: the ears are ſituated lower than the eyes, and the feet are furniſhed each with five toes, and are palmated or formed for ſwimming.

Of this genus there are two ſpecies: 1. The common otter, with all the toes of an equal length: this is a very fierce animal, three feet in length, including the tail. 2. The Braſilian otter, with the inner toe ſhorter than the reſt. This is ſomewhat larger than the former ſpecies.

OVAL, an oblong curvilinear figure, with two unequal diameters, interſecting each other at right angles in the center; or a figure bounded by a ſingle curve line, imperfectly round its length, being greater than its breadth, like an egg; whence its name.

The proper oval, or egg-ſhape, is an irregular figure, being narrower at one end than the other; in which it differs from the ellipſis, which is the mathematical oval, and equal in breadth at each end.

Theſe two are confounded together by the common people, and even geometricians call the oval a falſe ellipſis.

The method commonly uſed by workmen, in deſcribing an oval, is by a cord or ſtring, as *f h m* (plate XCIV. *fig.* 11.) whoſe length is equal to the greater diameter of the oval, and which is faſtened by its extremes to two points or nails, *f*, *h*, planted in its longeſt diameter, by which means the oval is made as much longer as the two points or nails are farther apart.

OVARY, *Ovarium*, in anatomy, that part of a female animal wherein the ova or eggs are formed and lodged. See GENERATION.

OVATION, in the Roman antiquity, a leſſer triumph, allowed to commanders for victories won without the effuſion of much blood; or, for defeating a mean and inconſiderable enemy. The ſhow generally began at the Albanian mountain, whence the general, with his retinue, made his entry into the city on foot, with many flutes or pipes ſounding in concert as he paſſed along, and wearing a garland of myrtle as a token of peace. The term ovation, according to Servius, is derived from *ovis*, ſheep, becauſe on this occaſion the conqueror ſacrificed a ſheep, as in a triumph he ſacrificed a bull.

OVEN, a kind of domeſtic furnace, uſed for baking bread, pies, tarts, &c. of a circular ſtructure, with a very low roof, well lined, both on the top, bottom, and ſides, with ſtone; it has a ſmall entrance in the front, which is exactly fitted by a kind of door, which being clapped to the mouth of the oven confines the heat, while bread, pies, or puddings, are baking. Over this paſtry-cooks, &c. have another oven built much in the ſame manner, which is uſed for ſuch things as require a leſs degree of heat. Ovens are heated by burning dry wood, faggots, &c. in them, till all the parts are equally hot.

Aſſaying-OVEN, in metallurgy, a particular kind of furnace, uſed by aſſayers in their operations upon metals. See the article ASSAY *Oven*.

OVER, in general, ſignifies one thing being above another; through, or from, one end to another; beyond, croſs, or overthwart: it alſo denotes exceſs, &c.

OVER-FLOWING *of Lands*, in huſbandry. See the article LAND.

OVER-REACH, in the manege, is when a horſe ſtrikes his hind-feet againſt his fore. The word is alſo uſed for a ſtrain, or painful ſwelling of the maſter-ſinew of an horſe, occaſioned by ſuch over-reach.

OVER-RULING *an Objection*, in law, is the rejecting or ſetting it aſide by the court.

OVERSEERS *of the Poor*, are public officers appointed by ſtatute in every pariſh, to provide for the poor therein; and ſometimes they are two, three, or four, according to the largeneſs of pariſhes.

OVERT, the ſame with open: thus an overt-act ſignifies an act which, in law, muſt be clearly proved; and ſuch is to be alledged in every indictment for high treaſon.

OVERTURE, or OUVERTURE, opening or preluding; a term uſed for the ſolemnities at the beginning of a public act or ceremony; an opera, tragedy, concert of muſic, &c.

The overture of the theatre, or ſcene, is a piece of muſic uſually ending with a fugue; the overture of a jubilee is a general proceſſion, &c.

OVILIA, or SEPTA, in ancient Rome, a place in the *campus martius*, at firſt railed in like a ſheep-pen; whence its name. Afterwards it was mounted with marble, and beautified with walks and galleries, as alſo with a tribunal, or ſeat of juſtice. Within this precinct, or encloſure, the people were called in to give their ſuffrages for the election of magiſtrates. The aſcent into the ovilia was not by ſtairs, but by pontes, or narrow boards, laid there for the occaſion; on which account *de ponte dejici* was to be denied the privilege of voting; and perſons thus dealt with were called depontani.

OVIPAROUS, a term applied to ſuch animals as bring forth their young, *ab ovo*, from eggs; as birds, inſects, &c. See EGG.

The oviparous kind ſtand in oppoſition to thoſe which bring forth their young alive, called viviparous animals, as man, quadrupeds, &c. Oviparous animals may be ſaid to be ſuch as conceive eggs which they afterwards bring forth, and from which, by the incubation of the parent, or ſome other principle of warmth and fermentation, at length ariſe animals; which, after they have ſpent the moiſture or humour they have been ſurrounded withal, and are grown to a ſufficient bulk, firmneſs and ſtrength, break their ſhell and come forth. The oviparous kind, beſides birds, include divers other ſpecies of terreſtrial animals.

OVIS, the SHEEP, in zoology. See SHEEP.

OUNCE, *Uncia*, a little weight, the ſixteenth part of a pound-avoirdupois, and the twelfth part of a pound-troy: the ounce-avoirdupois is divided into eight drams, and the ounce-troy into twenty penny-weights. See WEIGHT.

OUNCE, *Lynx*, in zoology. See the article LYNX.

OUNDLE, a market-town of Northamptonſhire, ſituated on the river Nen, twenty-two miles north-eaſt of Northampton.

OVOLO, or OVUM, in architecture, a round moulding,

ing, whoſe profile, or ſweep, in the Ionic and Compoſite capitals, is uſually a quadrant of a circle: whence it is alſo commonly called the quarter round. It was uſually enriched with ſculpture by the ancients, in the form of cheſnut-ſhells; whence Vitruvius, and others, called it echinus, i. e. cheſnut-ſhell. See the article MOULDING.

OURAN, the name of an imaginary ſect of magicians, in the iſland of Gromboccanore, in the Eaſt-Indies; where they are ſuppoſed to have the art of rendering themſelves inviſible, and paſſing where they pleaſe, and by theſe means doing infinite miſchief.

OUROLOGY, in medicine, a name given by authors to a treatiſe or diſcourſe on the ſubject of urine. See URINE.

OUSTER LE MER, in law ſignifies a cauſe of excuſe given to the court on a defendant's not appearing upon ſummons, by alleging that he was then beyond the ſeas.

OUT-HOUSES are ſuch as belong and are adjoining to dwelling-houſes.

OUT-LAW ſignifies one that is deprived of the benefit of the law, and therefore held to be out of the king's protection.

OUT-LAWRY is where a perſon is out-lawed, and on that account loſes the benefit of a ſubject.

OUTWARD *Flanking Angle*, or *The Angle of the Tenaille*, in fortification, is comprehended by the two flanking lines of defence. See the article TENAILLE.

OUTWORKS, in fortification, all thoſe works made without-ſide the ditch of a fortified place, to cover and defend it.

Outworks, called alſo advanced and detached works, are thoſe which not only ſerve to cover the body of the place, but alſo to keep the enemy at a diſtance, and prevent his taking advantage of the cavities and elevations uſually found in the places about the counterſcarp, which might ſerve them either as lodgments, or as rideaux, to facilitate the carrying on the trenches, and planting their batteries againſt the place: ſuch are ravelines, tenailles, hornworks, queve d'arondes, envelopes, crown-works, &c. See the articles RAVELINE, TENAILE, &c.

It is a general rule in all outworks, that if there be ſeveral of them, one before another, to cover one and the ſame tenaille of a place, the nearer ones muſt gradually, one after another, command thoſe that are farther advanced out into the champaign, that is, muſt have higher ramparts, that ſo they may overlook and fire upon the beſiegers, when they are maſters of the more outward works.

OVUM PHILOSOPHICUM, or CHYMICUM, a glaſs-body, of an oval form, reſembling an egg, uſed for the ſublimation of mercury.

OWELTY, or OVELTY *of Services*, in our law-books, denotes an equality of ſervices; as in the caſe of a lord-meſne, and a tenant who holds the meſne, as he holds of the ſuperior lord.

OWLER, any perſon who conveys wool, &c. to the ſea-ſide in the night-time, there to be ſhipped, contrary to law.

OWSE, among tanners, oaken bark beaten or ground ſmall, to ſerve in the preparation of leather.

OX, *Bos*, in zoology makes a genus of quadrupeds.

Oxen, like other domeſtic animals, vary in colour, though the dun ſeems the moſt common; and the redder it is, the more it is eſteemed. A black coat is alſo valued; and bay oxen are ſaid to be vigorous and long lived; whereas the brown ſoon decay. The grey, the dappled, and the white, are proper only for the ſlaughter; no care can render them fit for labour; but whatever be the colour of an ox's coat, it ſhould be gloſſy, thick, and ſmooth to the touch; for if it be harſh, rough, or thin, there is reaſon to ſuppoſe that the animal is out of order, or at leaſt not of a ſtrong conſtitution. A good ox for the plough muſt be neither too fat nor too lean; the head ſhort and thick; the ears large and ſhaggy; the horns ſtrong, gloſſy, and of a middling ſize; the forehead wide, the eyes full and black; his muzzle large and flat; the noſtrils wide and open; the teeth white and even; the lips black; a fleſhy neck, large and heavy ſhoulders; the breaſt broad; the dew-lap hanging down to the knees; the reins very broad; a ſpacious deſcending belly; the flanks firm; the haunches large, and the rump thick; large and nervous thighs and legs; the back ſtraight and full; the tail reaching to the ground, and well covered with thick and fine hair; the feet firm; the hide thick and pliable; the muſcles raiſed; the hoof ſhort and broad: he muſt alſo anſwer to the goad, be obedient to the voice, and well trained; but it is only gradually, and by beginning early, that the ox can be brought willingly to bear the yoke, and be eaſily governed. At the age of two years and a half, or three at the lateſt, you muſt begin to tame him, and bring him under ſubjection; if delayed longer, he becomes froward, and often ungovernable. The only method of ſucceeding is, by patience, mildneſs, and even careſſes; for compulſion and ill-treatment will only diſguſt him irreclaimably; ſtroaking him gently along the back, clapping him, giving him occaſionally boiled barley, ground beans, and ſuch other aliments as pleaſe him beſt, all of them mingled with ſalt, of which he is very fond, will prove of the greateſt uſe. At the ſame time his horns ſhould be often tied, and ſome days after the yoke is to be put on his neck, and faſtened to a plough, with another ox of the ſame ſize ready trained; theſe are to be tied together at the manger, and in the ſame manner led to the paſture, that they may become acquainted, and accuſtomed to have one common motion. The goad is never to be made uſe of in the beginning, as that would only render him more untractable; he muſt alſo be indulged, and labour only at ſhort intervals; for till he is thoroughly trained, he tires himſelf very much; and for the ſame reaſon he is to be fed more plentifully than at other times.

An ox is to draw the plough only from his third to his tenth year, when it will be adviſeable to fatten and ſell him, as being then of a better fleſh than if he was kept longer. The age of this creature is known by his teeth and horns. The firſt fore-teeth, which he ſheds at the end of ten months, are re-placed by others; larger, but not ſo white; at ſix months the teeth next to thoſe in the middle fall out, and are alſo re-placed by others; and in three years all the inciſive teeth are renewed. They are then equal, long, and pretty white; but as the ox advances in years, they wear, become unequal and black. It is the ſame in the bull and cow; ſo that the growth and ſhedding of the teeth are not affected by caſtration, or the difference of ſexes. Nor is the ſhedding of the horns affected by either; as both bull, ox, and cow, loſe them alike at the end of three years; and theſe alſo are replaced by other horns, which, like the ſecond teeth, remain; only thoſe of the ox and cow are larger and longer than thoſe of the bull. The manner of the growth of theſe ſecond horns is not uniform, nor the ſhooting of them equal. The firſt year, that is the fourth year of the ox's age, two ſmall pointed horns make their appearance, nearly formed, ſmooth, and towards the head terminated by a kind of button. The following year this button moves from the head, being impelled by a corneous cylinder, which alſo lengthening, is terminated by another button, and ſo on; for the horns continue growing as long as the creature lives. Theſe buttons become annular joints, which are eaſily diſtinguiſhed in the horn, and by which the age of the creature may be readily known; counting three years for the point of the horn to the firſt joint, and one year for each of the other intervals.

OXFIELD, in our old writers, is ſaid to be a reſtitution made by a county, &c. for any wrong done in the ſame. See HUE AND CRY.

OXGANG, or OXGATE, is generally taken, in our old law-books, for fifteen acres, or as much ground as a ſingle ox can plough in a year.

OXYCRATE, *Oxycratum*, in pharmacy, &c. a mixture of vinegar and water, proper to aſſuage, cool, and refreſh: they make fomentations of oxycrate, clyſters of oxycrate, &c. The uſual proportion is one ſpoonful of vinegar to five or ſix ſpoonfuls of water.

OXYCROCEUM, in pharmacy, &c. a preparation much uſed in plaſters for fractures, &c. made as follows;

take

take yellow wax, one pound; pitch and galbanum, each half a pound; melt them over a gentle fire; and then add of venice-turpentine, myrrh, and olibanum, each three ounces; saffron, two ounces: make them into a plaſter.

OXYGLYCU, a ſpecies of drink prepared of the ſweeteſt honey-combs, macerated and boiled.

OXYMEL, in pharmacy, a compoſition of honey and vinegar, boiled to the conſiſtence of a ſyrup.

The word is derived from the Greek, ὀξὺς, vinegar, and μέλι, honey.

OXYSACCHARUM, a liquid medicine, prepared of ſugar and vinegar.

OYER, in law-books, ſeems to have been anciently uſed for what is now called aſſiſes.

OYER AND TERMINER, a commiſſion directed to the judge of aſſiſe, and other gentlemen, impowering them to hear and determine all criminal cauſes, and to try all offenders, whether for treaſon, felony, or treſpaſs.

OYER *of a Deed*, a petition to hear and peruſe any deed, upon which an action is brought. This is always granted the defendant, who may alſo take a copy of it, that he may conſider what to plead to the action.

OYES, or OYEZ, ſignifies *hear ye*; and is frequently uſed by the cryers in our courts, on making proclamation, or to enjoin ſilence.

OYSTER, or OISTER, *Oſtrea*, in zoology, a genus of bivalve ſhell-fiſh, the lower valve of which is hollowed on the inſide, and gibboſe without; the upper one is more flat; and both are compoſed of a multitude of laminæ or cruſts, and uſually ſcabrous or rough on the outer ſurface: ſome oyſter-ſhells are alſo furniſhed with tubercles, or ſpines, and others are deeply furrowed and plicated: the figure of moſt is roundiſh, but in ſome it is quite irregular.

Oyſter-ſhells are accounted drying and abſtergent, and given internally, ſudorific.

OZENA, a foul malignant ulcer of the noſe, which is ſometimes ſo exulcerated as to diſcharge a fœtid odor, with pieces of corrupted bones.

An ozena is generally more violent and foul, when attended with a caries of the bones; for, at firſt, the internal coat of the noſe only is ulcerated, but it extends itſelf inſenſibly into the ſlender bones, and often into the ſinuſes of the cranium, and the oſſa maxillaria, and excites a malignant caries.

It generally ariſes from an obſtinate catarrh or ſome other diſorder of the noſe, eſpecially when the blood is affected with the ſcurvy, or venereal diſeaſe; but ſometimes from acrid ſubſtances drawn into the noſe with the air, and corroding its membrane, as ſtrong ſternutatory powders, and ſometimes it proceeds from, or is joined by a polypus.

The ſigns of an ozena are diſcoverable from what has been already mentioned; but, for the event, the cure is certainly difficult, becauſe the bones, eſpecially the oſſa ſpongioſa, are ſurpriſingly tender, and not ſufficiently expoſed to view; in conſequence of which, the part affected cannot be properly cleanſed. For this reaſon the diſorder ſpreads, and at length corrodes the ſeptum, and other bones of the noſe in ſuch a manner, that the external part is deformed, and the faculties of ſpeech and reſpiration injured. Some have thought an ozena a ſufficient plea for a divorce.

The external cure ſhould be taken by external, but more particularly ſuch internal medicines as correct the blood, as antivenereals, of which mercurials and decoctions of the woods are the principal. The patient likewiſe muſt be ordered to uſe a diet moderate and light, neither ſtrong nor light ſeaſoned. When the caſe is venereal, the beſt remedy is ſalivation.

P.

PAD

P, A conſonant, and the fifteenth letter in the Engliſh alphabet; and when followed by an *h* in the ſame word, it ſounds like an *f*, as in *Philemon*, *Filemon*, &c.

In the ancient Latin alphabet it was thus written Γ, and ſo in the oldeſt Greek; but in time, the angular point being rounded off, it became as in its preſent figure.

The ſound is made by expreſſing the breath ſomewhat more ſuddenly than in forming that of B, otherwiſe nearly the ſame. The P is not ſounded in *pſalms*, *Ptolemy*, &c. nor the *ph* in *phthiſic*.

P, in the Italian muſic, denotes *piano*, ſoft; that is, the force of the voice or inſtrument is to be diminiſhed, ſo as to make a kind of echo. *p p*, *piu piano*, that is, more ſoft; and *p p p*, *pianiſſimo*, ſofteſt of all, or a third echo, the voice being almoſt loſt in the air.

P. M. in aſtronomy, denotes *poſt meridiem*, or afternoon; ſometimes *poſt mane*, after morning, that is, after midnight.

P, in antiquity, was a numeral letter, denoting the ſame with G, namely, an hundred, and when a daſh was put at the top thus $\bar{P}$, it ſtood for 400,000.

P, in medicine, denotes *pugil*, or the eighth part of a handful.

P. Æ, in medicine, *partes æquales*, equal parts, the ſame with *ā* or *ana*.

P P. in medicine, *pulvis patrum*, the Jeſuit's bark in powder, ſo called, as theſe fathers were the firſt who brought it into Europe.

PACE, *Paſſus*, a meaſure taken from the ſpace between the two feet of a man, in walking; uſually reckoned two feet and a half, and in ſome men a yard or three feet.

The geometrical pace is five feet; and 60,000 ſuch paces make one degree of the equator.

PACE in the manage, is of three kinds, viz. walk, trot, and gallop; to which may be added an amble, becauſe ſome horſes have it naturally.

PACK, in commerce, denotes a quantity of goods, made up in loads, or bales, for carriage.

A pack of wool is ſeventeen ſtone and two pounds, or a horſe's load.

PACOS, in zoology, a ſpecies of Peruvian camel, without any gibboſity, erroneouſly reckoned by ſome a ſheep: it is only three feet and a half high, from the ground to the top of the back; but the neck is very long, ſo that when the head is carried erect it is pretty tall.

PACK, or PACTION, *Pactum*, in law, denotes a contract, or agreement, between two or more parties.

PACTA CONVENTA, in Poland, are the articles agreed on between the king and the republic, which they mutually oblige each other to obſerve.

PADDLE, in glaſs-making, an inſtrument with which the work-men ſtir about the ſand and aſhes in the calcar.

PADDOC, or PADDOC COURSE, a piece of ground encompaſſed with pales or a wall, and taken out of a park for exhibiting races with grey-hounds, for plates, wagers, or the like.

PADUS, the laurel, or birds cherry in botany, a genus of plants, the corolla whereof conſiſts of five large, roundiſh, patent petals, inſerted by their ungues into the

PAG

edge of the calyx: the fruit is a roundiſh drupe, and the ſeeds is an oval, acuminated nut, with a furrow: the receptacle of the flower, which inveſts the inner ſurface of the cup, is hairy in this genus.

PÆAN, among the ancient pagans, was a ſong of rejoicing ſung in honour of Apollo, chiefly uſed on occaſions of victory and triumph.

PÆAN, in the ancient poetry, a foot conſiſting of four ſyllables.

PÆDARTHROCACES, in ſurgery, is a diſeaſe of the bones, raiſing them into tumors near the joints, and differing from the ſpina ventoſa, in that it is not attended either with violent pains, or eroſions of the bone and adjacent parts. The word is derived from the Greek παις, a child, αρθρον a joint, and κακον, an evil, ſignifying, that it is a diſorder of the joints, to which children are principally ſubject; which is the caſe, becauſe the bones of children, being ſofter than thoſe of adults, are therefore the more eaſily diſtended by humours, and more frequently raiſed into tumors: theſe are hard in this caſe, and the adjacent ſoft parts are not inflated, and are free from redneſs, inflammation, and pain. It is, however, to be obſerved, that this diſorder, though at firſt very different from the ſpina ventoſa, is ſometimes known to degenerate into that diſorder. *Heiſter's Surgery.*

PÆDO-BAPTISM, infant-baptiſm, or that conferred on children. See the article BAPTISM.

PEONIA, male and female peony, or piony, in botany, a plant with large leaves, divided deeply into oblong ſegments, or rather compoſed of a number of theſe ſegments ſet on divided pedicles: on the tops of the branches grow large roſe-like flowers, followed each by two or more horned pods, internally of a deep red colour, containing roundiſh ſhining red or black ſeeds. The male ſort has dark green leaves, pale red ſingle flowers, long thick roots, and the ſtalks and pedicles ſtreaked with red: the female has longer, narrower and paler leaves, deep red double flowers, and irregular roots, compoſed of ſeveral tuberous pieces hanging by tough filaments from one head. They are both found wild in ſome parts of Europe, and cultivated with us in gardens: they are perennial, produce their flowers in May, and very ſoon ſhed them.

The male peony has been generally preferred for medicinal uſe; but the female, which is the largeſt and moſt elegant, and for this reaſon the moſt common, is the ſpecies which the ſhops have been principally ſupplied with. In quality, there does not appear to be any material difference betwixt the two; and hence the college allow both ſorts to be taken indiſcriminately.

The roots, flowers, and ſeeds, are looked upon as lightly anodyne and corroborant; to the latter, at leaſt, of which virtues, they appear from experience to have ſome claim. They have been principally recommended in ſpaſmodic and epileptic complaints; in which, we are afraid, their effects are not very conſiderable.

PAGAN, *Pagamus*, a heathen, gentile, or idolater; one who adores falſe gods.

PAGANALIA, certain feſtivals obſerved by the ancient Romans in the month of January. They were inſtituted by Servius Tullius, who appointed a certain number of villages (pagi) in each of which an altar was to be raiſed for annual ſacrifices to their tutelar gods; at

which all the inhabitants were to aſſiſt, and give preſents in money, according to their ſex and age, by which means the number of country-people was known. The ſervants upon this occaſion offered cakes to Ceres and Tellus, to obtain plentiful harveſts.

PAGANISM, the religious worſhip and diſcipline of pagans; or, the adoration of idols and falſe gods. See IDOLATRY.

The gods of paganiſm were either men, as Jupiter, Hercules, Bacchus, &c. or fictitious perſons, as Victory, Fame, Fever, &c. or beaſts, as Egypt, Crocodiles, Cats, &c. or finally, inanimate things, as Onions, Fire, Water, &c.

PAGE, a youth of ſtate retained in the family of a prince or great perſonage, as an honourable ſervant, to attend in viſits of ceremony, do meſſages, bear up trains, robes, &c. and at the ſame time to have a genteel education, and learn his exerciſes. The pages in the king's houſhold are various, and have various offices aſſigned them, as pages of honour, pages of the preſence-chamber, pages of the back ſtairs, &c.

PAGEANT, a triumphal car, chariot, arch, or other like pompous decoration, variouſly adorned with colours, flags, &c. carried about in public ſhews, proceſſions, &c.

PAGOD, or PAGODA, a name whereby the Eaſt-Indies call the temple in which they worſhip their gods.

The pagod uſually conſiſts of three parts, the firſt is a vaulted roof ſupported on ſtone or marble-columns. It is adorned with images, and, being open, all perſons without diſtinction are allowed to enter it: the ſecond part is filled with groteſque and monſtrous figures, and no body is allowed to enter it but the bramins themſelves: the third is a kind of chancel, in which the ſtatue of the deity is placed: it is ſhut up with a very ſtrong gate. This word is ſometimes uſed for the idol, as well as for the temple.

PAGOD, or PAGODA, is alſo the name of a gold and ſilver-coin, current in ſeveral parts of the Eaſt-Indies.

PAIN, *Dolor*, is defined to be an uneaſy ſenſation ariſing from a ſudden and violent ſolution of the continuity, or ſome other accident in the nerves, membranes, veſſels, muſcles, &c. of the body; or, according to ſome, it conſiſts in a motion of the organs of ſenſe; and, according to others, it is an emotion of the ſoul occaſioned by theſe organs.

There are various kinds of pain, one is attended with pulſation, another with a ſenſe of incumbent weight, another with a tenſion; there is a pain which attends eroſion, inciſion, punction, and perforation, comprehended with theſe and the like differences under the name acute; and, laſtly, there is a pain attended with a torpor and numbneſs.

Beſides the above-mentioned, there are other diſtinctions of pain: thus ſome pains are fixed, others moveable and wandering, as it often happens in a redundance of humours; ſome pains are continual, and others intermittent; ſome intenſe, others remiſs; ſome again afflict the patient in the beginning of the diſeaſe, others afterwards; and ſometimes they ariſe on the critical day, ſometimes not; and to mention no more, ſome pains are ſeated in the external parts, others in the internal; ſome in the noble, others in the ignoble parts.

All pain proceeds from ſome injury done to the parts affected; and, according to Galen, it proceeds either from a ſudden alteration of the part, or a new temperament ſuddenly induced, or elſe from a ſolution of continuity. The internal parts ſuffer pain from the violence of a fever, by which the nervous parts are dried and vellicated, or from a inflammation, an eryſipelas, ſome great obſtruction or abſceſs in the viſcera, or, laſtly, from a flatus. Now ſince theſe pains owe their riſe to ſuch cauſes, they are juſtly denominated bad, as well when alone, as when attendant on other diſtempers: for all pain exhauſts the ſtrength, promotes crudities, and impedes the concoction of the humours. The worſt pains are thoſe excited in the viſcera and noble parts; and of theſe the moſt pernicious on all accounts are pains affecting the viſcera in a violent manner, and of a long and conſtant duration, by which the natural heat of the viſcera is deſtroyed, or reſolved, and no room left to hope for a happy event.

Pain is mitigated or aſſwaged divers ways; as, 1. By diluting and ſoftening acrimonies with warm water mixed with flour applied by way of drink, fomentation, clyſter, or bath. 2. By reſolving and waſhing away obſtructions by the ſame means, and reſolvents. 3. By relaxing the nervous veſſels with drinks, fomentations, baths, relaxants, anodynes, and aperients. 4. By correcting the acrimony itſelf with proper remedies. 5. By freeing the obſtruent, obſtructed, and acrimonious parts from the too great preſſure of the vital humours, and by ſoftening, ſuppurating, and depurating them. 6. By rebating or deadening the ſenſe by narcotics, either internally or externally.

PAIN FORT ET DURE, in law, ſignifies a particular puniſhment inflicted on a perſon who being arraigned for felony, refuſes to put himſelf upon the common trial of God and his country, but inſtead thereof obſtinately ſtands mute: this puniſhment is vulgarly called preſſing to death.

PAINTING, *Pictura*, the art of repreſenting figures, countries, towns, and other things in colours. It is not to be doubted, but that painting is ancient as well as ſculpture, but it is hard to know the real time and place where they began to appear. The Egyptians and Greeks who pretend to be the inventors of thoſe arts which are moſt for the ſplendor of life, pretend that they were the firſt carvers and painters; however it is certain that painting, after having ſome weak beginnings, appeared in its perfection among the Greeks, and that the principal ſchools, where this art was taught, were at Sicyone, a town of Peloponneſus, at Rhodes, and Athens: from Greece it paſſed into Italy, where it was in great eſteem about the end of the republic, and under the firſt emperors, until at laſt, war and luxury having diſmembered the Roman empire, it became extinct, as well as other ſciences and arts, and did not begin to revive again, till the famous Cimabue laboured at it, and recovered from the hands of certain Greeks, ſome ſlender remains of this art. Some Florentines, having ſeconded him, were thoſe that gained moſt reputation, yet it was long before any conſiderable painting was produced. Le Ghirlandais, Michael Angelo's maſter, acquired the moſt credit; but Michael Angelo, his ſcholar, in the time of pope Julius II, at the beginning of the fifteen century, eclipſed the glory of all that went before him, and erected a ſchool at Florence. Peter Perugin and Raphael de Urbin, who excelled him very much, and even Michael Angelo himſelf, formed a ſchool at Rome, conſiſting of ſeveral excellent painters; at the ſame time the ſchool of Lombardy was ſet up, and was famous under Georgion and Titian, who had Julian Bellino for his maſter; beſides which, there were alſo in Italy ſome other particular ſchools, under different maſters; amongſt the reſt, that of Leonardo da Vinci at Milan, but the three firſt are eſteemed the moſt famous, the reſt having proceeded from them; but, over and above theſe, there were on this ſide the mountains ſome painters who had nothing to do with thoſe of Italy, as Albert Durer in Germany, Holbens in Swiſſerland, Lucas in Holland, and ſeveral others that wrought in France and Flanders in a different manner; but Italy, and Rome eſpecially, was the place where this art was practiſed in its greateſt perfection, and where from time to time were brought up excellent painters. The ſchool of Raphael was ſucceeded by that of Caracchio, which hath almoſt laſted till now in its height and perfection; but at preſent there is little of it in Italy, this art ſeeming to have paſſed into France, ſince Lewis XIV. hath ſet up academies for thoſe that practiſe it. We have ſaid before, that the firſt invention of this art of painting is not certainly known; but it is agreed, that he who firſt attempted drawing, made his firſt eſſay upon a wall, by drawing the ſhadow of a man, which the light diſcovered; and, to give the greater beauty to this ſtory, ſome write that it was a girl who thus deſigned the face of her lover. Some allege that it was one Philocles, of Egypt, who firſt reduced this invention into practice; others name Cleanthes of Corinth, and others again ſay, that Ardices, a Corinthian, and Telephanes of Clarentia in Peloponneſus, began to draw without

without colours, with a coal only; and that the firſt who made uſe of one colour in painting, was one Cleophantes of Corinth, and for that reaſon called Monochromatos: after him, it is ſaid that Higienontes, Dinias, and Charmas were the firſt that drew pictures in one colour only. Eumarus of Athens, at laſt, painted both men and women in a different manner; his diſciple, Simon, the Cleonian, began to paint the body in various poſtures, and to repreſent the joints and limbs, the veins, and the foldings of the drapery; however, it is certain, that in the time of Romulus, and about the fifteenth Olympiad, that is, 715 years before Chriſt's incarnation, Candaules, ſirnamed Myrſilus, king of Lydia, bought, for its weight in gold, a picture of Bularchus's painting, in which was repreſented the battle of the Magneſians. Panæus, the brother of Phidias, was in eſteem in the eighty-third Olympiad, 448 years before our Saviour. Polygnotus, the Thaſian, was the firſt that put thought and paſſion in the face, and gave force and beauty to the colours; he did ſeveral things at Delphos and Athens. At the ſame time Mycon made himſelf famous, alſo, in Greece. About the ninetieth Olympiad appeared Aglaophon, Cephiſſodones, Phrillus, and Evener, the father of Parrhaſius; all theſe painters were excellent in the art, but Apollodorus exceeded them all; he lived in the ninety-third Olympiad, 408 years before the birth of our Lord; his manner was imitated by Zeuxis, Parrhaſius, the great Apelles, and ſeveral others, till the reign of Auguſtus. It is not known what painters have wrought in Italy ſince the reign of this emperor. When the Conſtantines and Theodoſian took upon them the protection of the church, theſe Chriſtian emperors cauſed ſome carving and painting works to be made for the ornaments of the churches, but we have almoſt nothing conſiderable of the remains of thoſe pieces. It is probable, one reaſon of the decay of painting was occaſioned by the ſecond council of Nice's decreeing religious worſhip to be paid to the images of our Saviour and the ſaints: this practice being looked on by a great part of the church as a dangerous and unwarrantable innovation, ſeveral of the Greek emperors made a vigorous oppoſition againſt it; and the better to ſuppreſs theſe exceſſes, ordered the images, &c. to be taken out of the churches and defaced; and by this means the art itſelf fell under a great diſcouragement. But, after the year 1270, the famous Cimabue reſtored the art of painting, which was perfected by the painters of the ſucceeding age. About the beginning of the fifteenth century, there were famous painters in the Low-Countries, and in Germany. *Rollin.*

Cleaning Pictures and PAINTINGS.—The art of cleaning pictures and paintings is of great conſequence to the preſerving valuable works of that kind: but has been very little underſtood even by thoſe who profeſs to practiſe it; on which account many valuable pictures have been damaged: and indeed few eſcape without damage, in a greater or leſs degree, which come under the hands of thoſe who pretend to make it their buſineſs; and yet moſt generally know no other than one ſingle way of treating all the ſubjects they are to operate upon, however different may be the condition or circumſtances of them.

As a painting may be, however, fouled with a variety of different kinds of matter, many of which will not be diſſolved, or ſuffer their texture to be deſtroyed by the ſame ſubſtances, it is neceſſary to know what will diſſolve or corrode each ſuch kind; for there is no other means of removing, or taking off any foulneſs, than by diſſolving or corroding by ſome proper menſtruum, the matter which conſtitutes it, except by actual violence, which the tender nature of oil paintings by no means ſuffer them to bear. Of theſe ſubſtances, which will remove, by diſſolving or corroding it, the matter which may foul paintings, ſome are very apt likewiſe to act upon and diſſolve the oil in the painting itſelf; and conſequently to diſorder or bring off the colours; while others are, on the contrary, paſſive and innocent, with reſpect to the painting; and may be uſed freely, or indeed in any quantity whatever, without the leaſt inconvenience of this kind.

As paintings to be cleaned are likewiſe varniſhed with a variety of ſubſtances of different natures, which ſometimes require to be taken off, and at other times are much better left remaining, it is very neceſſary to be able to judge what is beſt to be done in this point; as likewiſe to know the means by which each ſort of varniſh may be taken off without injury to the painting: for in fact, without this, there is no way of cleaning pictures, in ſome circumſtances, but by ſcouring till, as well the ſurface of the picture as the foulneſs be cleared away. We ſhall therefore firſt give ſome account of the nature of the ſubſtances which are, or may be, uſed for cleaning paintings in oil, as it regards this application of them; and then ſhew how they may be uſed, as well for the taking off the varniſh, as the removing any foulneſs that may be either upon or under it.

The firſt and moſt general ſubſtance uſed for cleaning pictures is water. This will remove many kinds of glutinous bodies, and foulneſs ariſing from them; ſuch as ſugar, honey, glue, and many others, and alſo take off any varniſh of gum-arabic, glair of eggs, and iſinglaſs; and is therefore the greateſt inſtrument in this work. It may be uſed without any caution, with regard to the colours, as it will not in the leaſt affect the oil which holds them together.

Olive oil, or butter, though not applied to this purpoſe, through an ignorance of their efficacy, will remove many of thoſe ſpots or foulneſs which reſiſt even ſoap; as they will diſſolve or corrode pitch, roſin, and other bodies of a like kind, that otherwiſe require ſpirit of wine, and oil of turpentine, which endanger the painting: and they may be uſed very freely, not having the leaſt effect on the oil of the painting.

Wood-aſhes, or what will better anſwer the purpoſe, when uſed in a proper proportion, pearl aſhes, being melted in water, make a proper diſſolvent for moſt kinds of matter which foul paintings; but they muſt be uſed with great diſcretion, as they will touch or corrode the oil of the painting, if there be no varniſh of the gum-reſins over it, ſo as to render the colours liable to be injured by very little rubbing. The uſe of them, or ſoap, is, however, in many caſes unavoidable, and in general they are the only ſubſtances employed for this purpoſe.

Soap is much of the ſame nature with the laſt-mentioned ſubſtances; being indeed only oil incorporated with ſalts of the ſame kinds, rendered more powerfully diſſolvent by means of quick-lime: for which reaſon it is ſomething more efficacious; but conſequently more hazardous, as it will the ſooner get hold of the oil of the paintings. It ſhould, therefore, not be uſed but on particular ſpots, that elude all other methods, and there with great caution.

Spirit of wine, as it will diſſolve all the gums, and gum-reſins, except gum-arabic, is very neceſſary for the taking off from pictures varniſhes compoſed of ſuch ſubſtances; but it corrodes alſo the oils of the paintings, and ſoftens them in ſuch a manner, as makes all rubbing dangerous while they are under its influence.

Oil of turpentine will likewiſe diſſolve ſome of the gums uſed for varniſh; but ſpirit of wine will in general much better anſwer that purpoſe. There are, however, ſometimes ſpots of foulneſs, which will give way to ſpirit of turpentine, that reſiſt moſt other ſubſtances uſed in this intention; and it may, therefore, be tried where they apper to fail, but very ſparingly, and with great caution, as it will very ſoon act even on the dry oil of the painting.

Eſſence of lemons has the ſame powers as oil of turpentine; but is, moreover, a much ſtronger diſſolvent, and ſhould therefore only be uſed in deſperate caſes, where ſpots ſeem indelible with regard to all other methods. Spirit of lavender and roſe-mary, and other eſſential oils, have the ſame diſſolving qualities as eſſence of lemons; but they are in general dearer, and ſome of them too powerful to be truſted near the colours.

Whenever paintings are varniſhed with gum arabic, glair of eggs, or iſinglaſs, the varniſh ſhould be taken off when they are to be cleaned. This may be eaſily diſtinguiſhed by wetting any part of the painting, which will feel clammy, if varniſhed with any ſubſtance diſſolvible in water. In ſuch caſes, the taking off the varniſh will frequently alone render the painting entirely clean; for if it have been laid on thick, and covered the ſurface every where, the foulneſs muſt neceſſarily lie upon it. The manner of taking off this kind of varniſh muſt be done

done by means of hot-water and a ſponge, the picture, or painting, being laid horizontally. The water may be nearly boiling hot, and may be uſed copiouſly at firſt with the ſponge; but when the varniſh appears to be ſoftened, and the painting more naked, it ſhould be uſed cooler; and, if the varniſh adhere, ſo as not to be eaſily brought off by a ſponge, a gentle rubbing with a linen cloth may be uſed; the cloth being frequently wrung, and wet again with freſh water a little warmiſh.

Where paintings appear, by the above trial, to be varniſhed with the gum-reſins, or ſuch ſubſtances as cannot be diſſolved in water, it is proper, nevertheleſs, to waſh them well with water pretty warm, by means of a ſponge, which will ſometimes be alone ſufficient to clean them, even in this caſe: but if there yet appear any foulneſs, rub the painting over with olive-oil made warm, or butter; and if any parts appear ſmeary, or any foulneſs ſeem to mix with the oil or butter, purſue the rubbing gently, taking off the foul oil, and adding freſh till all ſuch foulneſs be wholly removed. Let the oil be then wiped off with a woollen cloth, and if the picture require further cleaning, the wood-aſhes, or pearl-aſhes, muſt be uſed in the following manner; which, indeed, as to the firſt part, is not widely different from the method commonly uſed.

"Take an ounce of pearl-aſhes, and diſſolve them in a pint of water; or take two pounds of wood-aſhes, and add to them three quarts of water, and ſtir them well in the water once or twice in an hour, for half a day; and then, when the earthy part of the aſhes has ſubſided, pour off the clear fluid, and evaporate it to a quart; or if it appear acrid to the taſte at that time, three pints may be left. Waſh, by means of a ſponge, the painting well with either of theſe ſolutions, or lyes, which are in fact the ſame thing, made warm; and rub any particular ſpots of foulneſs gently with a linen cloth till they diſappear: but if they appear to remain unchanged by the lye, do not endeavour to take them off by mere force of rubbing; for that would infallibly damage the colours under the ſpots, before they could be removed: but in this caſe they ſhould be left to be tried by the ſpirit of wine, or the eſſential oils of turpentine and lemons. Where thick ſpots ſeem to give way in part, but yet reſiſt in a degree to this lye, a little ſtrong ſoap ſuds may, in ſome caſes, be uſed, with great caution; but it ſhould be prevented as much as poſſible, from touching any part of the painting, except the ſpot itſelf; and as that diſappears, the ſoap-ſuds ſhould be diluted with water, that it may not reach the oil of the colours in its full ſtrength. If, however, all this be done upon a ſtrong coat of varniſh, there will be leſs hazard; and, in ſuch caſes, the waſhing freely with the wood aſh lye, or weak ſoap-ſuds, will frequently do the buſineſs effectually, without any material damage: but it requires ſome judgment to know where paintings may be freely treated; and, with reſpect to thoſe of great value, it is always beſt to proceed by more circumſpect methods, and to try the more ſecure means we have above directed, before theſe rougher be uſed."

Some uſe the wood-aſhes, with the addition of water only, without ſeparating the ſolution of the ſalts from the earth; which, when ſo uſed, aſſiſts in ſcrubbing the foulneſs from the painting; but all ſuch practices are to be condemned; as the finer touches of the painting are always damaged in a greater or leſs degree, where any abrading force is employed in cleaning it.

Where ſpots appear, after the uſe of all the above-mentioned methods, ſpirit of wine, or if that fail, oil of turpentine, and in the further caſe of its default, eſſence of lemons muſt be applied. The ſpots ſhould be lightly moiſtened with them; avoiding to ſuffer them to touch any more of the ſurface than what is covered with the foulneſs; and the part ſhould be immediately rubbed with a linen cloth, but very gently; obſerving at the ſame time to deſiſt, if the colours appear the leaſt affected. After a little olive oil ſhould be put on the ſpot, where oil of turpentine and eſſence of lemons are uſed, and water where ſpirit of wine is applied; which being taken off by a woollen cloth, if the foulneſs be not wholly removed, but appears to give way, the operation muſt be repeated till it be entirely obliterated.

Where paintings appear to have been varniſhed with thoſe ſubſtances that will not diſſolve in water, and after the careful uſe of the above means the foulneſs ſtill continues, or where, as is very often found, the turbidneſs, or want of tranſparency, or the yellow colour of the varniſh, deprave the painting ſo as to deſtroy its value, ſuch varniſh muſt be taken off; the doing of which, though attended with the greateſt difficulty to thoſe who proceed by the methods now in uſe, and which indeed is ſeldom done by them at all, but with the deſtruction of the more delicate teints and touches of the painting, is yet very eaſily and ſafely practicable by the following method.

"Place the picture or painting in an horizontal ſituation, and moiſten, or rather flood, by means of a ſponge, the ſurface with very ſtrong rectified ſpirit of wine; but all rubbing, more than what is neceſſary to ſpread the ſpirit over the whole ſurface, muſt be avoided. Keep the painting thus moiſtened, by adding freſh quantities of the ſpirit for ſome minutes; then flood the whole ſurface copiouſly with cold water; with which, likewiſe, the ſpirit, and ſuch part of the varniſh as it has diſſolved, may be waſhed off. But in this ſtate of it, all rubbing, and the ſlighteſt violence on the ſurface of the painting, would be very detrimental. When the painting is dry, this operation muſt be repeated at diſcretion, till the whole of the varniſh be taken off."

In pictures and paintings which have been long varniſhed, it will be found ſometimes that the varniſh has been a compoſition of linſeed-oil, or ſome other ſuſtantial oil, with gums and reſins. If ſuch paintings cannot be brought to a tolerable ſtate by any of the above-mentioned means, which may in this caſe be freely uſed, the miſchief may be deemed to be without remedy. For it is abſolutely impracticable to take off ſuch varniſh, as it is more compact and indiſſoluble than the oil of the painting itſelf; and could only be wrought upon by thoſe menſtrua and diſſolvents, which would act more forcibly on the paintings: ſuch pictures muſt, therefore, be left in the ſtate they are found, except by being freed from any foulneſs that may be upon this varniſh, and may be cleaned away by the methods we haue before directed. The coat of this varniſh may indeed be ſometimes made thinner, by anointing the ſurface of the painting with eſſence of lemons; and then putting on olive-oil, which, when rubbed off by a ſoft woollen-cloth, will carry away the eſſence with ſuch part of the varniſh as it may have diſſolved; but this requires great nicety, and can never be practiſed without ſome hazard of diſordering the colours of the painting.

Method of taking off PAINTINGS *in Oil, from the Cloths or Wood on which they were originally done; and transferring them entire, and without Damage, to new Pieces.*—The art of removing paintings in oil from the cloth or wood on which they are originally done, and transferring them to new grounds of either kind of ſubſtance, is of very great uſe; as not only pictures may be preſerved, where the canvas is ſo decayed and damaged, that they would otherwiſe fall to pieces; but paintings on cielings or wainſcot, which, when taken away from the places where they were originally placed, would have little value, may be conveyed to cloths; and, by being thus brought to the ſtate of other pictures, become of equal worth with thoſe painted originally on canvas. The manner in which this is done is, by cementing the face of the picture to a new cloth, by means of ſuch a ſubſtance as can afterwards be diſſolved, and conſequently taken off by water; deſtroying the texture of the old cloth, by means of a proper corroding fluid; and then ſeparating the corroded parts of it entirely from the painting: after which, a new cloth being cemented to the reverſe of the painting in its place, the cloth cemented to the front is in like manner to be corroded, and ſeparated; and the cemented matter cleanſed away by diſſolving it with water, and rubbing it off from the face of the picture. The particular method of doing this, with moſt convenience, is as follows.

Let the decayed picture be cleanſed from all greaſe that may be on its ſurface; which may be done by rubbing it very gently with crumbs of ſtale bread; and then wiping it with a very fine ſoft linen cloth. It muſt then be laid, with the face downwards, on a ſmooth table covered with fan paper, or the India paper; and the cloth

cloth on the reverſe muſt be well ſoaked with boiling water, ſpread upon it by means of a ſponge, till it appear perfectly ſoft and pliable. The picture is then to be turned with the face upwards; and, being ſtretched in the moſt even and flat manner on the table, muſt be pinned down to it in that ſtate, by nails driven in through the edge, at proper diſtances from each other. A quantity of glue ſhould be then melted, and ſtrained through a flannel cloth, to prevent any gravel or other impurities from lurking in it; and when it is a little ſtiffened, a part of it ſhould be ſpread on a linen cloth, of the ſize of the painting, where it ſhould be ſuffered to ſet and dry; and then another coat put over it: when this is become ſtiff alſo, the glue ſhould be again heated; and while it remains of ſuch heat as to be eaſily ſpread, it ſhould be laid over the face of the picture, and a linen cloth immediately put over it in the moſt even manner, and nailed down to the picture and table at the edge likewiſe. The glue ſhould not be uſed boiling hot, as that would hazard ſome of the more delicate colours of the painting; and the linen cloth ſhould be fine and half worn, that it may be the ſofter, and lie the flatter on the ſurface of the picture: in order to which, it is proper to heat it till the glue be ſoft and pliable before it be laid on, and to compreſs each part gently with a ball formed of a linen rag tied round with thread. The table, with the picture, cloth, &c. nailed down to it in this ſtate, ſhould be then expoſed to the heat of the ſun, in a place where it may be ſecured from rain; and there continued till the glue be perfectly dry and hard; at which time the nails ſhould be drawn, and the picture and linen cloth taken off from the table. The picture muſt now be again turned with the face downwards, and ſtretched and nailed to the table as before; and a border of wax muſt be raiſed round the edge, forming as it were a ſhallow trough with the ſurface of the picture, into which trough ſhould be poured a proper corroding fluid, to eat and deſtroy the threads of the original canvas or cloth of the picture. The corroding fluid uſed for this purpoſe may be either oil of vitriol, aquafortis, or ſpirit of ſalt; but the laſt is preferable, as it will more effectually deſtroy the thread, when it is ſo weakened by the admixture of water, as not to have any effect on the oil of the painting; which ever is uſed, it is neceſſary they ſhould be properly diluted with water: to find the due proportion of which, it is expedient to make ſome previous trials; and when they are found to be of ſuch ſtrength as to deſtroy the texture of thread without diſcolouring it, they are in the due ſtate. When the corroding fluid has done its office, a paſſage muſt be made through the border of wax at one end of it; and the fluid muſt be poured off, by inclining the table in the requiſite manner; and the remaining part muſt be waſhed away, by putting repeated quantities of freſh water upon the cloth. The threads of the cloth muſt then be carefully picked out till the whole be taken away; but if any part be found to adhere, all kind of violence, even in the leaſt degree, muſt be avoided in removing them; inſtead of which, they ſhould be again touched, by means of a pencil, with the corroſive fluid leſs diluted than before, till they will readily come off from the paint. The reverſe ſurface of the painting being thus wholly freed from the old cloth, muſt be then well waſhed with water, by means of a ſponge, till the corroding fluid employed be thoroughly cleanſed away; when being wiped with a ſoft ſponge, till all the moiſture that may be collected by that means be taken off, it muſt be left till it be perfectly dry. In the mean time a new painting, which now remains cemented to the linen cloth, put on the ſurface of it; and the reverſe of the painting being dry, and ſpread over by ſome hot glue, purified as before, and melted with a little brandy or ſpirit of wine, the new canvas muſt be laid on it, in the moſt even manner, while the glue yet remains hot, and ſettled to it by compreſſion; which may be performed by thick plates of lead or flat pieces of poliſhed marble. Great care ſhould however be taken in the laying them on, to prevent the edge from cutting or bruiſing the paint; as alſo, during the ſetting of the glue to take them off; and wipe them at proper intervals, to prevent their adhering to the cloth by means of the glue, which may be preſſed through it. The lead or marble, by which the compreſſure is made, being removed when the glue is ſet, the cloth muſt be kept in the ſame ſtate till the glue be perfectly dry and hard; and then the whole muſt be again turned with the other ſide upwards, and the border of wax being replaced, the linen cloth on the face of the painting muſt be deſtroyed by means of the corroding fluid, in the ſame manner as the canvas was before; but greater care muſt be taken with reſpect to the ſtrength of the corroding matter, and in the picking out the threads of the cloth; becauſe the face of the painting is defended only by the coat of glue which cemented the linen cloth to it. The painting muſt then be freed from the glue, by waſhing it with hot water, ſpread and rubbed on the ſurface by a ſponge; which ſhould be cleanſed frequently during the operation, by dipping and ſqueezing it in clean water. The painting may afterwards be varniſhed as a new picture; and if the operation be well conducted, it will be transferred to the new cloth in a perfect ſtate.

When the painting is originally on wood, it muſt be firſt detached from the cieling or wainſcot, where it was fixed; and the ſurface of it covered with a linen cloth, cemented to it by means of glue, in the manner before directed for the paintings on canvas. A proper table being then provided, and overſpread with a blanket, or thinner woollen cloth, if laid ſeveral doubles, the painting muſt be laid upon it with the face downwards, and fixed ſteady; and the boards or wood on which it was done muſt be planed away, till the ſhell remain as thin as it can be made, without damaging the paint under it. The proceedings muſt afterwards be the ſame as was before practiſed in the caſe of the paintings on canvas, till that on the wood be in like manner transferred to a cloth or canvas.

The whole of the above operation muſt be managed with the greateſt care, otherwiſe the painting will receive ſome damage; and ſo much nicety is required in the corroſion, and taking off the threads of the cloth, that it can ſcarcely be performed rightly, but by ſuch as have had ſome experience in the matter. It is proper, therefore, for any perſon who would practiſe it in the caſe of valuable paintings, to try it firſt with ſome old pictures of little value, till they find they have the right method of proceeding: and even then, in ſome inſtances, where the coats of paint lie very thin on the cloth, it is ſcarcely practicable without miſcarriage. But, as in the caſe of pictuers greatly decayed, or paintings on wood taken from buildings that do not admit of being commodiouſly replaced elſewhere, there can be no great loſs, if a failure ſhould happen; and a conſiderable advantage may accrue, if the experiment ſucceed; for which there is good chance, if the operation be properly conducted, and the ſubject favourable; it is very well worth while to make the trial.

PAIR, *Par*, denotes two equal and ſimilar things joined together either collectively, as a pair of gloves, or two ſimilar parts that compoſe one whole, or a ſet of things joined to make another complete, &c.

PAIR, in anatomy, an aſſemblage of two nerves, having their origin in the brain or ſpinal marrow, and thence diſtributed into the ſeveral parts of the body; one on one ſide, and the other on the other.

PALACE, *Palatium*, a name generally given to the dwelling houſes of kings, princes, and other great perſonages; and taking different epithets, according to the quality of the inhabitants, as imperial palace, royal palace, pontifical palace, cardinal palace, ducal palace, epiſcopal palace, &c.

PALÆSTRA, in Grecian antiquity, a public building, where the youth exerciſed themſelves in wreſtling, running, playing at quoits, &c.

PALANQUIN, a kind of chaiſe, or chair, borne by men on their ſhoulders, much uſed by the people of China, and the Eaſt, as a vehicle for their eaſy conveyance from place to place.

PALATE, *Palatum*, in anatomy, the fleſh that compoſes the roof, or the upper and inner part, of the mouth. See the article MOUTH.

The palate has much the ſame ſtructure with the gums, but it has alſo a great number of glands, diſcovered ſo early as the time of Fallopius: theſe are principally ſituated in the hinder part near the uvula, where it is pendulous,

in the manner of a curtain, which part is called the velum, or clauſtrum, of the palate. The glands ſituated particularly in this part, ſecrete a mucous fluid, ſerving to lubricate the mouth and throat, and to facilitate deglutition: they have a great number of apertures there for the diſcharge of this humour into the mouth.

The great uſes of this membrane are to defend the bones of the palate from corrupting, and for preventing by its clauſtrum or velum, the things to be ſwallowed from getting up into the noſtrils.

Wounds of the palate and other parts of the mouth, are only to be healed by being anointed with honey of roſes, either alone, or mixed with balſam of Peru, or with oil of myrrh per deliquium.

PALATO SALPINGÆUS, called alſo muſculus tubæ novus Valſalvæ, and pterygoſtaphylinus externus, a muſcle ariſing broad and tendinous from the edge of the lunated part of the os palati; ſeveral of its fibres being ſpread on the membrane that covers the foramen narium, whence growing into a ſmall thin tendon, it is reflected about the hook-like proceſs of the inner wing of the proceſſus pterygoidæus internus, and is inſerted carnous into all the membranous, fleſhy, and cartilaginous parts of the tube, which leads from the palate to the ear. Its uſe is to dilate and keep open this tube.

PALATO-STAPYLINUS, in anatomy, a muſcle ariſing on each ſide from the junction of the bones of the palate. It is broad at its beginning, but afterwards joins its aſſociate, and becomes then narrower, ſo as to reſemble a triangle, which deſcends from the place of its origin to the uvula, and is inſerted into its upper part: it draws it upward and forward.

PALE, *Palus*, a little pointed ſtake or piece of wood, uſed in making incloſures, ſeparations, &c.

PALE, in heraldry, one of the honourable ordinaries of an eſcutcheon; being the repreſentation of a pale or ſtake placed upright, and comprehending the whole height of the coat from the top of the chief to the point.

PALED FLOWERS, in botany, are thoſe which have their leaves ſet about, or ſurrounding, an head, or thrum, as in marigolds, &c.

PALESTINE, a part of Aſiatic Turky, ſituated between thirty-ſix and thirty eight degrees of eaſt-longitude, and between thirty-one and thirty-four degrees of north latitude: it is bounded by Mount Libanus, which divides it from Syria on the north; by Mount Herman, which ſeparates it from Arabia Deſerta on the eaſt; by the mountains of Seir, and the deſarts of Arabia Petræa, on the ſouth; and by the Mediterranean ſea on the weſt.

It was called Paleſtine from the Philiſtines, who inhabited the ſea-coaſts. It was alſo called Judea, from the patriarch Juda; and the Holy Land from our Saviour's reſidence and ſufferings in it; and it is called Canaan, and the Promiſed Land in the Scriptures.

It is one hundred and fifty miles in length, and eighty in breadth; and in the time of Solomon it ſeems to have extended from the Mediterranean ſea to the river Euphrates.

PALILIA, a feaſt among the ancient Romans, in honour of the goddeſs Pales.

The palilia were celebrated with great feſtivity by the ſhepherds on the firſt of May, to beſeech that goddeſs to take care of their flocks, and preſerve them from wolves and diſeaſes. Part of the ceremony conſiſted in burning heaps of ſtraw, and jumping over them.

PALILICIUM, in aſtronomy, the ſtar called the bull's-eye, or aldebaran. See ALDEBARAN.

PALINDROMUS, παλινδρομος, a verſe or ſentence which runs the ſame when read either backwards or forwards; ſuch is the verſe,

Roma tibi ſubito motibus ibit amor.

PALING, a ſort of fencing for fruit-trees planted in fields, wherein three ſmall poſts are erected at a foot and a-half diſtance one from another, and near the top nailed to each other with croſs-bars. In fixing the pales in form of a triangle, room is to be left for the tree to play and bow by the high winds, without galling: the trees are to be bound to a ſtake for a year or two, after which, fern or ſtraw may be ſtuffed in betwixt the tree and upper-moſt rails, to keep it upright. If the place be open to deer, rabbits, or the like, a poſt is to be nailed to the bar between every two pales.

PALISADE, or PALISADO, in fortification, an incloſure of ſtakes or piles driven to the ground, each ſix or ſeven inches ſquare, and eight feet long, three whereof are hid under-ground.

Paliſadoes are generally uſed to fortify the avenues of open forts, gorges, half-moons, the bottoms of ditches, the parapets of covert-ways, and in general all poſts liable to ſurprize, and to which the acceſs is eaſy. Paliſadoes are uſually planted perpendicularly, though ſome make an angle inclining towards the ground next the enemy, that the ropes caſt over to tear them up may ſlip.

Turning PALISADES are an invention of M. Coehorn, in order to preſerve the paliſades of the parapet of the covert-way from the beſiegers ſhot.

He orders them ſo, that as many of them as ſtand in the length of a rod, or in about ten feet, turn up and down like traps, ſo as not to be in ſight of the enemy, till they juſt bring on their attack, and yet are always ready to do the proper ſervice of paliſades.

PALISADE, in gardening, denotes a ſort of ornament; being a row of trees which bear branches and leaves from the bottom, cut and ſpread in manner of a wall along the ſide of an alley, or the like, ſo as to appear like a wall covered with leaves.

PALISSE, in heraldry, a bearing like a range of paliſades before a fortification, repreſented on a feſſe, riſing up a conſiderable height, and pointed a-top, with a field appearing between them.

PALL, in heraldry, denotes a kind of croſs repreſenting the pallium, or archiepiſcopal ornament ſent from Rome to the metropolitans.

PALLADIUM, in antiquity, a ſtatue of the goddeſs Pallas, ſuppoſed to have dropped down from heaven, preſerved in Troy, whereon the fate of that city is ſaid to have depended.

PALLET, among painters, a little oval piece of wood, &c. very thin and ſmooth; on which they place the colours they have occaſion for, ready for the pencil; it has a hole at one end to put the thumb through, to hold it.

PALLET, among potters, crucible makers, &c. a wooden inſtrument, almoſt the only one they uſe, for forming, heating, and rounding their works: they have ſeveral kinds, the largeſt are oval, with a handle; others are round, or hollowed triangularly; others, in fine, are in manner of large knives, ſerving to cut off whatever is ſuperfluous on the moulds of their work.

PALLET, in gilding, an inſtrument made of a ſquirrel's tail, to take up the gold leaves from the pillow, and to apply and extend them on the matter to be gilt.

PALLET, in heraldry, is nothing but a ſmall pale, conſiſting of one half of it in breadth; and therefore there are ſometimes ſeveral of them upon one ſhield.

PALLET is alſo a part belonging to the ballance of a watch or movement. See WATCH.

PALLIATION, or a PALLIATIVE CURE, in medicine, is when, in deſperate and incurable diſeaſes, after predicting the fatal event, the phyſician preſcribes ſome remedies for mitigating the pain, or ſome other urgent ſymptoms, as in ulcerated cancers, or cancerous fiſtulas, and the like.

PALLIER, or PAILLIER, in building, denotes a landing-place in a ſtair caſe.

PALLIUM, or PALL, an archiopiſcopal veſtment, of white woollen cloth, about the breadth of a border, made round, and thrown over the ſhoulders. Upon this border there are two others of the ſame matter and form, one of which falls down upon the breaſt, and the other upon the back, each having a red croſs upon it: ſeveral croſſes of the ſame colour being likewiſe upon the upper part of it, about the ſhoulders.

PALM, *Palma*, in anatomy, the inſide of the hand, called alſo vola. See the article HAND.

PALM is alſo a meaſure of length. See the article MEASURE.

PALM-SUNDAY, in the Chriſtian church, the Sunday next before before Eaſter; being ſo called in memory of our

our Saviour's triumphal entry into Jeruſalem, when the multitude that attended him ſtrewed palm branches in his way.

PALMARIS Musculus, one of the flexor muſcles of the hand, ſo called as being inſerted into the palm of the hand by a broad expanded tendon: its office ſeems to be the conſtriction of the palm. There is alſo another muſcle of the hand called palmaris brevis, and quadratus, in form of a ſmall maſs of fleſh, which adheres to the aponeuroſis of the former muſcle, above the abductor muſcle of the little finger; it is ſaid to aſſiſt in drawing together the hand; but Heiſter obſerves, that both theſe muſcles are found wanting in diſſections.

PALPABLE, ſomething perceivable by the ſenſes, particularly that of feeling.

PALPEBRÆ, the eye-lids, in anatomy. See the article Eye.

PALPITATION, in medicine, a ſpaſtic contraction of the heart, when it leaps and beats violently.

PALSY, παραλυσις, in medicine, a diſeaſe wherein the body, or ſome of its members, loſe their motion, and ſometimes their ſenſation or feeling.

The apoplexy, ſays Dr. Mead, when not mortal, frequently terminates in a palſy, which is the criſis of the diſeaſe: this palſy generally ſeizes but one ſide of the body; and what Morgagni obſerves, after Valſalva, that, on diſſection of the bodies of apoplectics, who had been ſeized with a hemiplegia, he always found the cauſe of the diſeaſe in the oppoſite ſide of the brain, the doctor ſays he has formerly found true more than once in St. Thomas's hoſpital. There is now no longer any room for blood-letting, or draſtic purges; it will be ſufficient to give warm and moderate cathartics now and then, ſuch as the tinctura ſacra. And as the diſeaſe is now become chronical, inſtead of bliſters, it will be requiſite to make iſſues in proper places, eſpecially in the nape of the neck, and above the ſcapulæ, either with the actual cautery, or with cauſtic medicines. Hippocrates adviſes to apply the actual cautery in eight places, at leaſt, and ſpecifies them.

The cure is to be chiefly proſecuted with aromatic ſtrengtheners and ſteel; and beſides, it is of ſervice to ſtimulate the ſkin of the paralytic part; which is extremely well effected by the green ointment, mixed with the ſeventh or eighth part of the ſtrong ſpirit of vitriol; and when the part begins to be rubified, the liniment is to be removed, and the part anointed with ointment of elder. Cold bathing is very beneficial in perſons not too far advanced in years, but hot bathing is prejudicial to all paralytics; ſome of whom the doctor has known ſent to Bath by a miſtaken notion of their phyſicians, who, upon coming out of the bath, were ſeized with a return of the apoplexy, which carried them off.

Wherefore the doctor makes the following remarks on theſe waters. Their chief virtue ſeems to conſiſt in a certain mineral heat, whereby they warm and cheriſh the ſtomach and inteſtines; and, therefore, they are chiefly ſerviceable to thoſe who have ruined their appetite and digeſtive faculty by drinking wine or other ſpirituous liquors, which is well known to be the cauſe of a number of evils: but they are very prejudicial to all whoſe inward parts, as the brain, lungs, liver, or kidnies, are too hot. And, for the ſame reaſon, though they may be agreeable to, and mend, the ſtomach, yet, if the uſe of them be continued too long, they more frequently hurt this organ: that very warmth which was beneficial at firſt, by immoderate perſeverance, becoming prejudicial, by over-relaxing the fibres. A circumſtance which the doctor ſeveral times obſerved, more particularly in patients whoſe diſeaſes were owing to a fault in the nervous fluid.

This diſeaſe never is acute, is often tedious, and in old people almoſt incurable; and the patient for the moſt part drags a miſerable life. For the vigour of his mind, together with his memory are loſt, or vaſtly impaired; he totters and ſhakes, and becomes a diſmal ſight; as if no longer a man, but an animal half dead.

PALUMBUS, the ring-dove, a beautiful ſpecies of pigeon, with the neck white on each ſide, and a brown ſpot behind. See Columba.

PALY, or Pale, in heraldry, is when the ſhield is divided into four or more equal parts, by perpendicular lines falling from the top to the bottom.

Paly-bendy is when the eſcutcheon is divided by perpendicular lines, which is paly; and alſo by diagonals, which is called bendy.

PAMPINIFORME Corpus, in anatomy, a plexus, or knot, formed by the ſpermatic veins and arteries, and included in a common coat, within the teſticle. See the article Testicle.

PANACEA, among phyſicians, denotes an univerſal medicine, or a remedy for all diſeaſes; a thing impoſſible to be obtained, according to no leſs an author than Boerhaave.

PANADA, a diet conſiſting of bread boiled in water to the conſiſtence of a pulp, and ſweetened with a little ſugar. It is given to young children, and to ſick perſons, whoſe digeſtion is weak, or where ſtronger foods would be improper. It is ſometimes made thin, to ſerve as a drink.

PANATHENÆA, παναθηναια, in Grecian antiquity, an ancient Athenian feſtival, in honour of Minerva, who was the protectreſs of Athens, and called Athena.

PANAX, ginſeng, in botany. See the article Ginseng.

PANCHYMAGOGUE, in pharmacy, a name given to ſome cathartic extracts, that have the reputation of purging off all kinds of humours.

PANCREAS, in anatomy, is a long flat gland, of that kind which anatomiſts all conglomerate, ſituated under the ſtomach, between the liver and ſpleen; its figure reſembles that of a dog's tongue, and is divided into two ſides, one ſuperior, the other inferior; two edges, one arterior, the other poſterior; and two extremities, one large, which repreſents the baſis of a tongue, and one ſmall, and a little rounded like the point of a tongue.

The word is Greek, and derived from παν, all, and κρεας, fleſh.

The pancreas is ſituated tranſverſely under the ſtomach in the duplicature of the poſterior portion of the meſocolon. The large extremity is connected to the firſt incurvation of the duodenum, and from thence it paſſes before the reſt of that inteſtine, all the way to its laſt incurvation; ſo that a great part of the duodenum lies between the pancreas and the vertebræ of the back. The ſmall extremity is fixed to the omentum, near the ſpleen.

The pancreas is compoſed of a great number of ſoft glandular molecules, combined in ſuch a manner as to exhibit the appearance of one uniform maſs on the outſide, the convexities more or leſs flatted. When theſe molecules are ſeparated a little from each other, we find, along the middle of the breadth of the pancreas, a particular duct in which ſeveral ſmaller ducts terminate laterally, on each ſide, like ſmall branches in a ſtem.

This canal, named ductus pancreaticus, or ductus Virtſungi, from the diſcoverer of it in the human body, is very thin, white, and almoſt tranſparent; and the extremity of the trunk opens commonly into the extremity of the ductus choledochus. From whence it diminiſhes gradually, and terminates in a point next the ſpleen. The ſmall lateral branches are likewiſe pretty large near the trunk, and very ſmall towards the edges of the pancreas, all of them lying in the ſame plane, like the branches of the common filix or fern.

The pancreatic duct is ſometimes double in man, one lying above the other. It is not always of an equal length, and ſometimes runs in a winding courſe, but always in the ſame plane; and it is nearer the lower than the upper ſide of the pancreas. It pierces the coats of the duodenum, and opens into the ductus choledochus commonly a little above the prominent point of the orifice of the canal; and ſometimes it opens immediately into the duodenum.

The arteries of the pancreas come from the pylorica duodenolis, and principally from the ſplenica, which adheres very cloſely to the whole lower ſide of the pancreas near the poſterior edge; and it ſends off in its paſſage a great many ramifications, named arteriæ pancreaticæ, which go off from each ſide more or leſs tranſverſely. It receives alſo ſome ramifications from the gaſtrica major, and meſenterica ſuperior.

The pancreatic veins are branches of the ſplenica, one of the principal branches of the vena portæ major, or ventralis. The vena ſplenica runs likewiſe along the

lower ſide of the pancreas near the edge, in a ſhallow depreſſion, formed in the ſubſtance of the gland. Theſe veins anſwer to the arteries of the ſame name; and there are likewiſe other ſmall veins, correſponding to the ſmall arteries, which are productions of the great meſaraica, &c.

The nerves of the pancreas come partly from the plexus hepaticus, partly from the plexus ſplenicus, and partly from the plexus meſentericus ſuperior; and it likewiſe receives ſome from the flat ganglion, or plexiform intertexture.

The pancreatic duct is not only double in ſome ſubjects, as has been ſaid, but the collateral branches have communications in form of iſlands, in ſeveral places within the body of the pancreas. See the article LIVER. *Winſlow.*

PANDECTS, in the civil law, collections made by Juſtinian's order, of five hundred and thirty-four deciſions of the ancient lawyers, on ſo many queſtions occurring in the civil law; to which that emperor gave the force and authority of law, by an epiſtle prefixed to them. The pandects conſiſt of fifty books, and make the firſt part of the body of the civil law.

PANDICULATION, a ſtretching, or that violent and tenſive motion of the ſolids, which uſually accompanies the act of yawning.

PANDORON, in antiquity, a muſical inſtrument, reſembling a lute, but with ſtrings of braſs; its frets were of copper, and its back flat, like the guitar.

PANEGYRIC, an oration in praiſe of ſome extraordinary thing, perſon, or virtue.

Panegyric is ranked among the demonſtrative kinds of orations, of which there are commonly reckoned two kinds, viz. the artificial, where every thing is reduced to certain heads; and the other natural, where the order of hiſtory is obſerved.

PANEGYRICUM, in church-hiſtory, an eccleſiaſtical book, uſed by the Greek church, containing the panegyrical orations of various authors, on the ſolemnities of Jeſus Chriſt and the ſaints.

PANEL, in law, ſignifies a ſchedule, or ſmall roll of parchment, in which is contained the names of the jurors returned by the ſheriff, to paſs upon trial; ſo that the impanelling of a jury is no more than the ſheriff's entering them upon his panel or roll.

PANIC denotes an ill-grounded terror or fright.

PANICUM, panic, in botany, a genus of plants, the flower of which is compoſed of two ſharp pointed valves, and incloſes the ſeed, which is ſingle and roundiſh, but ſomewhat flatted.

Panic-ſeed is accounted drying, refrigerant, and aſtringent; and therefore recommended in ſpitting of blood, and nocturnal pollutions.

PANNAGE, *Panagium*, in law-books, ſignifies the food that ſwine feed upon in woods, as maſt of beech and acorns; or money taken by the king's agiſtors, for the privilege of feeding hogs in the king's foreſt.

PANNEL, in joinery, is a typanum, or ſquare piece of thin wood, ſometimes carved, framed, or grooved in a larger piece, between two upright pieces and two croſs pieces.

PANNEL, in maſonry, is one of the faces of a hewn ſtone.

PANNELS *of a Saddle*, are two cuſhions or bolſters, filled with cows, deers, or horſe-hair, and placed under the ſaddle, on each ſide, to prevent the bows and bands from galling the horſe.

PANNICULUS CARNOSUS, in comparative anatomy, a robuſt fleſhy tunic, ſituated in beaſts, between the tunic and the fat; by means of which they can move their ſkin in whole or part: it is altogether wanting in mankind.

PANTHEA, in antiquity, ſtatues compoſed of the figures or ſymbols of ſeveral divinities.

PANTHEON, in Roman antiquity, a temple of a circular form, dedicated to all the gods: it was built by Agrippa, ſon-in-law to Auguſtus; but is now converted into a church, and dedicated to the virgin and all the martyrs.

PANTOMIME, in antiquity, a perſon who imitates all ſorts of actions and characters, by mere geſtures, without ſpeaking a word.

PAPAVER, the poppy, in botany. See the article POPPY.

PAPER, *παπυρος*, ſheets of a thin matter, made of ſome vegetable ſubſtance.

The materials on which mankind have, in different ages, contrived to write their ſentiments, have been extremely various; in the early ages they made uſe of ſtones, and tables of wood, wax, ivory, &c. See the article BOOK.

Paper, with regard to the manner of making it, and the materials employed therein, is reducible to ſeveral kinds; as Egyptian paper, made of the ruſh papyrus; bark paper, made of the inner rind of ſeveral trees; cotton paper; incombuſtible paper; and European paper, made of linen rags.

Egyptian paper was principally uſed among the ancients; being made of the papyrus, or biblus, a ſpecies of ruſh which grew on the banks of the Nile: in making it into paper, they began with lopping off the two extremes of the plant, the head and the root; the remaining part, which was the ſtem, they cut lengthwiſe into two nearly equal parts, and from each of theſe they ſtripped the ſcaly pellicles of theſe which it conſiſted. The innermoſt of theſe pellicles were looked on as the beſt, and that neareſt the rind as the worſt: they were therefore kept apart, and made to conſtitute two different ſorts of paper. As the pellicles were taken off, they extended them on a table, laying them over each other tranſverſely, ſo as that the fibres made right angles; in this ſtate they were glued together by the muddy waters of the Nile; or, when thoſe were not to be had, with paſte made of the fineſt wheat-flour, mixed with hot water and a ſprinkling of vinegar. The pellicles were next preſſed, to get out the water, then dried, and laſtly flatted and ſmoothed by beating them with a mallet: this was the Egyptian paper, which was ſometimes farther poliſhed by rubbing it with a glaſs-ball, or the like.

Bark-paper was only the inner whitiſh rind, incloſed between the bark and the wood of ſeveral trees, as the maple, plane, beech, and elm, but eſpecially the tilia, or linden-tree, which was that moſtly uſed for this purpoſe. On this, ſtripped off, flatted, and dried, the ancients wrote books, ſeveral of which are ſaid to be ſtill extant.

Chineſe paper is of various kinds; ſome is made of the rinds or barks of trees, eſpecially the mulberry-tree and elm, but chiefly of the bambu and cotton-tree. In fact, almoſt each province has its ſeveral paper. The preparations of paper made of the barks of trees, may be inſtanced in that of the bambu, which is a tree of the cane or reed-kind. The ſecond ſkin of the bark, which is ſoft and white, is ordinarily made uſe of for paper: this is beat in fair water to a pulp, which they take up in large moulds, ſo that ſome ſheets are above twelve feet in length: they are completed, by dipping them, ſheet by ſheet, in alum-water, which ſerves inſtead of the ſize among us, and not only hinders the paper from imbibing the ink, but makes it look as if varniſhed over. This paper is white, ſoft, and cloſe, without the leaſt roughneſs; though it cracks more eaſily than European paper, is very ſubject to be eaten by the worms, and its thinneſs makes it liable to be ſoon worn out.

Cotton-paper is a ſort of paper which has been in uſe upwards of ſix hundred years. In the French king's library are manuſcripts on this paper, which appear to be of the tenth century; and from the twelfth century, cotton-manuſcripts are more frequent than parchment ones. Cotton-paper is ſtill made in the Eaſt-Indies, by beating cotton-rags to a pulp.

Linnen, or European paper appears to have been firſt introduced among us towards the beginning of the fourteenth century; but by whom this valuable commodity was invented, is not known. The method of making paper of linnen or hempen-rags, is as follows: the linnen-rags being carried to the mill, are firſt ſorted; then waſhed very clean in puncheons, whoſe ſides are grated with ſtrong wires, and the bottoms bored full of holes. After this they are fermented, by laying them in heaps, cloſe covered with ſacking, till they ſweat and rot; which

which is commonly done in four or five days. When duly fermented, they are twiſted into handfuls, cut ſmall, and thrown into oval mortars, made of well ſeaſoned oak, about half a yard deep, with an iron plate at bottom, an inch thick, eight inches broad, and thirty long: in the middle is a waſhing-block, grooved, with five holes in it, and a piece of hair-ſieve faſtened on the inſide: this keeps the hammers from touching it, and prevents any thing going out except the foul water. Theſe mortars are continually ſupplied with water, by little troughs, from a ciſtern, fed by buckets fixed to the ſeveral floats of a great wheel, which raiſes the wooden hammers, for pounding the rags in the mortars. When the rags are beaten to a certain degree, called the firſt ſtuff, the pulp is removed into boxes, made like corn-chandlers bins, with the bottom-board aſlant, and a little ſeparation on the front, for the water to drain away. The pulp of the rags being in they take away as many of the front-boards as are needful, and preſs the maſs down hard with their hands: the next day they put on another board, and add more pulp, till the box is full; and here it remains mellowing a week, more or leſs, according to the weather. After this, the ſtuff is again put into clean mortars, and is beaten afreſh, and removed into boxes, as before; in which ſtate it is called the ſecond ſtuff. The maſs is beat a third time, till ſome of it being mixed with fair water, and brewed to and fro, appears like flour and water, without any lumps in it; it is then fit for the pit-mortar, where it is perfectly diſſolved, and is then carried to the vat, to be formed into ſheets of paper.

But lately, inſtead of pounding the rags to a pulp with large hammers, as above, they make uſe of an engine, which performs the work in much leſs time. This engine conſiſts of a round ſolid piece of wood, into which are faſtened ſeveral long pieces of ſteel, ground very ſharp. This is placed in a large trough with the rags, and a ſufficient quantity of water. At the bottom of the trough is a plate with ſteel bars, ground ſharp like the former; and the engine being carried round with prodigious velocity, reduces the rags to a pulp in a very ſhort time. It muſt be obſerved, that the motion of the engine cauſes the water in the trough to circulate, and by that means conſtantly returns the ſtuff to the engine. The trough is conſtantly fed with clean water at one end, while the dirty water from the rags is carried off at the other, thro' a hole, defended with wire-gratings, in order to hinder the pulp from going off with the dirty water.

When the ſtuff is ſufficiently prepared as above, it is carried to the vat, and mixed with a proper quantity of water, which they call priming the vat. The vat is rightly primed, when the liquor has ſuch a proportion of the pulp, as that the mould, on being dipped into it, will juſt take up enough to make a ſheet of paper of the thickneſs required. The mould is a kind of ſieve, exactly of the ſize of the paper to be made, and about an inch deep, the bottom being formed of fine braſs-wire, guarded underneath with ſticks, to prevent it bagging down, and to keep it horizontal; and further, to ſtrengthen the bottom, there are large wires placed in parallel lines, at equal diſtances, which form thoſe lines viſible in all white paper, when held up to the light: the mark of the paper is alſo made in this bottom, by interweaving a large wire in any particular form. This mould the maker dips into the liquor, and gives it a ſhake as he takes it out, to clear the water from the pulp. He then ſlides it along a groove to the coucher, who turns out the ſheet upon a felt, laid on a plank, and lays another felt on it; and returns the mould to the maker, who by this time has prepared a ſecond ſheet in another mould: and thus they proceed, laying alternately a ſheet and a felt, till they have made ſix quires of paper, which is called a poſt; and this they do with ſuch ſwiftneſs, that, in many ſorts of paper, two men make twenty poſts, or more in a day. A poſt of paper being made, either the maker or coucher whiſtles; on which four or five men advance, one of whom draws it under the preſs, and the reſt preſs it with great force, till all the water is ſqueezed from it; after which it is ſeparated, ſheet by ſheet, from the felts, and laid regularly one ſheet upon another; and having undergone a ſecond preſſing, it is hung up to dry. When ſufficiently dried, it is taken off the lines, rubbed ſmooth with the hands, and laid by till ſized, which is the next operation. For this they chooſe a fine temperate day, and having boiled a proper quantity of clean parchment or vellum-ſhavings, in water, till it comes to a ſize; they prepare a fine cloth, on which they ſtrew a due proportion of white vitriol and roch-allum finely powdered, and ſtrain the ſize thro' it into a large tub; in which they dip as much paper at once as they can conveniently hold, and with a quick motion give every ſheet its ſhare of the ſize, which muſt be as hot as the hand can well bear it. After this, the paper is preſſed, hung up ſheet by ſheet to dry; and being taken down, is ſorted, and what is only fit for outſide-quires, laid by themſelves: it is then told into quires, which are folded and preſſed. The broken ſheets are commonly put together, and two of the worſt quires are placed on the outſide of every ream or bundle; and being tied up in wrappers, made of the ſettling of the vat, it is fit for ſale.

Paper is of various kinds, and uſed for various purpoſes: with regard to colour, it is principally diſtinguiſhed into white, blue and brown; and with regard to its dimenſions, into atlas, elephant, imperial, ſuper-royal, royal, medium, demy, crown, fool's cap, and pot-paper.

Blotting PAPER is paper not ſized, and into which ink readily ſinks: it is uſed in books, &c. inſtead of ſand, to prevent blotting, and by chemiſts, &c. for filtrating.

Bliſtered PAPER is white paper waſhed over with a ſponge dipped in ſoot water. It is uſed by the painters in crayons to ſave labour in places which are to be ſhadowed the ſame depth of the teint of that paper. The lights are laid in with white.

Marbled PAPER. See MARBLING.

PAPER *Hangings*, furniture now greatly uſed, and generally approved, as it is at once airy and cheap.

The paper manufactured for hangings is of ſeveral kinds, ſome being made in repreſentation of ſtucco work, for the covering cielings, or the ſides of halls, ſtair-caſes, paſſages, &c. and others in imitation of velvet, damaſk, brocades, chints, or other ſuch ſilks and ſtuffs as are employed for hanging rooms. The principal difference in the manufacture lies, however, in the grounds: ſome of which are laid in varniſh, and others in the common vehicles for water colours; and in the raiſing a kind of coloured emboſſment by chopt cloth.

This emboſſed ſort is called flock-paper: the art of making which is of very late invention, and is a great improvement of the manufacture of paper hangings, both with regard to the beauty and durableneſs.

Unwrought PAPER *proper for Hangings.* — The kind of paper employed for making the paper-hangings is a ſort of coarſe cartoon manufactured for this purpoſe; and there being a particular duty on paper-hangings, it is required under conſiderable penalties to be ſtamped before it be painted, or otherwiſe decorated for this purpoſe. There is no occaſion however to be more particular in explaining the qualities of this kind of unwrought paper; becauſe it is to be had of all the great dealers in paper, manufactured in a proper manner.

Colours proper to be uſed for PAPER *Hangings.* — The colours proper to be uſed for the painting, or colouring the paper hangings, are all the kinds that can be uſed in water and varniſh. But, for common deſigns done with water only, the following are moſt proper.

For red; lake, vermilion, roſe pink, and red oker. For blue; Pruſſian blue, verditer, and indico. For yellow; the yellow berry waſh, Dutch pink, and yellow oker. For green; verdigriſe, or a mixture of the blue colours with the yellow colours, particularly with the yellow berry waſh. For orange; vermilion, or red lead, with Dutch pink. For purple; a waſh made of log-wood, or a mixture of the lake, or roſe pink, with deep coloured Pruſſian blue, or with indico. For black; lamp black, and in ſome nicer caſes ivory black. For white; whiting; and for the heightnings white lead.

Where great brightneſs is required, the lake ſhould be uſed for the crimſon red; and Pruſſian blue for the blue; but for many purpoſes roſe pink uſed alone for the crimſon red; and indico mixed with whiting for the blue; will anſwer the purpoſe with greatly leſs expence.

The lake, roſe pink, Pruſſian blue, and Dutch pink,

intended for this uſe, ſhould be had, of thoſe who make them, in a moiſt ſtate; before they have become more dry than to be of the conſiſtence of paſte. There is a double advantage in this; they ſave the trouble of levigation; and, mixing much more kindly with the vehicle than when they are dry, and to be ground afreſh, they both ſpread much farther on the work, and, lying more even, appear to be brighter.

Where hangings of more delicate deſigns, and greater value are to be painted, particularly thoſe in imitation of the India paper, carmine may be occaſionally uſed; but it muſt be laid on with the pencil, and employed ſparingly, otherwiſe it would too much enhance the expence.

The colours uſed in varniſh may be the ſame as thoſe uſed with water: but thoſe, which are above directed to be had of the makers in a moiſt ſtate, muſt for this purpoſe be had dry. Verdigriſe, and, for nicer purpoſes, the chryſtals of verdigriſe (commonly called diſtilled verdigriſe), are with advantage uſed in varniſh, though not proper to be commixt with water. A tincture of turmeric in ſpirit of wine gives a very good yellow for uſing along with the other colours in varniſh: but it muſt be uſed only on varniſhed grounds; as it will otherwiſe ſpread itſelf out of all bounds, and even run through the paper.

White and coloured Grounds for PAPER *Hangings.*—The common grounds laid in water are made by mixing whiting with the common glovers ſize, and laying it on the paper with a proper bruſh in the moſt even manner. This is all that is required, where the ground is to be left white; and the paper being then hung on a proper frame, till it be dry, is fit to be painted. When coloured grounds are required, the ſame method muſt be purſued; and the ground of whiting firſt laid, except in paler colours, ſuch as ſtraw colours or pinks, where a ſecond coating may ſometimes be ſpared, by mixing ſome ſtrong colour with the whiting.

Manner of painting the PAPER *Hangings.*—There are three methods by which paper hangings are painted: the firſt by printing on the colours; the ſecond by uſing the ſtencil, and the third by laying them on with a pencil, as in other kinds of painting.

When the colours are laid on by printing, the impreſſion is made by wooden prints; which are cut in ſuch manner, that the figure to be expreſſed is made to project from the ſurface by cutting away all the other part; and this, being charged with the colours tempered with their proper vehicle, by letting it gently down on a block on which the colour is previouſly ſpread, conveys it from thence to the ground of the paper, on which it is made to fall more forcibly by means of its weight, and the effort of the arm of the perſon who uſes the print. The manner of doing this, when more particularly explained, is thus.

The paper being properly prepared by a ground of whiting, colour, or varniſh as above explained, is laid on a proper block, on which a piece of leather is ſtrained: and the print being cut in ſuch manner, correſpondently to the deſign of the painting, that there ſhall be a projection on the ſurface anſwering to every part, where that colour intended to be conveyed by this print is neceſſary, the colour mixt with its proper vehicle is ſpread on a piece of leather, or oil cloth, laid on a flat block, ſomewhat larger than the print: which is done by a boy or man, who attends for that purpoſe; and having the colour by him, in a pot, ſpreads it with a bruſh on the block betwixt every ſtroke and impreſſion the printer makes. He then takes the print either in his right-hand, or, when too heavy to be ſo managed, in both, and drops it gently on the block, juſt charged with colour; from whence he again immediately raiſes it in the moſt perpendicular direction, and lets it fall in the ſtrongeſt, tho' moſt even manner he can on the paper; increaſing the force by all the additional velocity he can give the print. When this is done, the ſheet printed is immediately taken off the block, and hung up to dry; and another being put in its place, the ſame operation is repeated, till the whole quantity of paper be printed. It is eaſy to conclude that there muſt be as many ſeparate prints, as there are colours to be printed; and they are to be uſed ſucceſſively in the ſame manner as the firſt. But where there are more than one, great care muſt be taken, after the firſt, to let the print fall exactly in the ſame part of the paper, as that which went before; otherwiſe the figure of the deſign would be brought into irregularity and confuſion. In common paper of low price it is uſual, therefore, to print only the outlines, and lay on the reſt of the colours by ſtencilling; which both ſaves the expence of cutting more prints; and can be practiſed by common workmen, not requiring the great care and dexterity neceſſary to the uſing ſeveral prints.

The manner of ſtencilling the colours is this. The figure, which all the parts of any particular colour make in the deſign to be painted, is to be cut out, in a piece of thin leather, or oil cloth; which pieces of leather, or oil cloth, are called ſtencils; and being laid flat on the ſheets of paper to be printed, ſpread on a table or floor, are to be rubbed over with the colour properly tempered, by means of a large bruſh. The colour paſſing over the whole is conſequently ſpread on thoſe parts of the paper where the cloth or leather is cut away; and give the ſame effect, as if laid on by a print. This is nevertheleſs only practicable without great care in parts where there are only detached maſſes, or ſpots of colours: for where there are ſmall continued lines, or parts that run one into another, it is difficult to preſerve the connection or continuity of the parts of the cloth, or to keep the ſmaller corners cloſe down to the paper; and therefore, in ſuch caſes, prints are preferable. Stencilling is indeed a cheaper method of ridding coarſe work than printing: but without ſuch extraordinary attention and trouble, as render it equally difficult with printing, it is far leſs beautiful and exact in the effect. For the out-line of the ſpots of colour want that ſharpneſs and regularity that are given by prints; beſides the frequent extralineations, or deviations from the juſt figure, which happen by the original miſplacing of the ſtencils, or the ſhifting the place of them during the operation.

Pencilling is only uſed in the caſe of nicer work, ſuch as the better imitations of the India paper. It is performed in the ſame manner as other paintings in water, or varniſh. It is ſometimes uſed only to fill the outlines already formed by printing; where the price of the colour, or the exactneſs of the manner in which it is required to be laid on, render the ſtencilling or printing it leſs proper; at other times it is uſed for forming or delineating ſome parts of the deſign, where a ſpirit of freedom and variety, not to be had in printed outlines, are deſired to be had in the work.

The manner of proceeding with theſe ſeveral methods is, in common work, to ſtencil firſt all parts of each colour in the deſign; and to give an outline to the whole at laſt, by printing with brown or black; but where there is any running part of the deſigns, ſuch as ſcrolls, or the ſtems of creeping plants, or flowers, which are to be printed in any other colour than brown or black, a print muſt be uſed for them; though, if they require only brown or black, they may be done by the ſame print which makes the outlines.

In the finer paper, where ſeveral colours are laid on with the prints, the principal colour is begun with; and the reſt taken ſucceſſively; the print for the outline being laid on laſt. In caſes where the pencil is to be uſed, the outlines is nevertheleſs to be made before the colours are laid on by the pencil, if ſuch outline is to be made at all; becauſe that is the guide to the perſons who lay on the colour, and confines them to a correctneſs.

In paper printed with deſigns in chiaro oſcuro, ſuch as the imitation of ſtucco work, and baſs relieves, the order of printing muſt be, to lay on the ground colour firſt; afterwards the ſhades; and laſtly the lights: and the ſame rule of ſucceſſion ſhould be obſerved where the colours are pencilled.

The colours for painted grounds in common work are principally laid on, as was before mentioned, with ſize, and a ſmall proportion of gum arabic or ſenegal; with which, being properly diſſolved in water, the colours of a dry nature are to be ground in hand or horſe mills: but the moiſt colours may be mixt with them, by means of a ſtrong bruſh only; being put together in proper pots, and well ſtirred about.

Management of the Flock PAPER.—The paper deſigned for

for receiving the flock is generally firſt prepared with a varniſh ground; for as the flock itſelf requires to be laid on with varniſh, the other kind of ground would prevent it from taking on the paper; and render the coheſion ſo imperfect, that the flock would peel off with the leaſt violence. The ground muſt, therefore, either be varniſh with ſome proper colour, or be that of the paper itſelf; but if, nevertheleſs, for cheapneſs, as was at firſt practiſed, the ground be deſired to be laid on with water, ſuch ground muſt be laid by the ſtencil; by which means the part where the varniſh is to be laid for receiving the flock, muſt be kept intirely free from the matter of which the ground is formed. Inſtead of the oil of turpentine varniſh, a compoſition of drying oil and reſin, to which ſome gum ſanderac may be added, might be uſed with advantage, with reſpect to the expence: but the brownneſs of this mixture is injurious, where the brightneſs of the colour of the flock is of any moment; and it is likewiſe ſomewhat more incommodious in the uſing, on account of its drying much ſlower.

It is frequently practiſed to print ſome moſaic, or other ſmall running figure in colours, on the ground, before the flock be laid on; and it may be done with any pigment of the colour deſired, tempered in varniſh, and laid on by a print cut correſpondently to that end.

The manner of laying on the flock is, either by means of a print, or by a ſtencil; but as the ſtencil can execute nothing but detached parts; and conſequently is unfit for all deſigns where running work, ſcrolls, or other more complicated ornaments are introduced; it is extremely confined with reſpect to the nature of the deſigns, for which it can be employed; and the print is, therefore, moſt generally preferred. The method of laying on the flock by means of a print is this. A wooden print being cut as is above deſcribed for laying on the colour in ſuch manner, that the part of the deſign, which is intended for the flock, may project beyond the reſt of the ſurface, the varniſh is put on a block covered with leather, or oil cloth, in the ſame way as was before directed for the colours; and the print is to be uſed alſo in the ſame manner, to lay the varniſh on all the parts where the flock is to be fixed. The ſheet, thus prepared by the varniſhed impreſſion, is then to be removed to another block or table; and to be ſtrewed over with flock; which is afterwards to be gently compreſſed by a board, or ſome other flat body, to make the varniſh take the better hold of it: and then the ſheet is to be hung on a frame till the varniſh be perfectly dry; at which time the ſuperfluous part of the flock is to be bruſhed off by a ſoft camel's hair bruſh; and the proper flock will be found to adhere in a very ſtrong manner. When the ſtencil is uſed, the ſame method is to be perſued: the varniſh for holding the flock being laid on by that, inſtead of a print; and the flock afterwards ſtrewed upon it, as in the other caſe.

The uſual method of preparing the flock is, by cutting woollen rags, or pieces of cloth with the hand, by means of a large bill or chopping knife: but it is much more eaſily and better done, by a machine, which may be worked by a horſe-mill, at the ſame time ſuch mill is employed for cutting diamonds, or any other ſimilar purpoſe. In ſuch caſe, the conſtruction of that part of the machine, which is made for the cutting the flock, is this:

A box is made for containing the rags or cloth to be cut, which is open at the top, and of ſuch ſize as may beſt ſuit the quantity of rags that the force employed can cut. A blade is alſo to be made, the length of which is to be equal to the breadth of the box; and it ſhould be ſtrong; and muſt be charged with as great a weight as the force employed can be made to raiſe with a quick motion. The box, being filled with the rags or cloth to be cut, is placed under the blade, and made to move, by hitches, after the ſtroke of the blade is given, juſt ſo far as where it is proper the blade ſhould again cut the cloth or rags; while, at the ſame time, the blade is lifted up, and let fall on the cloth, which it cuts through, till by ſucceſſive ſtrokes, and the progreſſive motion of the box under it, the whole quantity of cloth or rags in the box has been cut. The box muſt then be turned, ſo that one of the ſides may become the front; and the operation muſt be repeated; by which means the cloth or rags, having been cut both ways, will be reduced to the ſtate in which the matter is called flock, and fit to be employed for the purpoſe of paper hangings. The work neceſſary for conveying from the principal mover in the mill, the motion for thruſting forwards the box, and raiſing the blade, may be eaſily ſupplied by any ingenious wheelwright; and need not therefore be particularly deſcribed here.

There is a kind of counterfeit flock-paper, which, when well managed, has very much the ſame effect to the eye as the real, though done with leſs expence. The manner of making this ſort is, by laying a ground of varniſh on the paper; and having afterwards printed the deſign of the flock in varniſh, in the ſame manner as for the true; inſtead of the flock, ſome pigment, or dry colour, of the ſame hue with the flock required by the deſign, but ſomewhat of a darker ſhade, being well powdered, is ſtrewed on the printed varniſh; and produces nearly the ſame appearance.

PAPIER *Maché* is paper reduced to the conſiſtence of a pulp by boiling and beating.

When this pulp is of a proper conſiſtence, it is caſt in a moiſt ſtate in proper moulds: and having been previouſly mixed with ſome gummous, or other adheſive body, will acquire ſo conſiderable a degree of tenacity and hardneſs, as to retain the figure, and anſwer the end of wood turned, or carved, or plaſter caſt into the ſame form.

The paper uſed for making the papier maché may be of any kind, according to the nicety required in the work to which it is applied. For very coarſe purpoſes, brown may be employed; and for the moſt nice, writing paper is beſt: and it is not very material, whether the paper be clean or foul, or whether it be written or printed upon, or blank: except where it might be intended to be only moulded, and not coloured, or varniſhed afterwards; which is ſeldom the caſe.

The gum or adheſive body uſed for giving the due texture to the papier maché may be gum-arabic, glue, or iſinglaſs: but for common purpoſes, gum-arabic, or glue are uſed, iſinglaſs being too dear, and indeed gum-arabic has an advantage over either of the other, of not ſhrinking near ſo much in drying.

The preparation of the papier maché may be as follows. "Take any quantity of paper; and boil it in water, ſtirring it about with a wooden ſpatula, till it become of a paſty ſubſtance; and appear to have loſt its coheſion. Pour off then the water from it; and beat it in a mortar, or ſuch kind of machine as will have the ſame effect, till it be a perfectly ſoft and yielding pulp. Prepare, in the mean time, a ſtrong gum water, by diſſolving gum arabic in water; and having preſſed the greateſt part of the water out of the pulp, add the gum water to it in ſuch proportion, that they may produce together the conſiſtence of a thick fluid. Put them then into a proper veſſel; and boil them ſlowly, till they form a paſte of the right conſiſtence for caſting." The papier maché will then be ready prepared for working with the proper moulds: but the ſtiffneſs of the paſte may be varied with advantage, according to the nature of the work. That intended for pieces where the figure is ſimple, and has no ſharp or emboſſed work, requiring to be ſtiffer; while the emboſſed work, or other ſuch as has relieved parts, ſhould be thinner. The uſing glue or ſize, inſtead of gum arabic, makes a ſaving; and will anſwer extremely well in the caſe of boxes, or any other pieces of a ſimple or flat form; becauſe the ſhrinking may be allowed for in the figure of the moulds: but for emboſſed work, or deſigns where ſeveral parts muſt be joined together, the uſe of gum-arabic will be found more expedient; as the relative proportions will be much better preſerved.

The moulds in which the papier maché is caſt may be either of plaſter of Paris, or wood. For emboſſed work, or deſigns of a more complex kind, plaſter is preferable: but for boxes, cups, or ſimpler forms, the moulds may be beſt of wood; as ſuch will laſt for a long time, and not require renewing ſo often, from the unavoidable wear, or the injury of a ſlight accidental violence, as thoſe made of plaſter. But in the choice of moulds, and ſubjects to which they are applied, regard ſhould be had to the figure, with reſpect to its roundneſs, or projecting parts: for,

embossed work or frames of any kind, where there are a variety of angles on one side, and a flat plainness on the other, are most expediently managed in plaster: and where there are nice joints, as in the case of boxes, or where the figure must be preserved on both sides, wood is much more proper. The plaster moulds for casting the papier maché must be made in the same manner, as those for casting in plaster. See CASTING.

But it is peculiarly necessary in casting the papier maché to grease the moulds extremely well; otherwise there will be a cohesion betwixt the matter cast and the moulds, that will be destructive to both. Where any subject cast is of considerable extension and one side of it a blank reverse, as in the case of bass reliefs, and other ornaments of that nature, it is usual to lay slips of whole strong paper over the papier maché: such paper being first well moistened with gum water, or strong size, which is rather better in this case. This not only makes a saving, but is really an advantage to the work, as it adds greatly to the strength and tenacity; and more especially preserves it, during the time of its drying, from the injuries of slighter violence: to answer this end more effectually, the paper itself applied to this purpose should, however, be very strong; and where the nature of the subject admits of it, laid on several times doubled.

The wooden moulds, which are the most proper sort for forming boxes, cups, or flat pieces of any kind, where there is no embossed work, must be made in two parts; or, more explicitly, there must be a convex part and a concave part; betwixt which a space must be allowed for the figure of the subject, that is to be cast. These may be best made of box, or other hard wood turned into the proper figure: and it is expedient to have two or three small perforations, or holes, through the substance of the wood of the concave part near the middle, to let out the fluid when the papier maché is compressed to give it the due form. The hollow betwixt the convex and concave parts of the mould may be about a seventh or eighth part of an inch thick, in the case of snuff or dressing boxes, or other pieces of the like magnitude; but it may be enlarged when bigger subjects come in question. The moulds when first used should be well greased, and placed before a fire, that they may imbibe as much as possible of the grease; which will render the oiling them afterwards, each time they are employed, more effectual.

When the moulds are prepared, the surface of the concave or hollow part must be spread all over with the paste, as evenly as possible; and as nearly as can be judged, of the thickness of the hollow betwixt the two parts; and then the cover or solid part of the mould must be put over the paste; and compressed till it be in its proper place. The cast being thus made, it must be suffered to remain in the mould till it gain a sufficient strength and tenacity of parts, by drying, to be able to maintain its form when taken out; and then, being freed from both parts of the mould, it must be dried, and afterwards varnished or painted, according to the purpose for which it is designed.

PAPILIO, the butterfly, in zoology, a numerous genus of four winged insects, distinguished by clavated antennæ.

The number of butterflies is so great, that authors commonly divide them into classes, or subdivisions, according to the number of their legs; some having six, and others only four legs; under each of which are comprehended a multitude of beautiful species, distinguished by the different colours and variegations of their wings.

PAPILIONACEOUS, among botanists, an appellation given to the flowers of certain plants, from their resembling the figure of a butterfly; they consist of four petals, whereof that which covers the others is called the vexillum; the two petals placed on each side are called the alæ or the wings; and the lowest petal is termed the carina, which is often divided into two portions.

PAPILLA, in anatomy, is a name given to the nipple of the breast, and also to the small eminences of the skin and tongue.

PAR, in commerce, implies any two things equal in value; and, in money affairs, it is so much as a person must give of one kind of specie, to render it just equivalent to a certain quantity of another.

PARABLE, a fable, or allegorical instruction, founded on something real or apparent, in nature or history, from which a moral is drawn, by comparing it with something in which the hearers are more immediately concerned.

PARABOLA, in geometry, a figure arising from the section of a cone, when cut by a plane parallel to one of its sides. See CONIC *Section*.

From the same point of a cone, therefore, only one parabola can be drawn: all the other sections within these parallels being ellipses; and all without hyperbolas.

To describe a parabola by a continual motion. — Let the straight rule GR (plate XCVII. *fig.* 6.) be fixed on a plane, then take another rule as RDC right-angled at D, and let its side DC slide along GK, take a string equal in length to the side RD, and fix one end of it in any point of the plane as in F, and the other end at R the extremity of the rule, then while DC slides along GK, keep by a pin P, the string RPF constantly as close DR as may be so that it may be always straight, the pin at P will by this motion describe the curve PAQ of a parabola.

The line GK is called the directrix, or director, and the point F the focus of the parabola.

From this description it may easily be seen that the distance of any point of the parabola from the focus, is equal to the perpendicular let fall from that point on the directrix; that is, FP=PD: consequently when D comes to B; then P must fall in A, whence AF=AB.

Properties of the PARABOLA. — The square of any ordinate is equal to the rectangle of the abscissa, and four times the distance of the focus from the vertex, that is $PM^2 = AM \times 4AF$. For $PF^2 = PM^2 + FM^2$, but PF=PD=BM; then $BM^2 = PM^2 + MF^2 = FF^2 + 4AM \times AF$ (Eu. 8. 2.); therefore $PM^2 = AM \times 4AF$.

When the point *m* falls between the vertex A and focus F, then $\overline{Bm}^2 = (\overline{Fp}^2 =) \overline{Fm}^2 + \overline{mp}^2$; also $Bm^2 = 4AF \times Am + \overline{Fm}^2$; whence $4AF \times Am = \overline{mp}^2$.

Let AF=*a*, AM or Am=*x*, PM or *pm*=*y*; then $4ax = yy$, the equation of the parabola, wherein 4*a* is called the *latus rectum*, or right parameter of the parabola.

To draw a tangent to any point of the parabola as P. Take AT=AM, or FT=FP, draw TP, it will be the tangent required.

The perpendicular on the tangent, from the focus, is a mean proportional between the distance from the vertex to the focus, and the distance of the focus from the point of contact; or AF : EF :: EF : FP. For the angles AFE and EPF are equal; and the angles EAF, FMP, PEF, are each right; therefore the triangles EAF, EPF, are similar; whence AF : EF :: EF : FP.

All lines within the parabola which are drawn parallel to the axis, are called diameters. Thus PI (*fig.* 7.) parallel to the axis AM is a diameter; and ordinates to those diameters are right lines, drawn parallel to the tangents at the vertices of those diameters. Thus OI is an ordinate to the diameter PI.

The parameter of any diameter is a right-line, such that the product under the same, and the abscissa, is equal to the square of the semi-ordinate.

If PI be a diameter, and BD an ordinate to the axis AD, then $PI \times 4AF = BI \times IC$. For $4AF \times AD = \overline{BD}^2 = DC^2$, and $4AF + AM = \overline{PM}^2$; therefore $\overline{AD - AM} \times 4AF = \overline{BD}^2 - \overline{MP}^2 = \overline{BD + MP} \times BD = MP = IC \times BI$. But AD−AM=MD=PI; whence $PI \times 4AF = BI \times IC$.

Every ordinate is bisected by its diameter; that is, if EG (*fig.* 8.) be a diameter, and AB an ordinate, AG will be equal to GB. For draw AI and BK perpendicular to the directrix IK. On A, as a center with the distance AI, describe a circle, and it will pass through the focus C; because AC=AI. Draw FC, which continue till it again cuts the circle in M, and join BC, BM. Now because AB is parallel to PQ, the angle ALC=ENF (Eu. 29. 1.); but ENF is a right angle; therefore CL=LM, and BC=BM=BK; consequently, if a circle be described upon the center B, with the distance BK, it will pass through the points C and M. Let the circle be described; then IK is a tangent

to both the circles ICM, KCM (Eu. 3. 18.); and conſequently MF×FC=IF²=FK² (Eu. 3, 36.); whence IF=FK. But IF : FK :: AG : GB (Eu. 6. 2.); therefore AG=GB.

The ſquares of all ordinates to the ſame diameter are to one another as their abſciſſas. Let BI (*fig.* 9) be a diameter, and CE, DG, ordinates to the ſame; then will $EC^2 : GD^2 :: BE : BG$. For let fall the perpendicular CH, DI; then CE will be parallel to DG, and the angle CEH=DGI; and by reaſon of the right angles CHE, DIG; the triangles CHE, DIG, are ſimilar; whence CH : DI :: CE : DG; and $\overline{CH}^2 : DI^2 :: \overline{CE}^2 : \overline{DG}^2$; but BE×*p* (*p* being put for the parameter) $=CH^2$, and BG×*p*=DI^2; therefore BE : BG :: $CE^2 : DG^2$.

The parameter (P) of any diameter BI is equal to four times the intercepted abſciſſa AL, together with the parameter (*p*) of the axis; that is, P=4AL+*p*. Draw the ordinate AE, then AE=BT, and BE=TA=AL. But BE×P=AE^2, or AL×P=$(\overline{BT}^2 = \overline{BL}^2 + \overline{LT}^2) = AL \times p + 4\overline{AL}^2$. Therefore P=*p*+4AL.

If a tangent be drawn to any point of the parabola as E (*fig.* 10.) meeting the diameter PI produced in Q, and if through the ſame point E be drawn EI an ordinate to that diameter, then PQ=PI. For draw PO perpendicular to the axis AFC; draw ECK, AB and M, parallel to PO and from P drawn the tangent PHS. The triangles POH, GEC, are ſimilar; therefore $\overline{PO}^2 : \overline{GE}^2 :: \overline{OH}^2 : \overline{GC}^2$; but $\overline{PO}^2 : \overline{GE}^2 :: OH : MG$. Hence $\overline{OH}^2 \times MG = OH \times GC^2$, or $MG \times OH = \overline{GC}^2$. Again, from the ſimilar triangles LQM, GME, we have $\overline{PO}^2 : GE^2 :: \overline{QL}^2 : \overline{MG}^2$; but $\overline{PO}^2 : \overline{GE}^2 :: OH : MG$; therefore $\overline{QL}^2 : \overline{MG}^2 :: OH : MG$; and conſequently $QL^2 \times MG = MG^2 \times OH$, or $\overline{QL}^2 = MG \times OH$. It has already been proved that $\overline{CG}^2 = MG \times OH$; hence GC=QL. Now GC+AG+AH=PI, and QL+AG+AO (AH)=PQ; therefore PI=PQ.

Carteſian PARABOLA is a curve of the ſecond order, expreſſed by the equation $xy = ax^3 + bx^2 + cx + d$, containing four infinite legs, viz. two hyperbolic ones, MM, B*m* (*fig.* 11.) AE being the aſymptote, tending contrary ways, and two parallel legs BN, MN, joining them, being the 66th ſpecies of lines of the third order, according to Sir Iſaac Newton, called by him a trident, and is made uſe of by Des Cartes, in the third book of his Geometry, for finding the roots of equations of ſix dimenſions by its interſections with a circle. Its moſt ſimple equation is $xy = x^3 + a^3$, and the points thro' which it is to paſs may be eaſily found by means of a common parabola, whoſe abſciſſa is $ax^2 + bx + c$, and an hyperbola whoſe abſciſſa is $\frac{d}{x}$; for *y* will be equal to the ſum or difference of the correſpondent ordinates of this parabola and hyperbola.

Diverging PARABOLA, a name given by Sir Iſaac Newton to five different lines of the third order, expreſſed by the equation $yy = ax^3 + bx^2 + cx + d$.

PARABOLIC *Conoid*, a ſolid figure generated by the rotation of a parabola about its axis. Its ſolidity is half that of its circumſcribing cylinder, being made up of a ſeries of circles in arithmetical proportion, whoſe number of terms is expreſſed by the axis of the conoid, firſt term 0, and laſt term the area of the baſe.

A parabolic conoid is to a cylinder of the ſame baſe and height as 1 to 2, and to a cone of the ſame baſe and height as 1 $\frac{1}{2}$ to 1, or as 3 to 2.

PARABOLIC *Cuneus*, a ſolid figure formed by multiplying the ſum of all the DB's by DS (pl. XCVII. *fig.* 12.) and is equal to a priſm, whoſe ends are ſimilar and equal triangles, each being in area equal to APB, and its altitude equal to AS.

PARABOLIC *Pyramidoid*, a ſolid figure generated by ſuppoſing all the ſquares of the ordinates applicates in the parabola ſo placed, as the axis ſhall paſs through all the centers at right angles; in which caſe, the aggregate of the planes will form the parabolic pyramidoid.

The ſolidity hereof is had by multiplying the baſe by half the altitude; the reaſon of which is obvious; for the component planes being a ſeries of arithmetical proportionals beginning from 0, their ſum will be equal to the extremes multiplied by half the number of terms.

PARABOLIC *Space*, the area contained between any entire ordinate and the curve of the incumbent parabola.

Segment of a PARABOLIC *Space* is that ſpace included between two ordinates.

PARABOLIC *Spindle*, a ſolid formed by the revolution of a parabola about an ordinate rightly applied. This ſolid is eight fifteenths of its circumſcribing cylinder.

PARABOLOIDES, in geometry, parabolas of the higher kind; the general equation of theſe curves is $p^{m-1} \times x^{m-1} = y^m$, wherein *m* may be expounded by any number (greater than 1) at pleaſure.

PARACENTESIS, in ſurgery, implies an operation, commonly called tapping, which is performed in the following manner.

The patient being laid on the ſide of his bed, the trocar is to be inſerted into the lower and lateral part of the cavity of the abdomen, at about eight fingers breadth from the navel, or in the middle of the ſpace between the navel and the angle of the os ilium, and after drawing out the ſharp pointed bodkin from the cannula, which is left in the wound, ſo much of the water may be drawn off at a time as the patient can well bear; and if the patient does not grow faint, the whole quantity may be drawn off at once. In order to keep him from fainting, the ſurgeon, or his aſſiſtant, muſt preſs both his hands on each ſide of the abdomen during the operation; or a broad linnen ſwath perforated in the middle, may be put round the abdomen, and gradually drawn tighter till all the water is evacuated; after which a flannel-compreſs, dipped in ſpirits of wine, may be placed on the wound, and retained by a tight roller. If the patient can only bear to have a few pounds of water taken at a time, as the wound is but ſmall and almoſt cloſes of itſelf, it may be dreſſed only with a couple of ſquare compreſſes, a plaſter and bandage; and if his ſtrength will permit, the operation may be repeated the next day on the other ſide of the abdomen; and ſo on the third day, about two fingers-breadth from the laſt perforation: freſh wounds are made, rather than to keep open the firſt, becauſe wounds kept open in hydropical ſubjects, are in danger of mortifying.

In a paracenteſis of the thorax, to diſcharge water, blood, matter, or ſuch other preternatural ſubſtances as are there lodged, it is neceſſary to conſider, before the operation, in which ſide of the thorax the matter is contained, and what part of that cavity is moſt proper to be perforated. In order to diſcover the firſt, the ſurgeon ſhould learn in which ſide the patient has before had any pain or inflammation; in what part he perceives the weight and fluctuation of matter; on which ſide he can lie eaſier than on the other: for that is uſually the ſide affected; the perſon not being able to lie on the ſound ſide, becauſe of the weight or preſſure of the matter on the mediaſtinum; and, laſtly, he may generally perceive ſome tumour, or inflammatory heat on the ſide affected. Having diſcovered which ſide of the thorax is to be perforated, the operation may then be ſafely performed between the ſecond and third of the ſpurious ribs on the left ſide, or between the third and fourth on the right ſide, counting from below upwards, ſo as to be about five or ſix fingers-breadth from the ſpine of the back, and as much below the angle of the ſcapula. The ſurgeon having marked the deſcribed place with ink, and taken up the integuments between his own fingers and thoſe of an aſſiſtant, as in cutting iſſues, he makes an inciſion about two inches long, according to the courſe of the ribs; then cautiouſly divides the intercoſtal muſcles and pleura by a tranſverſe inciſion with the ſcalpel; and having introduced the cannula, the contained humours of the thorax are thereby diſcharged. During the operation the patient ſhould be retained in an inclined poſture, by which means the ribs will be elevated more from each other, and a large ſpace made for the inciſion; and a ſufficient opening being made in the thorax, the finger is then to be introduced, in order to ſeparate the lungs from its adheſions to the pleura, and to make way for the peccant humours.

mours. After theſe are diſcharged, the orifice of the wound is to be ſtopped with a piece of ſoft linnen-rag rolled up, by which it may be kept open for future diſcharges; but over the orifice of the wound is to be applied ſoft lint, faſtened with thread, and over that a plaſter, compreſs and bandage. The dreſſing may afterwards be made once or twice a day, diſcharging and waſhing out the matter by injecting a decoction of vulnerary herbs. Theſe injections ſhould be continued till they are obſerved to return clean, and unmixed with bloody or purulent matter, which is a ſign the parts are healed; on which the convoluted linnen-rag and lint may be withdrawn, and the reſt of the cure completed, as directed under wounds of the thorax. For the method of performing a paracenteſis of the ſcrotum, ſee the article HYDROCELE.

PARACENTRIC *Motion*, in aſtronomy, implies the quantity which a revolving planet approaches nearer to, or recedes from the ſun, or center of attraction.

PARACLET, the comforter, a name given the Holy-Ghoſt.

PARADE, the placing any thing to public view, with all its advantages and ornaments.

PARADE, in war, is a place where the troops meet to go upon guard, or any other ſervice.

PARADE, in fencing, implies the action of parrying, or turning off any thruſt.

PARADISE, a term principally uſed for the garden of Eden, in which Adam and Eve were placed immediately upon their creation.

As to this terreſtrial paradiſe, there have been many enquiries about its ſituation. It has been placed in the third heaven, in the orb of the moon, in the moon itſelf, in the middle region of the air, above the earth, under the earth, in the place poſſeſſed by the Caſpian ſea, and under the arctic pole. The learned Huetius places it upon the river produced by the conjunction of the Tigris and Euphrates, now called the river of the Arabs, between this conjunction and the diviſion made by the ſame river before it falls into the Perſian ſea. Other geographers have placed it in Armenia, between the ſources of the Tigris, the Euphrates, the Araxis, and the Phaſis, which they ſuppoſe to be the four rivers deſcribed by Moſes.

The celeſtial paradiſe is that place of pure and refined delight, in which the ſouls of the bleſſed enjoy everlaſting happineſs. In this ſenſe it is frequently uſed in the New Teſtament: our Saviour tells the penitent thief on the croſs, "This day ſhalt thou be with me in paradiſe." and St. Paul ſpeaking of himſelf in the third perſon ſays, "I knew a man who was caught up into paradiſe, and heard unſpeakable words, which is not lawful for a man to utter."

Mahomet has promiſed his followers a paradiſe of mere ſenſual delights.

Bird of PARADISE, *Paradiſæa*, in ornithology, a genus of birds of the order of the picæ, the beak of which is a cultrato-ſubulated form, and acute; the forehead is gibbous, and the two middle feathers are extremely long, and very firm.

Of this genus there are a great many elegant ſpecies.

PARADOX, in philoſophy, a propoſition ſeemingly abſurd, as being contrary to ſome received opinion; but yet true in fact.

No ſcience abounds more with paradoxes than geometry: that the right line ſhould continually approach to the hyperbola, and yet never reach it, is a true paradox; and in the ſame manner, a ſpiral may continually approach to a point, and yet not reach it, in any number of revolutions, however great.

PARAGOGE, in grammar, a figure whereby a letter is added to the end of a word.

PARAGRAPH implies a ſection or diviſion of a chapter, and in references is marked thus, ¶.

PARALEPSIS, in rhetoric, the pretence of paſſing over ſomething, and yet mentioning it by the bye.

PARALIPOMA, a ſupplement of things omitted in a preceding work.

PARALLACTIC, ſomething relating to the parallax of the heavenly bodies. See PARALLAX.

PARALLAX, *Parallaxis*, in aſtronomy, is a change of the apparent place of any heavenly object in the ſphere of heaven, cauſed by its being ſeen from different points of view.

The word is Greek, and derived from παραλλαττω, to vary or change.

Let A B D (plate XCVII. *fig.* 13.) be the earth, *p*, z, O, part of the ſphere of the heaven; now though we are ſure, by geometrical reaſoning, that if two ſtraight lines were to be drawn from any two different points of the ſurface of the earth, as A and B, to the center of the ſun, or any of the planets at H, they would form an angle A H B; and if they were prolonged from thence to the ſphere of the heaven, they would croſs one another, and terminate in two points thereof, N and O, which would be at ſome diſtance from one another; yet this diſtance, for the moſt part, is too ſmall to be taken by any inſtrument: this diſtance between the points N and O is called the parallax, which is ſaid to be ſenſible, when great enough to be diſcoverable by obſervation; inſenſible, when too ſmall to be meaſured by any inſtrument.

The diurnal parallax of a phænomenon, which is generally underſtood, when the word is uſed without any epithet, is the arch of a great circle in the ſphere of the heaven, contained between the point wherein it appears to a ſpectator upon the ſurface of the earth, and the point wherein it would appear, if it were viewed by a ſpectator at the center of the earth: the former of theſe points is called the apparent place, the latter the true place of the phænomenon: it is called diurnal parallax, to diſtinguiſh it from the annual; and becauſe it ariſes from the ſemidiameter of the earth, whoſe revolution round her axis cauſes the viciſſitude of day and night; or becauſe it is alterable by the diurnal rotation of the earth, which changes the apparent altitudes of the heavenly bodies, and conſequently their parallax.

A phænomenon, which at different altitudes continues at the ſame diſtance from the center of the earth, has the greater parallax the farther it appears from the zenith of the obſerver, therefore the parallax is greateſt in the horizon. A phænomenon that appears in the zenith, whatever its diſtance from the earth is, has no parallax: thus, if a phænomenon be at H (plate XCVII. *fig.* 14.) in the viſible horizon of a ſpectator at A, its parallax is the arc N O; its apparent place is O, its true place N: if it be at ſome height above the horizon, as at G, its parallax is L M, which is leſs than N O: if it be higher, as at F, its parallax is I K, leſs than L M: if it be at E or *e*, it appears in the zenith at Z, and has then no parallax; for the lines A Z and C Z coinciding, its apparent place is the ſame with its true place.

Parallax always diminiſhes the altitude of a phænomenon, or makes it appear lower than it would do from the center of the earth: thus O, the apparent place of H, is farther from the zenith Z than its true place N is; in like manner, M, the apparent place of G, is lower than its true place L; and K, the apparent place of F, is lower than its true place I. The change of the altitude by parallax may, according to the different ſituation of the ecliptic and equator in reſpect of the horizon of the ſpectator, cauſe an apparent parallax or change of the latitude, longitude, declination, and right aſcenſion, of the phænomenon; it may change only ſome of them: thus (*fig.* 15.) let HO be the horizon, EC part of the ecliptic, P the pole of the ecliptic, Z the zenith, Z V an arc of a vertical drawn through I the true place, and F the apparent place of a planet; let P B be a circle of latitude drawn through the planet's true place, and P A a circle of latitude drawn through its apparent place; it is manifeſt that the parallax of altitude F I, by changing of the planet from I to F, alters its latitude from B I to A F; it alters its longitude alſo, as much as the arc A B amounts to. If the place of a planet be in a vertical circle which cuts the ecliptic in the 90th degree from the interſection of the horizon and ecliptic, that is, which cuts the ecliptic at right angles, the parallax will change the latitude of the planet, but not its longitude: thus, if a planet be in the point K of the vertical Z E H, this vertical being perpendicular to the ecliptic, and conſequently a circle of latitude, by the definition the parallax of altitude K L will be the ſame with the parallax of latitude; but ſince the

the ſame circle of latitude P E H paſſes through the true place K, and the apparent place L, the parallax of altitude K L does not change the longitude. Let E C, which before repreſented the ecliptic, be now the equator, P the pole of the equator, P E H the meridian, P I B a circle of declination paſſing through the true place, and P F A a circle of declination paſſing through the apparent place of the planet, the point B ſhews the true, and the point A the apparent right aſcenſion of the planet, and B A is the parallax of right aſcenſion: I B it is true, F A its apparent declination, and their difference is the parallax of declination: if the ſtar be in the meridian, as at K, the parallax of declination will be K L, the ſame as the parallax of altitude; but there will be no parallax of right aſcenſion, becauſe the ſame circle of declination P E H paſſes through the apparent place L, and the true place K.

The parallaxes of any two phænomena, as *f* and *h*, (*fig.* 16.) whoſe diſtances from the center of the earth are different, and apparent diſtances from the zenith equal, are nearly reciprocally as their diſtances from the center of the earth: thus, if the diſtance of *h* from C be double the diſtance of *f* from C, the parallax of *f* will be double the parallax of *h*. The converſe of this is true, if the parallax of *f* be double the parallax of *h*, the diſtance of *h* is double the diſtance of *f* from the earth.

One uſe of the knowledge of parallaxes is to find the true place of a phænomenon: in all obſervations of the heavenly bodies, it is neceſſary to know how much they are depreſſed by the parallax, that, by adding ſo much to their apparent, we may have their true altitudes: indeed, in all of them, except the moon, the parallax is ſo ſmall, that, in moſt caſes, we need not take any account of it; but then to know it to be thus ſmall is of good uſe, to prevent our falling into the miſtakes, and help us to correct the obſervations of thoſe who have ſuppoſed it too great; as all aſtronomers, till of late, have done: thus, Ptolemy ſettled the horizontal parallax of the ſun, when in perigee, about 3′; as Tycho did alſo: Kepler diminiſhed it to 1′; but, by the lateſt and beſt obſervations, it is found not to exceed 10″.

Another uſe of parallaxes is to find the diſtance of the heavenly bodies from the earth: thus, the horizontal parallax of any one of them being known, its diſtance from the earth may be found. The parallax of a phænomenon at any given altitude being known, its diſtance from the earth may be found.

The moon being the neareſt to the earth of all the heavenly bodies, her parallax is the greateſt, and, conſequently, the moſt eaſy to be determined; it amounts to about a whole degree.

The ſun, and all the primary planets, except Mars and Venus when in perigee, are at ſo great diſtances from the earth, that their parallax is too ſmall to be obſerved. When Mars is in oppoſition to the ſun, his diſtance from the earth is but half ſo much as the ſun's diſtance from the earth; and, conſequently, his parallax is then double to that of the ſun: Tycho, in the year 1582, endeavoured, with incredible diligence, to diſcover the parallax of Mars in oppoſition; but Kepler, having examined Tycho's obſervations, concluded from them, that Mar's parallax was ſcarcely ſenſible.

The horizontal parallax of a phænomenon would be found directly, if it were to be ſeen by two obſervers, diſtant from each other 90° of a great circle upon the earth, and ſo ſituated, that one of them had the phænomenon in his zenith, the other in his horizon: the diſtance between the two points in the ſphere of the heaven in which the phænomenon appeared to them, would be its parallax (*fig.* 17.) let a phænomenon be at H, to an obſerver at B it appears in the zenith at N; to one at A it appears in his horizon at O; its horizontal parallax is N O. This method is mentioned for the eaſineſs of conceiving it, but is not likely to be put in practice; and if it were, horizontal obſervations are very uncertain, by reaſon of the variableneſs of refraction in or near the horizon: but, the parallax of a phænomenon at any known altitude being found, its horizontal parallax may be computed from thence, by a very eaſy proceſs. Alſo, if two obſervers, not ſo far diſtant as 90 degrees, obſerve, at the ſame time, meridian altitudes of a phænomenon, the difference of declination which comes out from thoſe altitudes, is the parallax owing to the difference of latitude of the places of obſervation; this being known, the horizontal parallax, which would ariſe from a diſtance of 90° may be computed from it: thus the meridian altitudes of Mars, in perigee, were obſerved at the ſame time at Paris by Caſſini, and at Cayenne by Richer; and the horizontal parallax of Mars computed from thence: the beſt way to have found the parallax of Mars, by obſervations made at theſe two places, would have been to have obſerved, with the teleſcope, an occultation of ſome fixed ſtar by Mars; if this had appeared exactly the ſame in both places, it would have ſhewn that Mars had no ſenſible parallax; if he had, the moment that the upper edge of Mars' diſk appeared at Paris to touch the ſtar, it would at Cayenne have appeared a little higher than the ſtar: and theſe diſtances of Mars from the ſtar ſeen in one place, and not in the other, would have been owing to the parallax. As they had not an opportunity of making ſuch an obſervation in both places at the ſame time, they took the ſame day, at Paris and Cayenne, meridian altitudes of Mars, and of a fixed ſtar in Aquarius, nearly of the ſame declination as that planet then had, in order to find whether the difference between the altitudes of Mars and that ſtar were the ſame at Cayenne as at Paris; if it were, ſince the ſtar has no parallax, the declination of Mars would come out the ſame from the obſervations in both places, and his parallax would be inſenſible; if, on the contrary, the difference between the altitudes of Mars and of the ſtar were obſerved to be greater at one place than at the other, this would ſhew a difference between the declination of Mars, as calculated from the obſervations of him in one place, and his declination, as it came out from the obſervations in the other place; which difference would be the parallax of Mars, ariſing from his being viewed by two obſervers diſtant from each other, as much as the arc of a great circle contained between the parallels of Paris and Cayenne amounts to. And they found it equal to 25″ $\frac{1}{3}$.

Annual PARALLAX of a phænomenon, is the change of its apparent place in the ſphere of the heaven, which is cauſed by its being viewed from the earth in different parts of her orbit: the annual parallax of all the planets is conſiderable, but that of the fixed ſtars is inſenſible. See ABERRATION.

PARALLAX, in levelling, denotes the angle contained between the line of true level and that of apparent level.

PARALLEL, in geometry, is applied to lines, figures, and bodies, every where equidiſtant from each other, and which, though infinitely produced, would never meet; thus, the line O P (pl. XCVII. *fig.* 18.) is parallel to Q R.

Parallel lines ſtand oppoſed to lines converging and diverging. Geometricians demonſtrate, that if two parallels O P and Q R (*fig.* 19.) be cut by a tranſverſe line S T in A and B; 1. The alternate angles *x* and *y* are equal. 2. The external angle *u* is equal to the internal oppoſite one *y*; and, 3dly, the two internal oppoſite ones *x* and *y* are alſo equal to two right angles.

It is ſhewn on the principles of optics, that if the eye be placed between two parallel lines, they will appear to converge towards a point oppoſite to the eye. And if they run to ſuch a length, as that the diſtance between them be but as a point thereto, they will there appear to coincide.

Parallel lines are deſcribed by letting fall equal perpendiculars, and drawing lines through the extremes.

PARALLEL *Planes* are ſuch planes as have all the perpendiculars drawn betwixt them equal to each other.

PARALLEL *Rays*, in optics, are thoſe which keep at an equal diſtance from the viſible object to the eye, which is ſuppoſed to be infinitely remote from the object.

PARALLEL *Ruler*, or *Parallelifm*, an inſtrument conſiſting of two wooden, braſs, &c. rulers A B, C D, (*fig.* 20.) equally broad every where, and ſo joined together by the croſs blades E F and G H, as to open at different intervals, accede and recede, and yet ſtill retain their parallelifm.

The uſe of this inſtrument is obvious; for one of the rulers being applied to R S, and the other withdrawn to a given point V, a right angle A B, drawn by its edge through V, is a parallel to R S.

PARALLELS, or PARALLEL *Circles*, in geography, called alſo parallels or circles of latitude, are leſſer circles

of

of the ſphere conceived to be drawn from weſt to eaſt through all the points of the meridian, commencing from the equator to which they are parallel, and terminating with the poles.

They are called parallels of latitude, becauſe all places lying under the ſame parallel, have the ſame latitude.

PARALLELS *of Latitude*, in aſtronomy, are leſſer circles of the ſphere parallel to the ecliptic, imagined to paſs through every degree and minute of the colures.

They are repreſented on the globe by the diviſions on the quadrant of altitude, in its motion round the globe, when ſcrewed over the pole of the ecliptic. See the article GLOBE.

PARALLELS *of Altitude*, or *Almacantars*, are circles parallel to the horizon, imagined to paſs through every degree and minute of the meridian between the horizon and zenith, having their poles in the zenith.

They are repreſented on the globe by the diviſions on the quadrant of altitude, in its motion about the body of the globe, when ſcrewed to the zenith.

PARALLELS *of Declination*, in aſtronomy, are the ſame with parallels of latitude in geography.

PARALLEL *Sphere*, that ſituation of the ſphere wherein the equator coincides with the horizon, and the poles with the zenith and nadir. Conſequently the poles of the world become the poles of the horizon.

In this ſphere all the parallels of the equator become parallels of the horizon, conſequently no ſtars ever riſe or ſet, but all turn round in circles parallel to the horizon; and the ſun, when in the equinoctial, wheels round the horizon the whole day. After his riſing to the elevated pole, he never ſets for ſix months; and after his entering again on the other ſide of the line, never riſes for ſix months longer.

This is the poſition of the ſphere to ſuch as live under the poles, and to whom the ſun is never above 23° 30′ high.

PARALLEL *Sailing*, in navigation, is the ſailing under a parallel of latitude. See *Parallel* SAILING.

PARALLELEPIPED, or PARALLELOPIPED, in geometry, a regular ſolid, comprehended under ſix parallelograms, the oppoſite ones whereof are ſimilar, parallel, and equal.

All parallelepipeds, priſms, cylinders, &c. whoſe baſes and heights are equal, are themſelves equal.

A diagonal plane divides a parallelepiped into two equal priſms; ſo that a triangular priſm is half a parallelepiped upon the ſame baſe, and of the ſame altitude.

All parallelepipeds, priſms, cylinders, &c. are in a ratio compounded of their baſes and altitudes: wherefore, if their baſes be equal, they are in proportion to their altitudes; and converſely.

All ſimilar parallelepipeds, cylinders, cones, &c. are in a triplicate ratio of their homologous ſides, and alſo of their altitudes.

Equal parallelepipeds, priſms, cones, cylinders, &c. reciprocate their baſes and altitudes.

To meaſure the ſurface and ſolidity of a parallelepiped. Find the areas of the parallelograms ILMK, LMON, and OMKP (plate XCVIII. *fig.* 1.) add theſe into one ſum, and multiply that ſum by 2, the factum will be the ſurface of the parallelepiped.

If then the baſe ILMK be multiplied by the altitude MO, the product will be the ſolidity.

PARALLELISM, the ſituation or quality whereby any thing is denominated parallel.

PARALLELISM *of the Earth's Axis*, in aſtronomy, that ſituation of the earth's axis, in its progreſs through its orbit, whereby it is ſtill directed towards the pole-ſtar; ſo that if a line be drawn parallel to its axis, while in any one poſition, the axis, in all other poſitions, will be always parallel to the ſame line.

This parallelism is the neceſſary reſult of the earth's double motion, namely, round the ſun, and its own axis. And to it we owe the viciſſitudes of ſeaſons, and the inequality of day and night.

PARALLELISM *of the Rows of Trees*.—Theſe are never ſeen parallel, but always inclining to each other towards the farther extreme.

Hence mathematicians have taken occaſion to enquire in what lines the trees muſt be diſpoſed to correct this effect of the perſpective, and make the rows ſtill appear parallel. The two rows muſt be ſuch, as that the unequal intervals of any two oppoſite or correſpondent trees may be ſeen under equal viſual rays.

On this principle, ſome have ſhewn that the two rows of trees muſt be two oppoſite ſemi-hyperbolas.

M. Varignon, in Mem. de l'Acad. ann. 1717, renders the problem much more general, and requires not only that the viſual angles be equal, but to have them increaſe or decreaſe in any given ratio, provided the greateſt do not exceed a right angle. The eye requires to be placed in any point, either juſt at the beginning of the ranges, beyond or on this ſide.

He ſuppoſes the firſt row to be a right line, and ſeeks what line the other muſt be, which he calls the curve of the range: this he finds muſt be an hyperbola to have the viſual angles equal. The ſtraight and hyperbolical rows will be ſeen parallel to infinity; and if the oppoſite ſemi-hyperbola be added, we ſhall have three rows of trees, the ſtraight one in the middle, and all three parallel.

It is ſufficient that this ſecond hyperbola have the ſame center, its vertex in the ſame right line, and the ſame conjugate axis. Thus the two hyperbolas may be of all the different kinds poſſible, yet all have the ſame effect.

If it be required to have the trees appear under decreaſing angles, the ſtraight row being laid down as before, he ſhews, that if the decreaſe be in a certain ratio, the other line muſt be a parallel ſtraight line. But he goes yet farther, and ſuppoſing the firſt row any curve whatever, he ſeeks for another that ſhall make the rows have any effect deſired.

PARALLELOGRAM, in geometry, a quadrilateral right-lined figure, whoſe oppoſite ſides are parallel and equal to each other. It is generated by the equable motion of a right line always parallel to itſelf. When it has all its four angles right, and only its oppoſite ſides equal, it is called a rectangle or oblong. When the angles are all right, and the ſides equal, it is called a ſquare. If all the ſides be equal, and the angles unequal, it is called a rhombus or lozenge: and if the ſides and angles be unequal, it is called a rhomboides.

Properties of the PARALLELOGRAM.—In every parallelogram of what kind ſoever, as ABCD (p. XCVIII. *fig.* 2.) a diagonal DA divides it into two equal parts; the angles diagonally oppoſite B, C, and A, D, are equal; the oppoſite angles of the ſame ſide C, D, and A, B, &c. are together equal to two right angles; and each two ſides, together, greater than the diagonal.

Two parallelograms ABCD, and ECDF, on the ſame or equal baſe CD, and of the ſame height AC, or between the ſame parallels AF, CD, are equal: and hence two triangles CDA, and CDF, on the ſame baſe and of the ſame height, are alſo equal. Hence, alſo, every triangle CFD is half a parallelogram ACDB upon the ſame or an equal baſe CD, and of the ſame altitude, or between the ſame parallels. Hence, alſo, a triangle is equal to a parallelogram, having the ſame baſe and half the altitude, or half the baſe and the ſame altitude.

Parallelograms, therefore, are in a given ratio compounded of their baſes and altitudes. If then the altitudes be equal, they are as the baſes, and converſely.

In ſimilar parallelograms and triangles, the altitudes are proportional to the homologous ſides, and the baſes are cut proportionably thereby. Hence ſimilar parallelograms and triangles are in a duplicate ratio of their homologous ſides; as alſo of their altitudes, and the ſegments of their baſes; they are, therefore, as the ſquares of the ſides, altitudes, and homologous ſegments of the baſes.

In every parallelogram, the ſum of the ſquares of the two diagonals is equal to the ſum of the ſquares of the four ſides. For if the parallelogram be rectangular, it follows, that the two diagonals are equal; and conſequently the ſquare of a diagonal, or, which comes to the ſame thing, the ſquare of the hypothenuſe of a right angle, is equal to the ſquares of the ſides.

If the parallelogram be not rectangular, and of conſe-

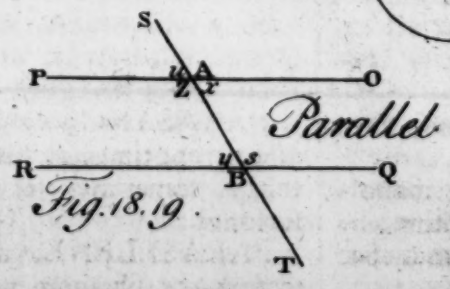

Fig. 20.

quence the two diagonals unequal, which is the moſt general caſe, the propoſition becomes of vaſt extent; for inſtance, in the whole theory of compound motions, &c. There are ſeveral ways of demonſtrating this problem, the analytical method is ſhewn by Sir Iſaac Newton, in his Univerſal Arithmetic. The trigonometrical is as follows: Let ABCDA (*fig.* 3.) be an oblique parallelogram, whoſe diagonals are AC, BD; then by lemma 1, (Clark's Introduction to Mechanics), the ſum of the ſquares of AB and BC, together with a double rectangle of thoſe ſides, drawn into the coſine of the angle ABC (radius being 1), is equal to the ſquare of the diagonal AC. In like manner, $\overline{BC}^2+\overline{CD}^2-2BC\times CD\times$ coſine of the angle $BCD=\overline{BD}^2$. But the angles ABC, BCD, are ſupplemental to each other; therefore their coſines are equal, conſequently $2BC^2+2CD^2=\overline{AC}^2+\overline{BD}^2$.

If a geometrical demonſtration be required, it may be thus.—From B draw BF, making the angle AFB = ABC, draw BE = BF. From C draw CH, making the angle CHD=BCD, produce BD, and draw CG =CH. From the ſimilar triangles ABF, ABC, we have AB : AF :: AC : AB; whence $\overline{AB}^2=AF\times FC$; and from the ſimilar triangles ABC, BEC, we get BC :CE :: AC : BC; therefore $\overline{BC}^2=AC\times CE$. $\therefore \overline{AB}^2+\overline{BC}^2=AF\times AC+CE\times AC=\overline{AC}^2-AC\times EF$. Again, by the ſimilar triangles BCD, HCD, we have BD :CD :: CD : HD; and by the ſimilar triangles BCG, BCD, there will ariſe BC : DB :: BG : BC. From this and the former proportion we get $\overline{BC}^2=BD\times BG$, and $\overline{CD}^2=BD\times HD$; conſequently $\overline{BC}^2+\overline{CD}^2=\overline{BG+HD}\times BD=\overline{BD}^2+HG\times BD=\overline{AC}^2-AC\times EF$. The iſoſceles triangles FBE, HCG, are ſimilar; therefore HG : FE :: AC : BD $\therefore HG\times BD=FE\times AC$; and conſequently $2\overline{AB}^2+2\overline{BC}^2=\overline{AC}^2+\overline{BD}^2$.

To find the area of a rectangled parallelogram, multiply the length ſuppoſed = 354 in the breadth = 132, the product will be the area of the parallelogram; namely, 46728. Hence, 1. Rectangles are in a ratio compounded of their ſides. 2. If, therefore, three right lines be continually proportional, the ſquare of the middle one is equal to the rectangle of the two extremes; and if four right lines be proportional, the rectangle under the two extremes is equal to that under the two middle terms.

Other parallelograms, not rectangular, have their areas found by reſolving them, by diagonals, into two triangles, and adding the areas of the ſeparate triangles into one ſum.

PARALLELOGRAM, or PARALLELISM, a machine for the ready reduction of deſigns; it is the ſame with the pentagraph. See the article PENTAGRAPH.

PARALOGISM, in logic, a falſe reaſoning, or a fault committed in demonſtration, when a conſequence is drawn from principles that are falſe; or, though true, are not proved; or when a propoſition is paſſed over that ſhould have been proved by the way.

A paralogiſm differs from a ſophiſm in this, that the ſophiſm is committed out of deſign and ſubtlety, and the paralogiſm out of miſtake and for want of ſufficient light and application. See the articles SOPHISM and DEMONSTRATION.

PARALYSIS, the palſy. See PALSY.

PARALYTIC, a perſon afflicted with the palſy. See PALSY.

PARAMESE, in the ancient muſic, the note above the meſe, in the Greek ſcale; correſponding to a la-mire, of Guido's ſcale. See DIAGRAM.

PARAMETER, in conic ſections, a conſtant line; otherwiſe called latus rectum when applied to the principal axis of the figure. See the articles ELLIPSIS, HYPERBOLA, and PARABOLA.

PARAMOUNT, in law ſignifies the ſupreme lord of the fee. See FEE.

The lords of theſe honours or manors that have manors under them are ſtiled lords paramount; and the king, by our law is the chief lord of all the lands in England. See MANOR.

PARAPET, in fortification, an elevation of earth deſigned for covering the ſoldiers from the enemies cannon or ſmall ſhot. The thickneſs of the parapet is from eighteen to twenty feet; its height is ſix feet on the inſide, and four or five on the outſide. It is raiſed on the rampart, and has a ſlope above called the ſuperior talus, and ſometimes the glacis of the parapet. The exterior talus of the parapet is the ſlope facing the country: there is a banquette or two for the ſoldiers, who defend the parapet to mount upon, that they may the better diſcover the country, foſſe, and counterſcarpe, and fire as they find occaſion. See the articles GLACIS, TALUS, BANQUETTE, &c.

Parapet of the covert way, or corridor, is what covers that way from the ſight of the enemy, which renders it the moſt dangerous place for the beſiegers, becauſe of the neighbourhood of the faces, flanks, and curtins of the place.

PARAPET is alſo a little wall raiſed breaſt high on the banks of bridges, keys, or high buildings, to ſerve as a ſtay, and prevent people's falling over.

PARAPHERNALIA, or PARAPHERNA, in the civil law, thoſe goods which a wife brings her huſband beſides her dower, and which are ſtill to remain at her diſpoſal excluſive of her huſband, unleſs there are ſome proviſion made to the contrary in the marriage contract.

PARAPHIMOSIS, in medicine, a diſorder of the penis, wherein the prepuce is ſhrunk, and withdrawn behind the glans, ſo as not to be capable of being brought to cover the ſame; which generally happens in venereal diſorders.

The cure of a paraphimoſis, according to Heiſter, conſiſts chiefly in returning the contracted prepuce over the naked glans; but as a violent inflammation is uſually the chief cauſe of its being ſo difficult to return the prepuce in the paraphimoſis, it may be firſt proper to make uſe of diſcutient and emollient fomentations or cataplaſms, with camphorated ſpirit of wine before the prepuce is attempted to be drawn over the glans, which being effected, all the other bad ſymptoms will vaniſh of courſe. However, ſome ſurgeons prefer the uſe of cold water, becauſe the former remedies often augment the influx of the blood to the parts, and ſo increaſe the tumor. But when the penis, ſcrotum, and lower part of the abdomen, are immerged in cold water, with plentiful bleeding, the tumor generally ſubſides in a ſhort time: the penis is then to be held between the ſurgeon's two foremoſt fingers of each hand; and the glans, having been firſt lubricated with oil or butter, is to be forcibly preſſed back with his thumbs, whilſt the prepuce is at the ſame time drawn forward under his fingers, ſo as to cover the denudated glands; but when the inflammation is not very large, it may be often ſufficient only to bathe the parts in water, when there is little or no virulency. On the contrary, when the tumefied penis tends to mortify through the violence of the inflammation, or long continuance of the diſorder, it will be moſt adviſable to bleed the patient firſt in the arm, and then in the vena dorſalis penis, in which laſt it ſhould be continued till the tumor ſubſides, and then the prepuce may be drawn over the glands as before.

PARAPHRASE, παραφρασις, an explanation of ſome text, in clearer and more ample terms, whereby is ſupplied what the author might have ſaid or thought on the ſubject; ſuch are eſteemed Eraſmus's paraphraſe on the New Teſtament, the Chaldee paraphraſe on the Pentateuch, &c.

PARAPHRENITIS, in medicine, an inflammation of the diaphragm.

PARAPHROSYNE, a word uſed by medical writers to expreſs a delirium, or an alienation of mind in fevers, or from whatever cauſe.

PARAPLEGIA, or PARAPLEXIA, in medicine, a ſpecies of paralyſis, or palſy, uſually ſucceeding an apoplexy. See PALSY.

PARASANG, an ancient Perſian meaſure, different at different times, and in different places; being ſometimes thirty, ſometimes forty, and ſometimes fifty ſtadia, or furlongs.

PARASELENE, in phyſiology, a mock moon, a meteor, or phænomenon, encompaſſing, or adjacent to, the

the moon, in form of a luminous ring; wherein are ſometimes obſerved one, ſometimes two, apparent images of the moon.

The paraſelones are formed after the name manner as the parhelia, or mock ſuns. See the article PARHELIUM.

PARASITES, or PARASITICAL PLANTS, in botany, ſuch plants as are produced out of the trunk or branches of other plants, from whence they receive their nouriſhment, and will not grow upon the ground, as the miſleto, &c.

PARASTATA, in the ancient architecture, an impoſt, or kind of anta, or pilaſter, built for the ſupport of an arch; or as ſome will have it, pilaſters, which ſtand alone, not adjoining to the wall. Daviler makes a paraſtata the ſame with impoſt, but Evelyn the ſame with pilaſter.

PARASTATÆ, or EPIDIDYMIDES, in anatomy, two tuberous varicoſe bodies, lying upon, and adhering to, the upper part of the teſticles, whereof they properly appear to be a part, though different from the reſt in form and conſiſtence.

The paraſtatæ are oblong, nearly of a cylindric figure, reſembling in ſome meaſure the body of a caterpillar, or ſilk-worm. They are connected with the teſticle by means of the tunica albuginea, and alſo with the vas deferens.

PARASYNANCHE, in medicine, a kind of angina, or quinzy, wherein the exterior muſcles of the throat are inflamed. See QUINZY.

PARATHENAR, in anatomy, the name of two muſcles of the foot; one of which, the parathenar major, is a pretty long muſcle, forming a part of the outer edge of the ſole of the foot. It is fixed backward by a fleſhy body to the outer-part of the lower-ſide of the os calcis, from the ſmall poſterior external tuberoſity, all the way to the anterior tuberoſity; there it joins the metatarſus, and at the baſis of the fifth metatarſal bone ſeparates from it again, and forms a tendon which is inſerted in the outſide of the firſt phalanx of the little toe, near its baſis, and near the inſertion of the other parathenar: this laſt is called the parathenar minor; being a fleſhy muſcle fixed along the poſterior half of the fifth bone of the metatarſus, and terminating under the head of that bone in a tendon which is inſerted in the lower part of the baſis of the firſt phalanx of the little toe.

PARATHESIS, in grammar, the ſame with appoſition. See APPOSITION.

PARATHESIS is alſo the ſame with parentheſis. See PARENTHESIS.

PARATITLES, *Paratitla*, in juriſprudence, ſhort notes or ſummaries of the titles of the digeſt and code; which have been made by ſeveral lawyers, in order to compare and examine the connection of the ſeveral parts with one another. See the articles DIGEST and CODE.

PARAVAIL, or PARAVAILE, ſignifies a perſon that is tenant to one who holds of another, or the loweſt tenant of the fee.

PARCÆ, in the heathen mythology, goddeſſes who were ſuppoſed to preſide over the accidents and events, and to determine the date or period of human life.

The ancients reckoned the parcæ, who were alſo called fates and deſtinies, to be three in number, becauſe all things have their beginning, progreſs, and end. They were called Atropos, Clotho, and Lacheſis, and are repreſented as ſpinning the thread of human life, in which employment Clotho held the diſtaff. Lacheſis turned the wheel, and Atropos cut the thread. Their perſons are variouſly deſcribed; ſometimes they are repreſented as old women, one holding a diſtaff, another a wheel, and a third a pair of ſciſſars. Others paint Clotho in a robe of divers colours, with a crown of ſtars upon her head, and holding a diſtaff in her hand; Lacheſis in a garment covered with ſtars, and holding ſeveral ſpindles; and Atropos they clad in black, cutting the thread with a large pair of ſciſſars.

PARCHMENT, in commerce, the ſkins of ſheep or goats prepared after ſuch a manner as to render it proper for writing upon, covering books, &c.

The manufacture of parchment is begun by the ſkinner, and finiſhed by the parchment-maker.

The ſkin having been ſtripped of its wool, and placed in the lime-pit, in the manner deſcribed under the article SHAMMY, the ſkinner ſtretches it on a kind of frame, and pares off the fleſh with an iron inſtrument; this done, it is moiſtened with a rag, and powdered chalk being ſpread over it, the ſkinner takes a large pumice-ſtone, flat at bottom, and rubs over the ſkin, and thus ſcowers off the fleſh; he then goes over it again with the iron inſtrument, moiſtens it as before, and rubs it again with the pumice-ſtone without any chalk underneath: this ſmooths and ſoftens the fleſh ſide very conſiderably. He then drains it again, by paſſing over it the iron inſtrument as before. The fleſh ſide being thus drained, by ſcraping off the moiſture, he in the ſame manner paſſes the iron over the wool or hair ſide; then ſtretches it tight on a frame, and ſcrapes the fleſh ſide again; this finiſhes its draining; and the more it is drained, the whiter it becomes. The ſkinner now throws on more chalk, ſweeping it over with a piece of lamb-ſkin that has the wool on, and this ſmooths it ſtill farther. It is now left to dry, and when dried, taken off the frame by cutting it all round. The ſkin thus far prepared by the ſkinner, is taken out of his hands by the parchment-maker, who firſt, while it is dry, pares it on a ſummer, which is a calf-ſkin ſtretched in a frame, with a ſharper inſtrument than that uſed by the ſkinner, and working with the arm from the top to the bottom of the ſkin, takes away about one half of its thickneſs. The ſkin thus equally pared on the fleſh ſide, is again rendered ſmooth, by being rubbed with the pumice-ſtone, on a bench covered with a ſack ſtuffed with flocks, which leaves the parchment in a condition fit for writing upon. The parings, thus taken off the leather, are uſed in making glue, ſize, &c. See GLUE, &c.

What is called vellum, is only parchment made of the ſkins of abortives, or at leaſt ſucking calves. This has a much finer grain, and is whiter and ſmoother than parchment; but is prepared in the ſame manner, except its not being paſſed through the lime-pit.

PARDALUS, or PARDUS, the leopard. See LEOPARD.

PARDON, in law, is the forgiveneſs of an offence againſt the king or the laws.

PAREGORICS, in pharmacy, medicines that aſſuage pain, otherwiſe called anodynes. See the article ANODYNES.

PARELCON, in grammar, a figure by which a word or ſyllable is added to the end of another.

PARENCHYMA, in anatomy, a term introduced by Eraſiſtratus, ſignifying all that ſubſtance which is contained in the interſtices betwixt the blood-veſſels of the viſcera, which he imagined to be extravaſated and concreted blood. The moderns having diſcovered all the viſcera to be vaſculary and glandulous, have rejected this term, together with the doctrine.

PARENCHYMA *of Plants*. Grew applies the term parenchyma to the pith or pulp, or that inner part of a fruit or plant through which the juice is ſuppoſed to be diſtributed. This, when viewed with a microſcope, appears to reſemble marrow, or rather a ſponge, being a porous, flexible, dilatable ſubſtance. Its pores are innumerable and exceedingly ſmall, receiving as much humour as is requiſite to fill and extend them, which diſpoſition of pores it is that is ſuppoſed to fit the plant for vegetation and growth.

PARENT, *Parens*, a term of relation applicable to thoſe from whom we immediately receive our being.

PARENTHESIS, in grammar, certain intercalary words, inſerted in a diſcourſe, which interrupt the ſenſe, or thread, but ſeem neceſſary for the better underſtanding of the ſubject.

The proper characteriſtic of a parentheſis is, that it may be either taken in or left out, the ſenſe and the grammar remaining intire. In ſpeaking, the parentheſis is to be pronounced in a different tone; and in writing, it is encloſed between ( ), called alſo a parentheſis, but commonly a bracket, or crotchet, to diſtinguiſh it from the reſt of the diſcourſe. The politeſt of our modern writers avoid all parentheſes, as keeping the mind in ſuſpenſe, embaraſſing it, and rendering the diſcourſe leſs clear, uniform, and agreeable.

PARERGA, *παρεργα*, a term ſometimes uſed in architecture for additions or appendages made, by way of ornament, to a principal work.

PARESIS, *παρεσις*, in medicine, is defined to be a palſy of the bladder, wherein the urine is either ſuppreſſed or diſcharged involuntarily.

PARGET, in natural hiſtory, a name given to ſeveral kinds of gypſum, or plaſter-ſtone. See the article PLASTER.

PARGETING, in building, is uſed for the plaſtering of walls, and ſometimes for the plaſter itſelf.

PARHELIUM, or PARHELION, in phyſiology, a mock ſun, or meteor, in form of a very bright light, appearing on one ſide of the ſun.

The prahelia are formed by the reflection of the ſun's beams on a cloud properly poſited. They uſually accompany the coronæ, or luminous circles; and are placed in the ſame circumference and at the ſame height. Their colours reſemble that of the rainbow, the red and yellow are on the ſide towards the ſun, and the blue and violet on the other. There are coronæ ſometimes ſeen without parhelia, and *vice verſa*.

Parhelia are double, tripple, &c. and in 1629, a parhelion of five ſuns was ſeen at Rome; and 1666, another at Arles of ſix.

M. Mariotte accounts for parhelia from an infinity of little particles of ice floating in the air, that multiply the image of the ſun by refraction or reflection; and by a geometrical calculus he has determined the preciſe figure of theſe little icicles, their ſituation in the air, and the ſize of the coronæ or circles which accompany the parhelia, and the colours wherewith they are painted. M. Huygens accounts for the formation of a parhelion in the ſame manner as for that of the halo. See the article HALO.

PARIETALIA OSSA, in anatomy, the ſecond and third bones of the cranium; being called alſo oſſa-bregmatis, and oſſa-ſincipitis.

PARIETES, in anatomy, a term uſed for the incloſures, or membranes, that ſtop up or cloſe the hollow parts of the body, eſpecially thoſe of the heart, thorax, &c.

PARIETARIA, pellitory of the wall, in botany, a plant with tender reddiſh ſtalks; rough, uncut, oblong leaves, pointed at both ends; and imperfect rough flowers, growing in cluſters along the ſtalks, followed each by a ſmall ſhining ſeed. It is perennial, common on old walls and among rubbiſh, and flowers in May.

The leaves of pellitory of the wall have been uſed in cataplaſms for diſcuſſing inflammatory ſwellings: decoctions of them, and their expreſſed juice, have been given as emollient diuretics, in nephritic caſes and iſchuries; and are ſaid, when long perſiſted on, to be uſeful aperients or ſweeteners in cutaneous defedations. The plant appears to be of no great activity, being rather oleraceous than medicinal: to the taſte, the leaves in ſubſtance and thin juice, are little other than herbaceous and watery.

PARISH, the precinct of a parochial church, or a circuit of ground inhabited by people who belong to one church, and are under the particular charge of its miniſter.

In England there are nine thouſand, nine hundred and thirteen pariſhes, of which three thouſand, eight hundred and forty-five are churches impropriate, and the reſt are annexed to colleges, or church dignities. In many of theſe pariſhes, on account of their large extent, and the number of pariſhioners, there are ſeveral chapels of eaſe.

PARISH-OFFICERS, officers choſen annually to regulate and manage the concerns of the pariſh, for which ſee the articles CHURCH-WARDENS and OVERSEERS *of the Poor*.

PARK, a large incloſure privileged for wild beaſts of chace, either by preſcription or the king's grant. No perſon can now erect a park without his obtaining firſt a licence under the broad-ſeal; but there may be ſuch in reputation, though erected without lawful warrant, and the owner may bring his action againſt perſons that kill his deer therein.

PARK is alſo uſed for a moveable incloſure, or fold, ſet up in the fields for ſheep to feed and reſt in during the night. This park is frequently removed by the ſhepherds to dung the ground one part after another.

PARK alſo ſignifies a large net, placed on the brink of the ſea, with only one entrance, which is next the ſhore, and which is left dry by the ebb of the tide; ſo that the fiſh once got in have no way left to eſcape.

PARK *of Artillery*. See ARTILLERY-PARK.

PARK *of Proviſions*. See *Park of* PROVISIONS.

PARLEY, a conference with an enemy. Hence to beat or ſound a parley, is to give a ſignal for holding ſuch a conference by beat of drum or ſound of trumpet.

PARLIAMENT is the grand aſſembly of the three ſtates of this kingdom, ſummoned together, by the king's authority, to conſult of matters relating to the public welfare, and particularly to enact and repeal laws. It conſiſts of the king, the lords ſpiritual and temporal, and the commons, and is at once the ſeat of the legiſlative authority, and the higheſt court of juſtice in Great-Britain. In the houſe of lords, criminal cauſes are tried on the impeachment of the commons; and this houſe has an original juriſdiction for the trial of peers upon indictments found by a grand jury; the lords likewiſe try ſuch cauſes as come thither on appeals from the court of chancery, and all their decrees are as judgments. The houſe of commons examine the right of elections, regulate diſputes concerning them, may expel their own members, and commit them to priſon; they are the grand inqueſt of the nation, and preſent public grievances or delinquents to the king and lords, in order to their being puniſhed. In ſhort, they are the repreſentatives of all the commons in the kingdom, and in them their conſtituents have placed the higheſt confidence, by inveſting them with the power of making laws, and entruſting them with all their liberties and privileges. Originally, new parliaments were called every year; but by degrees their term grew longer. In the reign of king Charles II. they were held a long time, with great interruptions between; but both methods were found of ſuch ill conſequence, that, in the beginning of the reign of king William III. an act was paſſed, by which the term of all parliaments was reſtrained to three ſeſſions, or three years; this was hence called the triennial act: but ſince that time, from other views, the period of parliaments has been lengthened to ſeven years. A parliament is called by the king's writ or letter directed to each lord, commanding him to appear; and by others writs, directed to the ſheriffs of each county, to ſummon the people to elect two knights for each county, and one or two burgeſſes for each borough. The number of the members in the houſe of lords is uncertain, as increaſing at the king's pleaſure. The members of the houſe of commons, when full, are five hundred and fifty three, viz. ninety-two knights of the ſhires; fifty-two deputies for twenty-five cities, London having four, ſixteen for the eight Cinque-ports; two for each univerſity; three hundred and thirty-two for an hundred and eighty boroughs; twelve for the boroughs in Wales, and forty-five members for Scotland. If three hundred of theſe members are met, it is reckoned a full houſe; and forty may compoſe a houſe for the diſpatch of buſineſs.

Upon the holding of a parliament, the king, the firſt day, ſits in the upper houſe, under a canopy, with the crown on his head, and dreſſed in his royal robes; and there, by himſelf, or the lord chancellor, declares the reaſons of their meeting, in the preſence of both the lords and commons; and then the commons are required to chooſe a ſpeaker, who is preſented to the king, and being approved by his majeſty, the buſineſs of the parliament goes on.

The lords and commons ſit each in a diſtinct apartment: in the houſe of lords, the princes of the blood ſit by themſelves on the ſides of the throne; at the wall, on the king's right hand, the two archbiſhops ſit by themſelves on a form. Below them, the biſhops of London, Durham, and Wincheſter, and all the other biſhops ſit according to the priority of their conſecration. On the king's left hand, the lord treaſurer, lord preſident, and lord privy-ſeal ſit upon forms above all dukes, marquiſſes, and earls, according to their creation. Acroſs the room are wool-ſacks, continued from an ancient cuſtom; and

the

the chancellor, or keeper, being of courſe the ſpeaker of the houſe of lords, ſit on the firſt wool-ſack before the throne, with the great ſeal or mace lying by him; below theſe are forms for the viſcounts and barons. On the other wool-ſacks are ſeated the judges, maſters in chancery, and king's counſel, who are only to give their advice in points of law: but they all ſtand up till the king gives them leave to ſit. The commons ſit promiſcuouſly, only the ſpeaker has a chair at the upper end of the houſe, and the clerk and his aſſiſtant ſit at a table near him. Before any buſineſs is done, all the members of the houſe of commons take the oaths of allegiance and ſupremacy, &c. and ſubſcribe their opinions againſt tranſubſtantiation, &c. and if any member of that houſe votes, or ſits there during any debate, after the ſpeaker is choſen, without having firſt taken theſe oaths, between the hours of nine and four in a full houſe, he is adjudged a popiſh recuſant convict, and incapable of any office, and forfeits five hundred pounds. The ſame teſt the lords too, though they do not take the oaths, are obliged to comply with. When the parliament is thus met, no members are to depart from it without leave. Upon extraordinary occaſions, all the members are ſometimes ſummoned, in which caſe every lord ſpiritual and temporal, and every knight, citizen, and burgeſs is to come to parliament, except he can reaſonably and honeſtly excuſe himſelf; or be amerced: that is, reſpectively, a lord by the lords, and a commoner by the commons.

All members of parliament, in order that they may attend the public ſervice of their country, have the privilege for themſelves and their menial ſervants, of being freed from arreſts, attachments, impriſonments, &c. for debts, treſpaſſes, &c. but not from arreſts for treaſon, felony, and breach of the peace: however, it is ordained by ſtatute, that actions may be commenced, in any of the courts of Weſtminſter, againſt perſons intitled to privilege of parliament, after a prorogation or diſſolution, till a new parliament is called, or the ſame become re-aſſembled; and likewiſe after an adjournment for above fourteen days; and the reſpective courts, in ſuch a caſe, have power to proceed to judgment, &c. Here the proceſs is to be ſummons diſtreſs infinite, &c. till the parties ſhall enter an appearance; and for default thereof, the real or perſonal eſtate of the defendant may be ſequeſtered; though the plaintiff may not, in that caſe, arreſt the body of any member of parliament: 12 William III. c. 3.

Anciently all the people had votes in elections, till it was enacted by Henry VI. that none but freeholders, who had a yearly revenue of forty ſhillings, ſhould be admitted to vote for knights of the ſhire.

The manner of debating upon, and paſſing bills in parliament, is as follows: any member may move to have a bill brought in, which, upon a queſtion put, being agreed to by the majority, this perſon, with others, is ordered to prepare and bring in the ſame. When it is ready, a time is appointed for its being read, and after the clerk's reading it, the ſpeaker reads an abſtract of it, and puts the queſtion whether or no it ſhall have a ſecond reading? and after a ſecond reading, the queſtion is put, whether or no it ſhall be committed? which is either to a committee of the whole houſe, if it be of importance, or to a private committee, any member naming the perſons. The committee being appointed, and a chairman choſen, the chairman reads the bill, paragraph by paragraph, puts every clauſe to the queſtion, fills up the blanks and makes amendments, according to the opinion of the majority. The bill thus gone through, the chairman makes his report at the ſide-bar of the houſe, reads all the additions and amendments, &c. and moves for leave to bring up the report to the table; which granted, he delivers it to the clerk, who reads the amendments, &c. The ſpeaker then puts the queſtion, whether they ſhall be read a ſecond time? and if agreed to, he reads them himſelf. To ſo many of the amendments as the houſe aquieſces in, the queſtion is now put, whether the bill, thus amended, ſhall be ingroſſed and written fair upon parchment, and read a third time? and the bill being ingroſſed, the ſpeaker holds it in his hand, and aſks if it ſhall paſs? If the majority be for it, the clerk writes on it, *Soit baillé aux ſeigneurs*, let it be delivered to the lords: or, if in the houſe of lords, *Soit baillé aux communes*, let it be delivered to the commons. If a bill be rejected, it cannot be any more propoſed during that ſeſſion. A bill for a general pardon has but one reading.

When a member of the houſe of commons ſpeaks, he ſtands up, uncovered, and directs his ſpeech to the ſpeaker only. If what he ſays be anſwered by another, he is not allowed to reply the ſame day, unleſs perſonal reflections have been caſt upon him; but when the commons, in order to have a greater freedom of debate, have reſolved themſelves into a committee of the whole houſe, every member may ſpeak to a queſtion as often as he thinks neceſſary. In the houſe of lords they vote, beginning at the puiſne, or loweſt baron, and ſo up orderly to the higheſt, every one anſwering *content* or *not content*. In the houſe of commons they vote by *yeas* and *nays*; and if it be dubious which are the greater number, the houſe divides. If the queſtion be about bringing any thing into the houſe, the *yeas* go out; but if it be about any thing the houſe already has, the *nays* go out. In all diviſions the ſpeaker appoints four tellers, two of each opinion. In a committe of the whole houſe, they divide by changing ſides, the *yeas* taking the right, and the *nays* the left of the chair; and then there are but two tellers. If a bill paſs one houſe, and the other demur to it, a conference is demanded in the painted chamber, where certain members are deputed from each houſe; and here the lords ſit covered, and the commons ſtand bare, and debate the caſe. If they diſagree, the affair is null; but if they agree, this, with the other bills that have paſſed both houſes, is brought down to the king in the houſe of lords, who comes thither clothed in his royal robes; before him the clerk of the parliament reads the title of each bill, and as he reads, the clerk of the crown pronounces the royal aſſent or diſſent. If it be a public bill, the royal aſſent is given in theſe words, *Le roy le veut*, the king will have it ſo; if private, *Soit fait comme il eſt deſiré*, let the requeſt be complied with: if the king refuſe the bill, the anſwer is, *Le roy s'aviſera*, the king will think of it: and if it be a money-bill, the anſwer is, *Le roy remercie ſes loyaux ſujets, accepte leur benevolence, & auſſi le veut*; the king thanks his loyal ſubjects, accepts their benevolence, and therefore grants his conſent.

PARNASSUS, a mountain of Greece, much celebrated by ancient poets, ſituated near Caſtro in Livadia.

PAROCHIAL, ſomething belonging to a pariſh. See PARISH, CHURCH, &c.

PARODICAL *Degrees of an Equation*, in algebra, are the ſeveral regular terms in quadratic, cubic, biquadratic equations, &c. the indexes of whoſe powers aſcend or deſcend orderly in an arithmetical progreſſion, as $z^3 + z^2 m + zr = s$, in a cubical equation, where no term is wanting, but having all its parodic degrees, the indexes of the terms regularly deſcending thus 3, 2, 1, 0.

PARODY, παρωδία, a popular maxim, adage, or proverb.

Parody is alſo a poetical pleaſantry, conſiſting in applying the verſes written in one ſubject, by way of ridicule to another; or in turning a ſerious work into a burleſque, by affecting to obſerve, as nearly as poſſible, the ſame rhymes, words and cadences. It comes near to what ſome of our late writers call traveſty; and was firſt ſet on foot by the Greeks, from whom we borrow the name.

PAROL, or PAROLE, in law, is uſed for a plea in court: ſometimes this word is joined with the term leaſe; thus leaſe-parol denotes a leaſe by word of mouth, in order to diſtinguiſh it from a leaſe in writing.

PARONYCHIA, a whitlow, in ſurgery, a painful kind of tumor, ariſing at the ends of the fingers at the roots of the nails.

The word is Greek, and formed of παρα, near, and ονυξ, the nail.

For the eaſier cure of a paronychia, its ſpecies ſhould firſt be conſidered. If it be of the mild or firſt kind, and has not penetrated deep, the cure may, without difficulty, be obtained. As ſoon as the purulent matter becomes

boiled in milk or water, make a gargariſm to be held in the mouth warm; and the remaining herbs may be ſowed up in a bag, and applied hot to the cheeks.

But if the diſorder cannot be thus diſperſed, emollient applications of mallows, &c. are good; and to forward the maturation externally, a half roaſted fig may be applied: and when the ſoftneſs of the tumor ſhews that the matter is ſuppurated, it ought immediately to be opened by the lancet, to prevent the matters lodging there, and eroding the bone, and producing a fiſtula or caries. After it is opened, the matter ſhould be gently preſſed out with the fingers, and the mouth frequently waſhed with red wine, and mixed with a decoction of vulnerary herbs, till it is well. When the ulcer has penetrated deep, it will be neceſſary to inject the ſame liquors with a ſyringe, and compreſs the part by a proper external bandage, to make the bottom part heal firſt; and when it is already become fiſtulous, and has callous edges, it may then often be cured by injecting tincture of myrrh, and elixir proprietatis, continuing this for ſome time. If all theſe prove ineffectual, the fiſtula muſt be laid open by inciſion, and the caries removed by medicines, cauſtics, or the actual cautery. If this proceeds, as ſometimes it does, from a carious tooth, this is firſt of all to be extracted, otherwiſe the tumor will degenerate into a fiſtula: and it is always beſt to be early in making the inciſion.

PASQUIN, a mutilated ſtatue at Rome, in a corner of the palace of the Urſini: it takes its name from a cobler of that city called Paſquin, famous for his ſneers and gibes, and who diverted himſelf with paſſing his jokes on all the people who went through the ſtreet. After his death, as they were digging up the pavement before his ſhop, they found in the earth the ſtatue of an ancient gladiator, well cut, but maimed, and half ſpoiled: this they ſet up in the place where it was found, and by common conſent named it Paſquin. Since that time all ſatires are attributed to that figure, and are either put into its mouth or paſted upon it, as if they were wrote by Paſquin redivivus; and theſe are addreſſed by Paſquin to Marforio, another ſtatue at Rome. When Marforio is attacked, Paſquin comes to his aſſiſtance; and when Paſquin is attacked, Marforio aſſiſts him in his turn.

PASQUINADE, a ſatirical libel faſtened to the ſtatue of Paſquin: theſe are commonly ſhort, merry, and pointed; and from hence the term has been applied to all lampoons of the ſame caſt. The difference between a paſquinade and a ſatire is, that the end of the latter is to correct and reform, while that of the former is only to ridicule and expoſe.

PASS, a ſtraight, difficult, and narrow paſſage, which ſhuts up the entrance into a country.

Pass *of Arms*, in chivalry, a bridge, road, &c. which the ancient knights undertook to defend.

Pass, or Passade, in fencing, an advance or leap forward upon the enemy.

PASSADE, in the manege, is a turn or courſe of a horſe backwards or forwards, on the ſame ſpot of ground.

PASSAGE, in the manege, is a horſe's walking or trotting in ſuch a manner that he raiſes the outward hind-leg, and the inward fore-leg together; and ſetting theſe two on the ground, raiſes the other two alternately, never gaining above a foot of ground at a time.

Passage, or Passo, in muſic, a part of an air or tune, conſiſting of ſeveral ſhort notes, as quavers, ſemiquavers, &c. laſting one, two, or at moſt three meaſures, in the beginning of a piece, which is to be afterwards imitated in the other notes of the piece, not with the ſame chords or notes, but only by obſerving the ſame motion, number and figure, as in the notes of the firſt paſſage.

Birds of Passage, a name given to thoſe birds which at certain ſtated ſeaſons of the year remove from certain countries, and at other ſtated times return to them again, as our quails, woodcocks, ſtorks, nightingales, ſwallows, and many other ſpecies.

Right of Passage, in commerce, is an impoſition or duty exacted by ſome princes, either by land or ſea, in certain cloſe and narrow places in their territories, on all veſſels and carriages, and even ſometimes on perſons or paſſengers coming in or going out of ports, &c.

PASSANT, in heraldry, a term applied to a lion, or other animal, in a ſhield, appearing to walk leiſurely: for moſt beaſts, except lions, the term trippant is frequently uſed inſtead of paſſant.

PASSIONS, in moral philoſophy, are certain motions of the ſoul, which make it purſue what appears to be good, and avoid whatever threatens evil.

Passions, in medicine, make one of the non-naturals, and produce very ſenſible effects. Joy, anger, and fear, are the principal. In the two firſt, the ſpirits are hurried with too great vivacity; whereas, in fear or dread, they are as it were curbed and concentrated: whence we may conclude, that they have a very bad effect upon health; and therefore it will be beſt to keep them within bounds as much as poſſible, and to preſerve an inward ſerenity, calmneſs, and tranquility. Continual ſorrow and anguiſh of mind render the fluids thick, and generate viſcid and acid crudities in the ſtomach, and at length render the body unapt for a due circulation; whence proceed obſtructions of the viſcera, and many chronical diſorders. Anger conſtringes the bilious veſſels in particular, and cauſes too great an evacuation of the bile; produces ſtrictures in the ſtomach and duodenum; whence the bilious humours are amaſſed and corrupted; laying a foundation for vomiting, bilious fevers, and cardialgiæ.

Passions, in painting, are the external expreſſions of the different diſpoſitions and affections of the mind; but particularly their different effects upon the ſeveral features of the face; for though the arms, and indeed every part of the body, ſerve likewiſe, by their quick, languid, and variouſly diverſified motions, to expreſs the paſſions of the ſoul; yet, in painting, this difference is moſt conſpicuous in the face.

In ſorrow, joy, love, ſhame, and compaſſion, the eyes ſwell all of a ſudden, are covered with a ſuperabundant moiſture, and drop tears; and in grief eſpecially, the corners of the mouth hang down, the eye-lids are half ſhut, and the pupil of the eye is elevated and half covered; and all the other muſcles of the face are relaxed, ſo that the viſage appears longer than ordinary.

In fear, terror, fright, and horror, the eye-brows are greatly elevated, the eye-lids are expanded as wide as poſſible, ſo as to diſcover the white of the eye, and the pupil is depreſſed and half covered by the lower eye-lid; the hair ſtands an end; the mouth is at the ſame time wide open, and the lips ſo far drawn back, that the teeth both of the upper and under jaw appear.

Contempt is expreſſed by raiſing one ſide of the upper-lip, ſo as to diſcover the teeth, whilſt the other ſide has a movement like that in laughter; the eye, on that ſide where the teeth appear, is half ſhut, whilſt the other remains open; however, both the pupils are depreſſed.

In jealouſy, envy, hatred, and malice, the eye-brows are knit; and, in laughter, all the parts agree, tending as it were towards the center of the face.

Mr. le Brun has been extremely happy in expreſſing the ſeveral paſſions, and the examples he has left of them deſerve imitation.

Passions, in poetry, are of ſingular uſe in diſtinguiſhing the characters of the actors. See the article Character.

Passion, or *Croſs of the* Passion, in heraldry, is ſo called, becauſe reſembling the ſhape of that on which our Saviour is thought to have ſuffered; that is, not croſſed in the middle, but a little below the top, with arms ſhort in proportion to the length of the ſhaft.

Passion-Flower, *Paſſiflora*, in botany, a genus of plants, the corolla of which conſiſts of five petals, of the largeneſs and figure of thoſe of the cup: the fruit is a berry, ſupported on a pedicle.

There are ſeveral ſorts of this plant, but that which is the moſt commonly cultivated is the *paſſiflora foliis palmatis intregrimus*, paſſion-flower with hard ſharped entire leaves, or the common paſſion-flower.

This grows naturally in the Braſils, yet is hardy enough to thrive in the open air here, and is ſeldom injured except in very ſevere winters, which commonly kills the branches to the ground, and ſometimes deſtroys the roots; this riſes in a few years to a great height, if they have proper ſupport. I have ſeen ſome of theſe plants, whoſe branches were trained up more than forty

feet

feet high. The ſtalks will grow almoſt as large as a man's arm, and are covered with a purpliſh bark, but do not become very woody. The ſhoots from theſe ſtalks are often twelve or fifteen feet long in one ſummer; they are very ſlender, ſo muſt be ſupported, otherwiſe they will hang to the ground, intermix with each other, and appear very unſightly. Theſe are garniſhed at each joint with one hand-ſhaped leaf, compoſed of five ſmooth entire lobes. Their foot ſtalks are near two inches long, and have two ſmall leaves or ears embracing the ſtalks at their baſe; and from the ſame point comes out a long claſper, which twiſts round the neighbouring plants, whereby the ſtalks are ſupported. The flowers come out at the ſame joints as the leaves; theſe have foot-ſtalks almoſt three inches long; they have an outer cover compoſed of three concave oval leaves, of a paler green than the leaves of the plant, which are little more than half of the empalement, which is compoſed of five oblong blunt leaves, of a very pale green; within theſe are five petals, nearly of the ſame ſhape and ſize with the empalement, ſtanding alternately between them. In the center of the flower ariſes a thick club-like column about an inch long, on the top of which ſits an oval germen, from whoſe baſe ſpreads out five awl-ſhaped horizontal ſtamina, which are terminated by oblong broad ſummits, faſtened in the middle to the ſtamina, hanging downward; theſe may be moved round without ſeparating from the ſtamina; their under ſurface is charged with yellow farina, and on the ſide of the germen ariſe three ſlender purpliſh ſtyles, near an inch long, ſpreading from each other, terminated by obtuſe ſtigmas. Round the bottom of the column are two orders of rays, the inner, which is the ſhorteſt, inclines upward to the column, the outer, which is near half the length of the petals, ſpreads flat upon them; theſe rays are compoſed of a great number of thread like filaments, of a purple colour at bottom, but are blue on the outſide. Theſe flowers have a faint ſcent, and continue but one day; after they fade, the germen on the top of the column ſwells to a large oval fruit, about the ſize and ſhape of the mogul plum, and when ripe is of the ſame pale yellow, incloſing a ſweetiſh diſagreeable pulp, in which are lodged oblong ſeeds. This plant begins to flower early in July, and there is a ſucceſſion of flowers daily, till the froſt in autumn puts a ſtop to them.

It may be propagated by ſeeds, which ſhould be ſown upon a moderate hot-bed, which will bring up the plants much ſooner than when they are ſown in the open air, ſo they will have more time to get ſtrength before winter. When the plants are come up two or three inches high, they ſhould be carefully taken up, and each planted in a ſeparate ſmall pot filled with good kitchen garden earth, and plunged into a moderate hot-bed to forward their taking new root; after which they ſhould be gradually inured to bear the open air, to which they ſhould be expoſed in ſummer, but in the autumn they muſt be placed under a garden frame to ſcreen them from the froſt, but they ſhould have the free air at all times in mild weather. In the ſpring following they ſhould be turned out of the pots, and planted againſt a good aſpected wall, where they may have height for their ſhoots to extend, otherwiſe they will hang about and entangle with each other, and by that means make but an indifferent appearance; but when buildings are to be covered, this plant is very proper for the purpoſe. After they have taken good root in their new quarters, the only care they will require is to train their ſhoots up againſt the wall, as they extend in length, to prevent their hanging about; and if the winter proves ſevere the ſurface of the ground about their roots ſhould be covered with mulch to keep the froſt from penetrating of the ground; and if the ſtalks and branches are covered with mats, peas haulm, ſtraw, or any ſuch light covering it will protect them in winter; but this covering muſt be taken off in mild weather, otherwiſe it will cauſe the branches to grow mouldy, which will be more injurious than the cold. In the ſpring the plants ſhould be trimmed, when all the ſmall weak ſhoots ſhould be entirely cut off, and the ſtrong ones ſhortened to about four or five feet long, which will cauſe them to put out ſtrong ſhoots for flowering the following year.

This plant is alſo propagated by laying down the branches, which in one year will be well rooted, ſo may be taken off from the old plants and tranſplanted, where they are deſigned to remain. The cuttings of this will alſo take root, if they are planted in a loamy ſoil not too ſtiff, in the ſpring before they begin to ſhoot. If theſe are covered with bell or hand glaſſes to exclude the air, they will ſucceed much better than when they are otherwiſe treated; but when the cuttings put out ſhoots, the air ſhould be admitted to them, otherwiſe they will draw up weak, and ſpoil: they muſt be afterward treated as the layers.

Thoſe plants, which are propagated by layers or cuttings, do not produce fruit ſo plentifully as the ſeedling plants, and I have found the plants, which have been propagated two or three times, either by layers or cuttings, ſeldom produce fruit, which is common to many other plants. *Miller's Gard. Dict.*

PASSION-WEEK, the week immediately preceding the feſtival of Eaſter: ſo called, becauſe in that week our Saviour's paſſion and death happened. See the article EASTER.

PASSIVE, in general, denotes ſomething that ſuffers the action of another, called an agent, or active power.

In grammar, the verb or word that expreſſes this paſſion, is termed a paſſive verb; which, in the learned languages, has a peculiar termination, as *amor*, *doceor*, &c. in Latin; that is, an *r* is added to the actives *amo*, *doceo*: and, in the Greek, the inflection is made by changing ω into ομαι, as τύπτω, τυπτομαι, &c. But, in the modern languages, the paſſive inflection is performed by means of auxiliary verbs, joined to the participle paſſive; as *I am praiſed*, in Latin *laudor*, and in Greek επαινεομαι; or *I am loved*, in Latin *amor*, and in Greek φιλεομαι. Thus it appears, that the auxliary verb *I am*, ſerves to form the paſſives of Engliſh verbs; and the ſame holds of the French, as *je ſuis loué*, I am praiſed; *j' aye été loué*, I have been praiſed, &c.

PASSOVER, a ſolemn feſtival of the Jews, celebrated on the fourteenth day of the month next after the vernal equinox, and inſtituted in commemoration of their coming out of Egypt; becauſe on the night before their departure the deſtroying angel, who put to death the firſt-born of the Egyptians, paſſed over the houſes of the Hebrews, which were ſprinkled with the blood of a lamb. The whole tranſaction is related in the twelfth chapter of Exodus.

They were ordered before this feſtival to kill the paſchal lamb, and to ſprinkle their door-poſts with its blood; and the following night, which was the grand feaſt of the paſſover, and which was to continue ſeven days, they were to eat the lamb roaſted with a ſallad of wild lettuces, or other bitter herbs, in the poſture of travellers; and if any part remained the day following, it was to be thrown into the fire; and for eight days together no leavened bread was to be uſed, on pain of being cut off from the people.

PASS-PAROLE, a command given at the head of an army, and thence communicated to the rear by paſſing it from mouth to mouth.

PASS-PORT, or PASS, a licence or writing obtained from a prince or governor, granting liberty and ſafe conduct to paſs through his territories without moleſtation.

PASS-VOLANT, or PASSE-VOLANT, in a military ſenſe, the ſame with a faggot. See FAGGOT.

PASTBOARD, a kind of thick paper formed of ſeveral ſheets of paper paſted together.

PASTE, a compoſition of water and flour, boiled to a conſiſtence; uſed by various artifices, as ſadlers, upholſterers, book-binders, &c.

In cookery, paſte is the compoſition of flour, &c. wherein pies are baked; and in confectionary, paſte denotes a preparation of ſome fruit, made by beating the pulp thereof with ſome fluid, or other admixture; and afterwards drying it with ſugar, till as pliable as common paſte.

PASTE, in the glaſs-trade, a kind of coloured glaſs, made of a calcined cryſtal, lead, and metellic preparations, ſo as to imitate the natural gems; for the manner of effecting which, ſee GEM.

PASTEL,

prominent, like a tubercle or bliſter, let the ſurgeon place a finger on each ſide of the affected part; and ſtretching the ſkin, by drawing it on both ſides, from the whitlow, make the inciſion: thus will the matter be diſcharged, and the finger will generally heal ſpontaneouſly. Hildanus, in cent. 1. obſ. 97, gives the following ſafe and ready method of curing a paronychia, which he had frequently tried with ſucceſs. He firſt fomented the finger ſeveral times, with the decoction of the flowers of the chamomile, and melilot, and fenugreek, and quince-ſeeds, boiled in cows milk; then he gradually cut off the ſurface of the ſkin where the pain was. The ſkin being thus removed, ſome red ſpecks appeared, in which, upon inciſion, he found one or two ſmall drops of a red water; and, this being diſcharged, he applied a linen cloth moiſtened with a ſolution of Venice treacle in brandy; the pain immediately ceaſed, and next day the finger was ſound.

If the diſorder is ſeated near the roots of the nails, beneath it, or at either of its ſides, the whole, or part of the nail, is generally loſt. If the purulent matter is concealed under the nail, it affects the adjacent parts with inflammation and intenſe pains. In this caſe, Solingen, with other ſurgeons, adviſes, firſt, to remove that part of the nail under which the morbific matter ſtagnates, either by extirpating it entirely, or by making an inciſion in it; and, having expreſſed the matter, the wound may be eaſily healed, by the application of lint moiſtened with ſpirit of wine or lime water.

PAROTIDES, *Parotid Glands*, in anatomy, denote two large glands behind the ears.

The word is Greek, and derived from παρα, near, and ους, the ear.

PAROTIDES, in medicine, are abſceſſes, or inflammations of the parotid glands.

Theſe tumors are either mild or malignant; they are ſaid to be mild, when they ariſe ſpontaneouſly, without any preceding contagious or peſtilential diſeaſe, as they frequently do in growing children; and theſe are generally not dangerous. Of this kind alſo are thoſe which ariſe after gentle fevers, being a critical tranſlation of the diſeaſe. Thoſe bubos are called malignant, which happen in the peſtilence or venereal diſeaſe; whence they are denominated peſtilential or venereal bubos. See the article BUBO.

PAROXYSM, in medicine, the acceſs or fit of a diſeaſe.

The word is Greek, and formed of παρα, and οξυς, ſharp.

PARRICIDE, *Parricida*, *Patricida*, in ſtrictneſs, denotes the murder or murderer of a father, as matricide is the murder or murderer of a mother.

The word is Latin, and formed of *pater*, a father, and *cædo*, to ſlay.

It is alſo extended to the murder of any near relation.

PARRYING, in fencing, the action of warding off the blows aimed at one by another. See the article FENCING.

PARSLEY, in botany, an umbelliferous plant, with deep green winged leaves, of which thoſe that grow on the ſtalk are divided into fine oblong narrow ſegments; the ſeeds are ſmall, ſomewhat crookedly plano-convex, of a duſky greeniſh colour, with four yellow ridges along the convex ſide; the root long, whitiſh, about the thickneſs of the finger. It is biennial, a native of moiſt grounds in the ſouthern parts of Europe, and common in our culinary gardens.

The roots of parſley are ſometimes uſed in apozems, and ſuppoſed to be aperient and diuretic, but liable to produce flatulencies. Their taſte is ſweetiſh, accompanied with a ſlight warmth or flavour, ſomewhat reſembling that of a carrot. The leaves of the plant have a greater warmth and leſs ſweetneſs than the roots.

The ſeeds, ſaid to be carminative, reſolvent, and diuretic, and commended in the German ephemerides for deſtroying cutaneous inſects in children, are in taſte warmer and more aromatic than any other part of the plant, and accompanied with a conſiderable bitterneſs.

Parſley is, by ſome ſkilful perſons cultivated in fields for the uſe of ſheep, it being a ſovereign remedy to preſerve them from the rot, provided they are fed twice a week for two or three hours each time with this herb; but hares and rabbets are ſo fond of it, that they will come from a great diſtance to feed upon it; and in countries where theſe animals abound, they will deſtroy it, if it be not very ſecurely fenced againſt them; ſo that whoever has a mind to have plenty of hares in their fields, by cultivating parſley, will draw all the hares of the country to them.

The beſt time for ſowing it in the fields is about the middle or latter end of February; the ground ſhould be made fine, and the ſeeds ſown pretty thick, in drills, drawn about a foot aſunder, that the ground may be kept hoed between the drills, to deſtroy the weeds, which, if permitted to grow, will ſoon over-run the parſley. Two buſhels of ſeed will ſow an acre of land.

PARSNIP, paſtinacha, in botany, the name of a well-known root.

The parſnip is to be propagated by ſowing its ſeeds in February or March, in a rich mellow ſoil, which muſt be deep dug, that the roots may be able to run deep without hindrance.

It is a common practice to ſow carrots, at the ſame time, upon the ſame ground with the parſnips; and if the carrots are deſigned to be drawn young, there is no harm in it. The parſnips, when they are grown up a little, muſt be thinned to a foot diſtance, and carefully kept clear of weeds. They are fineſt taſted, juſt at the ſeaſon when the leaves are decayed; and ſuch as are deſirous to eat them in ſpring ſhould have them taken up in autumn, and preſerved in ſand. When the ſeeds are to be ſaved, ſome very ſtrong and fine plants ſhould be left for it at four feet diſtance; and towards the end of Auguſt, or in the beginning of September, the ſeeds will be ripe; they muſt then be carefully gathered, and dried on a coarſe cloth. They ſhould always be ſown the ſpring following, for they do not keep well. *Miller's Gard. Dict.*

The common wild parſnip is frequent by road ſides, and in dry paſtures; it flowers in autumn, and ripens its ſeed ſoon after. The ſeeds deſerve to be brought into uſe in medicine, much more than they are at preſent. They are warm and carminative, though not ſo violently hot as the caraway ſeeds and others, which we commonly uſe on theſe occaſions. They diſpel flatuſes, and are in great eſteem among the country people, for curing the cholic. They alſo are diuretic and aperient, and gently promote the menſes.

PARSON, the rector or incumbent of a pariſh church.

PARSONAGE, a rectory, or pariſh church, commonly endowed with a houſe, glebe, and tithe, for the maintenance of a miniſter, with cure of ſouls within ſuch pariſh.

PART, *Pars*, a portion of ſome whole, conſidered as actually divided or diviſible.

Noble or eſſential PARTS, in phyſic, thoſe abſolutely neceſſary to life, as the heart, brain, &c.

Natural or genital PARTS, thoſe miniſtering to generation.

PART, in geometry and aſtronomy, is applied to the diviſion of lines and circles, &c.

Aliquot PART, and *Aliquant* PART, in arithmetic. See ALIQUOT and ALIQUANT.

Proportional PART is a part or number agreeable and analogous to ſome other part or number; or a medium to find ſome number or part unknown, by proportion and equality of reaſon.

Similar PARTS are thoſe which are to one another, as their wholes are to one another.

Organical PART. See ORGANICAL.

PART, in muſic, denotes a piece of the ſcore, or partition, written by itſelf, for the conveniency of the muſician; or it is one or more of the ſucceſſions of ſounds, which makes the harmony, written apart. Or, the parts are the ſounds made by ſeveral perſons, ſinging or playing in concert.

Muſic in parts was unknown to the ancients; they had but one part: all their harmony conſiſted in the ſucceſſion of notes, none in the conſonance.

There are four principal parts, the treble, baſs, tenor,

and counter tenor. Some compare the four parts in muſic to the four elements; the baſs, they ſay, repreſents the earth; the tenor, the water; counter-tenor, air; and treble, fire.

PARTS *of Speech*, in grammar, are all the words that enter the compoſition of a diſcourſe, as noun, pronoun, verb, participle, adverb, conjunction, prepoſition, and interjection.

PART *of Fortune*, in the judicial aſtrology, is the lunar horoſcope, or the point wherein the moon is, at the time when the ſun is in the aſcending part of the eaſt. The ſun in the aſcendant, is ſuppoſed, according to this ſcience, to give life, and the moon diſpences the radical moiſture, and is one of the cauſes of fortune. In horoſcopes, the part of fortune is repreſented by a circle divided by a croſs. See HOROSCOPE.

PARTERRE, in gardening, a level diviſion of ground, which for the moſt part faces the ſouth, and beſt front of an houſe; and is generally furniſhed with greens, flowers, &c.

There are ſeveral ſorts of parterres, as plain glaſs with borders, and parterres of embroidery, &c. Plain parterres are more beautiful in England than in any other country, by reaſon of the excellency of our turf, and that decency and unaffected ſimplicity that it affords to the eye of the ſpectator. Other parterres are cut into ſhell and ſcroll-work, with ſand-alleys between them; which ſort of parterres are eſteemed fineſt in France. As to the general proportions of parterres, an oblong or long ſquare is eſteemed the beſt: therefore a parterre ſhould not be leſs than twice as long as it is broad; twice and a half is accounted a very good proportion; and it is very rare that three times is exceeded. As to the breadth of a parterre, it is to take its dimenſions from the breadth of the front of the houſe; if the front of the houſe is one hundred feet long, the breadth of the parterre ſhould be one hundred and fifty feet; and if the front of the houſe be two hundred feet, the parterre ſhould be fifty feet broader: but where the front exceeds the breadth of this parterre, it will be a good proportion to make the parterre of the ſame dimenſions with the front. There ſhould be a terrace-walk on each ſide of the parterre, for an elevation proper for view; and, therefore, there ſhould never be the flat of a parterre between terrace-walk and terrace-walk above three hundred feet; nor can it be well made leſs than one hundred and forty. As to the adorning and furniſhing theſe parterres, whether it be plain or with embroidery, that depends much upon the form of them, and therefore muſt be left to the judgment and fancy of the deſigner.

PARTI, PARTIE, PARTY, or PARTED, in heraldry, is applied to a ſhield or eſcutcheon, denoting it divided or marked out into partitions.

PARTICIPATION, that which gives a part or ſhare in any thing, either by right or grace.

PARTICIPLE, *Participium*, in grammar, an adjective formed of a verb, ſo called becauſe it participates partly of the properties of a noun, and partly of thoſe of a verb; being variable through genders and caſes, like the former; and regarding time, action, paſſion, &c. in manner of the latter. See NOUN and VERB.

Thus the participle retains the attribute of the verb; and, moreover, the deſignation of the time or tenſe; there being participles of the preſent, the præterite, and future, eſpecially in Greek: but this is not always obſerved, the ſame participle being frequently joined with all ſorts of tenſes. There are active and paſſive participles; the active, in Latin, end in *ans* or *ens*, as *amans*, *docens*; the paſſive in *us*, as *amatus*, *doctus*; though there are ſome of theſe that are active, namely thoſe of verbs deponents, as *locutus*. But there are others likewiſe which add to this paſſive ſignification a ſort of compulſive, or obligatory ſenſe; theſe are to participles in *dus*, as *amandus*, *which ought to be loved*; though ſometimes the latter ſignification is entirely loſt.

The property of the participles of verbs active, is to ſignify the action of the verb, as it is in the verb, that is, in the courſe of the action itſelf; whereas the verbal nouns, which ſignify actions alſo, ſignify them rather in the habit than in the act: for which reaſon the participles have the ſame government as the verb, as *amans deum*; whereas verbal nouns have only the ſame government as nouns, as *amator dei*: and the participle itſelf has the ſame government as nouns when it ſignifies rather the habit than the act of the verb, by reaſon it then has only the nature of a ſimple noun verbal, as *amans virtutis*.

In our language, the participles and gerunds are not at all diſtinguiſhable.

PARTICLE, in phyſiology, the minute part of a body, an aſſemblage of which conſtitute all natural bodies. See the articles ATOM and MATTER.

It is the various arrangment and texture of theſe particles, with the difference of coheſion, &c. that conſtitute the various kinds of bodies. The ſmalleſt particles cohere with the ſtrongeſt attraction, and compoſe bigger particles of weaker coheſion, and many of theſe cohering compoſe bigger particles, whoſe vigour is ſtill weaker; and hereupon the operations in chemiſtry, and the colours of natural bodies depend, and which, by cohering, compoſe bodies of ſenſible bulk. The coheſion of the particles of matter, the epicureans imagined, was effected by means of hooked atoms; the ariſtotelians, by reſt; but Sir Iſaac Newton ſhews, that it is done by means of a certain power, whereby the particles mutually attract and tend towards each other. By this attraction of the particles, he ſhews, that moſt of the phænomena of the leſſer bodies are affected, as thoſe of the heavenly bodies are, by the attraction of gravity. See ATTRACTION and GRAVITATION.

PARTICLE, in grammar, a denomination for all thoſe ſmall words that tie or unite others together, or that expreſs the modes or manners of words, uſually included by grammarians under theſe four parts of ſpeech, viz. adverbs, prepoſitions, interjections, and conjunctions. See the articles PARTS *of Speech*, ADVERB, &c.

Mr. Locke obſerves, that it is in the right uſe of particles, the clearneſs and beauty of a good ſtyle more particularly conſiſts.

To expreſs the dependance of his thoughts and reaſonings, one upon another, a man muſt have words to ſhew what connection, reſtriction, diſtinction, oppoſition, emphaſis, &c. he gives to each reſpective part of his diſcourſe. This cannot be rightly underſtood without a clear view of the poſtures, ſtands, turns, limitations, exceptions, and ſeveral other thoughts of the mind. Of theſe there is a great variety, much exceeding the number of particles that moſt languages have to expreſs them by; for which reaſon it happens, that moſt of thoſe particles have divers, and ſometimes almoſt oppoſite ſignifications.

PARTICULAR, *Particularis*, a relative term referring to ſpecies or individual, and oppoſed to general or univerſal.

PARTIES, in law, ſignify the perſons that are named in a deed or fine, viz. thoſe that made the deed, or levied the fine, and alſo thoſe to whom the ſame was made or levied.

PARTING, or DEPARTING, a method of ſeparating gold and ſilver, by means of aqua-fortis; for the operation of which, ſee the articles ASSAYING and QUARTATION.

PARTNER and PARTNERSHIP. See the article FELLOWSHIP.

PARTRIDGE, in ornithology, is a ſpecies of tetrao, with a naked ſcarlet mark behind the eyes.

The common partridge is too well known, to need a farther deſcription: it is common in fields, and called by authors perdix. But beſides the common kind, there is another ſomewhat larger ſpecies called the red-legged partridge, with a grey tail, variegated in the upper part with brown.

PARTURITION, the ſame with delivery. See the article DELIVERY.

PARTY, in politics, denotes a faction conſidered as oppoſing another: ſuch are the Whigs and Tories.

In law, party-jury is one impanelled in actions brought for or againſt foreigners. See the article MEDIETAS LINGUÆ.

PARULIDES, in ſurgery, tumours and inflammations of the gums, commonly called gum-boils.

They are to be treated with diſcutients, like other inflammatory tumours. Sage, camomile and elder-flowers, boiled

PASTEL, a name by which ſome call iſatis, or woad. See ISATIS.

PASTERN *of a Horſe*, in the manege, is the diſtance between the joint next the foot, and the coronet of the hoof. This part ſhould be ſhort, eſpecially in middle-ſized horſes, becauſe long paſterns are weak, and cannot ſo well endure travelling.

PASTERN-JOINT, the joint next a horſe's foot.

PASTIL, or PASTEL, among painters, a kind of paſte made of different colours, ground up with gum-water, in order to make crayons. See CRAYON.

Sometimes the crayons themſelves are called paſtils.

PASTIL, in pharmacy, is a dry compoſition of ſweet ſmelling reſins, aromatic woods, &c. ſometimes burnt to clear and ſcent the air of a chamber.

PASTOR, properly ſignifies a ſhepherd, but is now generally uſed for a parſon or miniſter that hath cure of ſouls.

PASTORAL, in general ſomething that relates to ſhepherds; hence we ſay, paſtoral life, manners, poetry, &c.

The original of poetry is aſcribed to that age which ſucceeded the creation of the world: and as the keeping of flocks ſeems to have been the firſt employment of mankind, the moſt ancient ſort of poetry was, probably, paſtoral. It is natural to imagine, that the leiſure of thoſe ancient ſhepherds admitting and inviting ſome diverſion, none was ſo proper to that ſolitary and ſedentary life as ſinging; and that in their ſongs they took occaſion to celebrate their own felicity. From hence a poem was invented, and afterwards improved to a perfect image of that happy time; which, by giving us an eſteem for the virtues of a former age, might recommend them to the preſent. And ſince the life of ſhepherds was attended with more tranquility than any other rural employment, the poets choſe to introduce their perſons, from whom it received the name of paſtoral.

A paſtoral is an imitation of the action of a ſhepherd, or one conſidered under that character. The form of this imitation is dramatic, or narrative, or mixed with both; the fable ſimple; the manners not too polite nor too ruſtic; the thoughts are plain, yet admit a little quickneſs and paſſion, but that ſhort and flowing; the expreſſion humble, yet as pure as the language will afford; neat, but not florid; eaſy, and yet lively. In ſhort, the fable manners, thoughts and expreſſions are full of the greateſt ſimplicity in nature. The complete character of this poem conſiſts in ſimplicity, brevity, and delicacy; the two firſt of which render an eclogue natural, and the laſt delightful.

If we would copy nature, it may be uſeful to take this idea along with us, that paſtoral is an image of what they call the golden age. So that we are not to deſcribe our ſhepherds, as ſhepherds at this day really are, but as they may be conceived then to have been, when the beſt of men followed the employment. To carry this reſemblance yet farther, it would not be amiſs to give theſe ſhepherds ſome ſkill in aſtronomy, as far as it may be uſeful to that ſort of life. And an air of piety to the gods ſhould ſhine through the poem, which ſo viſibly appears in all the works of antiquity: and it ought to preſerve ſome reliſh of the old way of writing; the connection ſhould be looſe, the narrations and deſcription ſhort, and the periods conciſe. Yet it is not ſufficient that the ſentences only be brief, the whole eclogue ſhould be ſo too. For we cannot ſuppoſe poetry, in thoſe days, to have been the buſineſs of men, but their recreation at vacant hours.

But with reſpect to the preſent age, nothing more conduces to make theſe compoſures natural, than when ſome knowledge in rural affairs is diſcovered. This may be made to appear rather done by chance than on deſign, and ſometimes is beſt ſhewn by inference; leſt, by too much ſtudy to ſeem natural, we deſtroy that eaſy ſimplicity from whence ariſes the delight. For what is inviting, in this ſort of poetry, proceeds not ſo much from the idea of that buſineſs, as of the tranquility of a country life.

We muſt, therefore, uſe ſome illuſion to render a paſtoral delightful; and this conſiſts in expoſing the beſt ſide only of a ſhepherd's life, and in concealing its miſeries. Nor is it enough to introduce ſhepherds diſcourſing together in a natural way, but a regard muſt be had to the ſubject, that it contain ſome particular beauty in itſelf, and that it be different in every eclogue. Beſides, in each of them, a deſigned ſcene or proſpect is to be preſented to our view, which ſhould likewiſe have its variety. This variety is obtained, in a great degree, by frequent compariſons, drawn from the moſt agreeable objects of the country; by interrogations to things inanimate; by beautiful digreſſions, but thoſe ſhort; ſometimes by inſiſting a little on circumſtances; and laſtly, by elegant turns on the words, which renders the numbers extremely ſweet and pleaſing. As for the numbers themſelves, though they are properly of the heroic meaſure, they ſhould be the ſmootheſt, the moſt eaſy and flowing imaginable.

It is by rules, like theſe, we ought to judge a paſtoral. And ſince the inſtructions given for any art are to be delivered as that art is in perfection, they muſt, in neceſſity, be derived from thoſe in whom it is acknowledged ſo to be. It is, therefore, from the practice of Theocritus and Virgil, the only undiſputed authors of paſtoral, that the critics have drawn the foregoing notions concerning it.

Theocritus excels all others in nature and ſimplicity. The ſubjects of his Idyllia are purely paſtoral; but he is not ſo exact in his perſons, having introduced reapers and fiſhermen, as well as ſhepherds. He is apt to be too long in his deſcriptions, of which that of the cup, in the firſt paſtoral, is a remarkable inſtance. In the manners he ſeems a little defective, for his ſwains are ſometimes abuſive and immodeſt, and, perhaps, too much inclining to ruſticity; for inſtance, in his fourth and fifth Idyllia. But it is enough that all others learned their excellencies from him; and that his dialect alone has a ſecret charm in it, which no other could ever attain.

Virgil, who copies Theocritus, refines upon his original; and in all points where judgment is principally concerned, he is much ſuperior to his maſter. Though ſome of his ſubjects are not paſtoral in themſelves, but only ſeem to be ſuch, they have a wonderful variety in them, which the Greek was a ſtranger to. He exceeds him in regularity and brevity, and falls ſhort of him in nothing but ſimplicity and propriety of ſtyle; the firſt of which, perhaps, was the fault of his age, and the laſt of his language.

Among the moderns, their ſucceſs has been greateſt, who have moſt endeavoured to make theſe ancients their pattern. The moſt conſiderable genius appears in the famous Taſſo and our Spenſer. Taſſo, in his Aminto, has as far excelled all the paſtoral writers, as in his Gieruſalemme he has out-done the epic poets of his country. But as this piece ſeems to have been the original of a new ſort of poem, the paſtoral comedy in Italy, it cannot ſo well be conſidered as a copy of the ancients. Spenſer's Calendar, in Mr. Dryden's opinion, is the moſt complete work of this kind, which any nation has produced ever ſince the time of Virgil. Not but that he may be thought imperfect in ſome few points. His eclogues are ſomewhat too long, if we compare them with the ancients. He is, ſometimes, too allegorical, and treats on matters of religion, in a paſtoral ſtyle, as the Mantuan had done before him. He has employed the lyric meaſure, which is contrary to the practice of the old poets. His ſtanza is not ſtill the ſame, nor always well choſen; this laſt may be the reaſon why his expreſſion is ſometimes not conciſe enough: for the tetraſtic has obliged him to extend his ſenſe to the length of four lines, which would have been more cloſely confined in the couplet.

In the manners, thoughts, and characters, he comes near to Theocritus himſelf; though, notwithſtanding all the care he has taken, he is certainly inferior in his dialect: for the Doric had its beauty and propriety in the time of Theocritus; it was uſed in part of Greece, and frequent in the mouths of many of the greateſt perſons; whereas the old Engliſh and country phraſes of Spenſer were either entirely obſolete, or ſpoken only by people of the loweſt condition. As there is a difference between ſimplicity and ruſticity, ſo the expreſſion of ſimple thoughts ſhould be plain, but not clowniſh. The addition he has made of a calendar to his eclogues is very beautiful; ſince by this, beſides the general moral of innocence and ſimplicity, which is common to other authors of paſtoral, he has one peculiar to himſelf; he compares human life to the ſeveral ſeaſons, and at once expoſes to his readers a

view of the great and little worlds, in their various changes and aſpects. Yet the ſcrupulous diviſion of the paſtorals into months has obliged him either to repeat the ſame deſcription in other words, for three months together; or, when it was exhauſted before, entirely to omit it: whence it comes to paſs, that ſome of his eclogues, as the 6th, 8th, and 10th, for example, have nothing but their titles to diſtinguiſh them. The reaſon is evident, becauſe the year has not that variety in it to furniſh every month with a particular deſcription, as it may every ſeaſon.

PASTORAL COLUMN. See COLUMN.

PASTORAL STAFF, the ſame with croſier. See the article CROSIER.

PASTURE, or PASTURE-LAND, that reſerved for feeding cattle.

Paſture-land is of ſuch advantage to huſbandry, that many prefer it even to corn-land, becauſe of the ſmall hazard and labour that attends it, and as it lays the foundation for moſt of the profit that is expected from the arable land, becauſe of the manure the cattle afford which are fed upon it. Where dung is not to be bought, as is often the caſe in places diſtant from large towns, the farmer is forced to proportion his arable to his paſture-land, in ſuch manner, that the cattle fed on the latter may be ſufficient for a ſupply of dung, ſo neceſſary for producing the fruits of the former.

Paſture-lands, are of three kinds: 1. The uplands: theſe lie ſo high as not to be overflowed by rivers, or land-floods. 2. Thoſe low lands which lie near rivers and fens. And 3. Thoſe that lie near the ſea. See the articles UP-LAND, MARSH-LAND, &c.

Paſture-land requires the refreſhment of dung, as well as the arable or corn-land; but there is to be a difference made in the laying it on and ſpreading it. A harrow performs the office of ſpreading the dung on ploughed lands; but the beſt contrivance for paſtures, is, to lay the dung in ſmall heaps, and draw over it a gate ſtuck full of buſhes. All dung that is laid on paſture-land, muſt be laid on in winter, that the rains may waſh its fatneſs into the ground before the ſun ſcorches it, or evaporates its goodneſs. Fine mould mixed with the dung, and ſpread with it over the land, is very good for paſtures; for it is waſhed down to the very roots of the graſs, and gives them a new and fine ſoil juſt in thoſe places where it is moſt wanted.

The beſt manure for paſture-land is the rotten bottoms of old hay-ſtacks; for theſe moulder away into a very rich ſoil, and are always full of vaſt quantities of ſeed, fallen at times from the hay, which all grow when ſpread on the ground: and thus new nouriſhment, and a new ſet of plants, are given at once to the exhauſted ground. But as particularly uſeful as this is for paſture-ground, it is as improper for corn-land, and ſhould by no means ever be ſuffered to mix with the manure for thoſe grounds; as it will then raiſe graſs and other plants, which though of uſe in the paſture are weeds among the corn.

PASTURE *of Plants*, a term uſed by Tull, for the nouriſhment they draw from the earth.

PASTY, in cookery, a preparation of veniſon, veal, lamb, or other meat; which being well boned, beaten to a pulp, and highly ſeaſoned, is incloſed in a proper paſte, and baked in an oven.

PATAVINITY, *Patavinitas*, among critics, denotes a peculiarity of Livy's diction, derived from Patavium, or Padua, the place of his nativity; but wherein this patavinity conſiſts, they are by no means agreed.

PATE, in fortification, a kind of platform, reſembling what is called an horſeſhoe; not always regular, but generally oval, encompaſſed only with a parapet, and having nothing to flank it. It is uſually raiſed in marſhy grounds, to cover the gate of a place.

PATE'E, or PATTE'E, in heraldry, a croſs ſmall in the center, and widening to the extremes, which are very broad.

PATELLA, in anatomy, a bone which covers the fore-part of the joint of the knee, called alſo rotula, and popularly the knee-pan. The patella is convex on the outſide, and on the inſide unequal, having an eminence and two depreſſions. Its ſubſtance is ſpungeous, and conſequently it is brittle: it is connected by tendons and ligaments to the tibia and the os femoris, which is the ligament by which it is connected to the thigh, and has a motion of aſcent and deſcent in the flexion of the tibia. In infants and children it is cartilaginous.

PATELLA, the LIMPET, is a genus of ſhell-fiſh, with a ſimple ſhell, of a conic or other gibboſe figure, and a very wide opening at the mouth or bottom; always applying itſelf firmly to ſome ſolid body, which ſerves it in the place of another ſhell: the animal inhabiting it is called limax.

PATENT, in general, denotes ſomething that ſtands open or expanded: thus a leaf is ſaid to be patent when it ſtands almoſt at right angles with the ſtalk.

PATENT, or LETTERS-PATENT. See the article LETTER.

PATENTEE, a perſon to whom the king has granted his letters patent.

PATER-NOSTER, the Lord's prayer, ſo called from the two firſt words thereof in Latin. It is alſo ſometimes uſed for a chaplet or ſtring of beads. And, in architecture, the ſame term is uſed for a ſort of ornament cut in the form of beads, either oval or round, uſed on aſtragals, baguettes, &c.

PATERNITY, the quality of a father.

PATH, in general denotes the courſe or tract marked out or run over, by a body in motion. See the article MOTION.

PATH *of the Vertex*, a term frequently uſed by Mr. Flamſteed, in his doctrine of the ſphere, for a circle deſcribed by any point of the earth's ſurface, as the earth turns round its axis; this point is conſidered as vertical to the earth's center, and is the ſame with the vertex or zenith in the ptolemaic projection.

The ſemi-diameter of this path is always equal to the ſine of the complement of the latitude of the point that deſcribes it.

PATHETIC, whatever relates to the paſſions, or that is proper to excite or awake them.

In muſic, this term is uſed for ſomething very moving, expreſſive, or paſſionate, and is capable of exciting pity, compaſſion, anger, or the like. The chromatic genus, with its greater and leſſer ſemi-tones, either aſcending or deſcending, is very proper for the pathetic; as is alſo an artful management of diſcords, with a variety of motions now briſk, now languiſhing, now ſwift, now ſlow. Nieuwentyt mentions a muſician of Venice, who excelled in the pathetic to ſuch a degree, as to be able to play his auditors into diſtraction; he adds, that the great means he made uſe of, was the variety of his motions, &c.

PATHETIC NERVES, in anatomy, a pair of very ſmall nerves which ariſe in the brain, and run to the trochlear muſcle of the eye. Theſe nerves have obtained the name pathetic, from their ſerving to move the eyes in the various paſſions.

PATHOGNOMONIC, παθωγνομονικ⊙, among phyſicians an appellation for a ſymptom, or concourſe of ſymptoms, that are inſeparable from a diſtemper, and are found in that only, and in no other.

PATHOLOGY, that part of medicine which explains the nature of diſeaſes, their cauſes and ſymptoms.

PATHOS, παθ⊙, a Greek term, literally ſignifying paſſion, is ſometimes uſed for the energy of a diſcourſe, or its power to move the paſſions.

PATIENT, among phyſicians, a perſon under the direction of a phyſician or ſurgeon, in order to be cured of ſome diſeaſe.

PATANCE, in heraldry, is a croſs flory at the ends; from which it differs only in this, that the ends, inſtead of turning down like a flour de lis, are extended ſomewhat in the pattee-form.

PATRIARCHS, among Chriſtians, are eccleſiaſtical dignitaries, or biſhops, ſo called from their paternal authority in the church.

PATRIARCHAL CROSS, in heraldry, is that where the ſhaft is twice croſſed; the lower arms being longer than the upper ones.

PATRICIAN, among the ancient Romans, a title given to the deſcendants of the hundred, or, according to others, of the two hundred firſt ſenators choſen by Romulus, and by him called *patres*, fathers.

PATRIMONY, a right or eſtate inherited by a perſon from his anceſtors.

PATRIPASSIANS, *Patripaſſiani*, in church-hiſtory, a Chriſtian ſect, who appeared about the latter end of the ſecond century; ſo called from their aſcribing the paſſion to the Father; for they aſſerted the unity of God in ſuch a manner as to deſtroy all diſtinction of perſons, and to make the Father and Son preciſely the ſame; in which they were followed by the Sabellians, and others. The author and head of the Patripaſſians was Praxeas, a philoſopher of Phrygia in Aſia.

PATROL, in war, a round or march made by the guards, or watch, in the night-time, to obſerve what paſſes in the ſtreets, and to ſecure the peace and tranquillity of a city or camp. The patrol generally conſiſts of a body of five or ſix men, detached from a body on guard, and commanded by a ſerjeant.

PATRON, among the Romans, was an appellation given to a maſter who had freed his ſlave.

Patron was alſo a name which the people of Rome gave to ſome great man, under whoſe protection they uſually put themſelves.

PATRON, in the church of Rome, a ſaint, whoſe name a perſon bears, or under whoſe protection he is put, and whom he takes particular care to invoke.

PATRON, in the canon and common law, is a perſon, who having the advowſon of a parſonage, vicarage, or the like ſpiritual promotion, belonging to his manor, hath, on that account, the gift and diſpoſition of the benefice, and may preſent to it whenever it becomes vacant.

PATRONAGE, the right of diſpoſing of a church or benefice, and enjoying ſeveral other privileges, ſuch as having the honourable rights of the church, being interred in the chancel, &c.

PATRONYMIC, among grammarians, is applied to ſuch names of men or women as are derived from thoſe of parents or anceſtors.

PAVEMENT, a layer of ſtone, or other matter, ſerving to cover and ſtrengthen the ground of divers places for the more commodious walking on.

PAVILLION, in architecture, ſignifies a kind of turret or building, uſually inſulated, and contained under a ſingle roof; ſometimes ſquare, and ſometimes in form of a dome: thus called from the reſemblance of its roof to a tent.

PAVILLION, in military affairs, ſignifies a tent raiſed on poſts to lodge under in the ſummer time.

PAVILLION, in heraldry, denotes a covering in form of a tent, which inveſts or wraps up the armories of divers kings and ſovereigns, depending only on God and their ſword.

PAVILLIONS, among jewellers, the under ſides and corners of the brilliants, lying between the girdle and the collet.

PAULIONISTS, in church hiſtory, Chriſtian heretics of the third century, diſciples of Paul Samoſatenſis, biſhop of Antioch, who denied Chriſt's divinity, maintaining that when we call him the Son of God, we do not thereby mean that he is really and truly God; but only that he was ſo perfect a man, and ſo ſuperior in virtue to all others, that he has this name given him by way of eminence. The Paulioniſts continued to the fifth century, notwithſtanding the prohibition of the emperor Conſtantine the Great, who forbad them and other heretics to hold public aſſemblies.

PAULICIANS, Chriſtian heretics of the ſeventh century, diſciples of one Conſtantine, a native of Armenia, and a favourer of the errors of Manes; who, as the name of Manichees was become odious to all nations, gave thoſe of his ſect the title of Paulicians, on pretence that they followed only the doctrine of St. Paul. One of their moſt deteſtable maxims was, not to give alms to the poor, that they might not contribute to the ſupport of creatures, who were the works of the bad god. See MANICHEES.

PAVO, in aſtronomy, a ſouthern conſtellation, called the peacock.

PAUSE, a ſtop or ceſſation of ſpeaking, ſinging, playing, or the like. The uſe of pointing in grammar, is to make proper pauſes, in certain places. There is a pauſe in the middle of each verſe; in an hemiſtich it is called a reſt or repoſe.

PAUSE, in muſic, a character of ſilence, or reſt, called alſo by ſome a mute figure; becauſe it ſhews that ſome part or perſon is to be ſilent, while the reſt continue the ſong.

PAW, PATTE, in heraldry, the fore-foot of a beaſt, cut off ſhort. If the leg be cut off, it is called gambe. Lions-paws are much uſed in armory.

PAW, in the manage. A horſe is ſaid to paw the ground, when his leg, being either tired or painful, he does not reſt upon the ground, and fears to hurt himſelf as he walks.

PAYMENT, the diſcharge of a debt, either by money really told, or by bills of exchange, &c. See the article DEBT.

PEACE, *Pax*, in its general ſignification, ſtands in contradiſtinction to war.

PEACE, in our law-books, ſignifies a quiet and inoffenſive behaviour towards the king and his people. It is obſerved, that all authority for keeping the peace comes originally from the king, who is the ſupreme officer or magiſtrate for the preſervation of it. Alſo the lord-chancellor and judges of the king's bench, &c. have a general power to keep the peace over all the realm: as have likewiſe all courts of record within their own precincts, and ſheriffs of counties, juſtices of the peace, conſtables, &c. No perſon may break the peace without being liable to puniſhment; and where any perſon is in danger of harm, or ſome bodily prejudice from another, on oath made thereof before a juſtice of the peace, or other magiſtrate, he may be ſecured by bond or recognizance, which is commonly called binding to the peace.

PEACE *of the King* is that peace or ſecurity, both of life and goods, which the king promiſes to all his ſubjects, or others that are under his protection. There is alſo the peace of the king's highways, which is to be free from all annoyances and moleſtation; to which may be added the peace of the plough, whereby both the plough and plough-cattle are ſecured from diſtreſſes; and fairs are ſaid to have their peace, ſo that no perſon may be troubled there for debts contracted elſewhere.

PEACH, *Perſica*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, being compoſed of many petals, arranged in a circular form. The piſtil ariſes from the cup, and finally becomes a fleſhy fruit of a roundiſh figure, ſulcated lengthwiſe, and containing a ſtone rough and full of irregular holes, containing an oblong kernel.

The curious in fruits account twenty-eight ſorts of peaches, but many of them ſeem very trifling diſtinctions. The fineneſs of this fruit, in general, depends on the firmneſs of the pulp, the delicacy of the flavour, and the thinneſs of the ſkin. A fine peach ſhould be of a fine deep red next the ſun, and of a pale whitiſh hue next the wall; and the pulp ſhould be of a yellow caſt, and very juicy; and the ſtone ſhould be ſmall, though the fruit in general be large.

The varieties of the peach are produced, like thoſe of the fine flowers, by ſowing the ſeeds; and, though many raiſed this way will be of little value, as is alſo the caſe in flowers, yet probably among a parcel of ſtones, ſaved from the finer kinds of peaches, there would be ſome new kinds produced; which, as they were raiſed here, would be eaſily kept up in their perfection; which is not to be expected of thoſe brought from other countries.

The beſt method of ſaving the ſtones is, to let ſome of the fineſt peaches of the beſt kinds hang till they drop of themſelves from the tree, and then the ſtones ſhould be immediately planted on a bed of light rich earth, planting them four inches deep in the earth, and at about ſix inches aſunder. The beds ſhould be covered, to preſerve them in winter; and in ſpring when the trees come up, they muſt be cleared of weeds, and well watered. The next ſpring they ſhould be carefully taken up, and planted in the nurſery at greater diſtances; and, after two or three years ſtanding here, they may be removed to the places where they are to remain; or may at that time, when the condition of their fruit is known, be grafted on other ſtocks, which is the common way now uſed to propagate theſe trees.

The

The common method of propagating the peach is, by grafting. In order to this, ſome good ſtocks ſhould be provided, which ſhould be of the muſcle, or a white pear plum. When theſe ſtocks are two or three years old, they will be ſtrong enough to bud; and the common ſeaſon for doing this is about Midſummer. The buds ſhould be choſen from a healthy tree, which produces a great deal of fruit: they muſt be taken from the trees either in a cloudy day, or elſe in the morning or evening, when the ſun has not much power; they ſhould then be inoculated on the ſtalks as ſoon as poſſible, and the ſtalks treated with the uſual care afterwards. See INOCULATION.

When theſe are to be tranſplanted where they are to remain, the moſt proper ſoil for them is a light rich paſture land, taken up with the turf, and rotted together, before it is to be uſed; and the borders to be made with this cannot be too wide, and ought to be raiſed five or ſix inches above the level of the ground; or, if the ſoil be moiſt, more than that. They muſt be tranſplanted in autumn, as ſoon as the leaves are fallen off; and ſhould never be ſet at leſs than fourteen feet diſtance from one another. The heads of the trees are then to be raiſed up againſt the walls, to keep the roots from being moved by the winds; and they ſhould be watered at times, with a noſe on the watering pot, and the water ſprinkled all over them. In the middle of May the new ſhoots are to be nailed to the wall, training them horizontally; and the foreright ſhoots are to be rubbed off: in October the new branches ſhould be pruned, ſhortening them according to the ſtrength of the tree; if ſtrong, they may be left eight inches long; if weak, they ſhould only be left five; and the ſame care is to be taken of them for the ſucceeding years.

There are two general rules always to be obſerved in the pruning of peach and nectarine trees, which are, 1. Always to have enough bearing wood. 2. Not to lay in the branches too cloſe to one another. All peach-trees produce their fruit from the young wood, either of the ſame, or, at the moſt, of the former year's ſhoot; for this reaſon the branches are to be ſo pruned, as to encourage them to throw out new ſhoots in every part of the tree: and this is to be done in May, when, by pinching, or ſtopping the ſtrong ſhoots, there may be new wood forced out in any part of the tree. This is the method of the ſummer pruning; the winter pruning is uſually done in February or March, but is much better done at Michaelmas, as ſoon as their leaves begin to fall; and the wounds will then have time to heal before the ſevere froſts come on.

In pruning of theſe trees it muſt always be obſerved alſo, that it is beſt done under a wood bud, not a bloſſom bud; which may be diſtinguiſhed by the wood buds being leſs turgid, and longer, and narrower than the bloſſom bud; for, if the ſhoot have not a leading bud where it is cut, it will commonly die down to the leading bud. In nailing the ſhoots to the wall, they ſhould be placed at as equal diſtances as poſſible, and ſo far apart that the leaves may have room; and they muſt always be trained as horizontally as poſſible, that the lower part of the tree may be well wooded, which it will not be, if the branches are ſuffered to run upright. *Miller's Gard. Dict.*

PEACOCK, *Pavo*, in ornithology, a genus of birds, of the order of the gallinæ, the characters of which are theſe: there are four toes on each foot, and the head is ornamented with an erect creſt of feathers.

Of this genus there are ſeveral ſpecies, diſtinguiſhed by their different colours. The male of the common kind is, perhaps, the moſt gaudy of all the bird kind; the length and beauty of whoſe tail, and the various forms in which the creature carries it, are ſufficiently known and admired.

PEAK, a rocky mountainous country in the weſt of Derbyſhire, remarkable for its mines of lead and iron, &c.

PEAN, in heraldry, is when the field of a coat of arms is ſable, and the powderings or.

PEAR, *Pyrus*, in botany. All the ſorts of pears, propagated in gardens, are produced by budding, or grafting them upon ſtocks of their own kind, which are commonly called tree-ſtocks, or elſe upon the quince or white-thorn ſtocks; but the laſt are now generally diſuſed, the fruit produced this way being apt to be dry and mealy. The quince ſtocks are, however, in great eſteem for the trees deſigned for dwarfs or for walls; becauſe they do not let the ſhoots grow ſo faſt and luxuriant. But there are objections againſt even theſe, which are of ſome conſequence; for there are many kinds of pear which will not do upon them, but will die, or become weak and good for nothing after three or four years; and the hard-baking pears are rendered very unpleaſant by being grafted on theſe ſtocks, while the buttery or melting ones are meliorated by them. And it is to be added, that no ſort of pear will thrive upon a quince ſtock in a poor or gravelly ſoil.

PEAR-*Trees* planted either againſt walls, or in eſpaliers, muſt not be placed nearer to one another than twenty feet. Pear-trees commonly produce their bloſſom buds firſt, at the extremity of their laſt year's ſhoots; the common way of pruning is very prejudicial, therefore, as it takes off the part which ſhould bear the fruit, and occaſions new ſhoots from the ſame branch, which will over-fill the tree with wood, the trees ſhould always be carefully looked over in ſummer, and all the foreright ſhoots taken off; by which means the fruit will not be overſhaded, and the trees will need but little winter pruning. The ſeveral ſorts of ſummer pears all ripen beſt in eſpaliers, but the winter pears require a ſouth-eaſt or ſouth-weſt, or elſe an eaſt wall. *Miller's Gard. Dict.*

PEARCH-GLUE, the name of a kind of glue of remarkable ſtrength and purity, made from the ſkins of pearches. See GLUE.

PEARL, *Margarita*, in natural hiſtory, a hard, white, ſhining body, uſually roundiſh, found in a teſtaceous fiſh reſembling an oyſter.

Pearls, though eſteemed of the number of gems by our jewellers, and highly valued, not only at this time, but in all ages, proceed only from a diſtemper in the creature that produces them, analogous to the bezoars, and other ſtony concretions in ſeveral animals of other kinds; and what the ancients imagined to be a drop of dew concreted into a pearl in the body of the pearl-fiſh, which they ſuppoſed roſe from the bottom to the ſurface of the water to receive it, is nothing more than the matter deſtined to form and enlarge the ſhell, burſting from the veſſels deſtined to carry it to the parts of the ſhell it ſhould have formed, and by that means producing theſe little concretions.

The fiſh in which theſe are uſually produced is the Eaſt Indian pearl oyſter, as it is commonly, though not very properly, called: it has a very large and broad ſhell of the bivalve-kind, ſometimes meaſuring twelve or fourteen inches over, but thoſe of eight inches are more frequent: it is not very deep; on the outſide it is of a duſky brown, and within of a very beautiful white, with tinges of ſeveral other colours, as expoſed in different directions to the light. Beſides this ſhell, there are many others that are found to produce pearls; as the common oyſter, the muſcle, the pinna marina, and ſeveral others, the pearls of which are often very good, but thoſe of the true Indian berberi, or pearl oyſter, are in general ſuperior to all. The ſmall or ſeed pearls, alſo called ounce pearls, from their being ſold by the ounce, and not by tale, are vaſtly the moſt numerous and common; but as in diamonds, among the multitude of ſmall ones, there are ſmaller numbers of larger found, ſo in pearls there are larger and larger kinds; but as they increaſe in ſize, they are proportionably leſs frequent, and this is one reaſon of their great price. We have Scotch pearls frequently as big as a little tare, ſome as big as a large pea, and ſome few of the ſize of a horſe-bean; but theſe are uſually of a bad ſhape, and of little value in proportion to their weight. Philip II. of Spain had a pearl perfect in its ſhape and colour, and of the ſize of a pigeon's egg. De Boot tells us of one in the emperor Rudolph's poſſeſſion, of thirty carrats weight; Tavernier mentions one in Perſia, for which that crown paid to the amount of more than a hundred thouſand pounds ſterling; and we are told of Cleopatra's poſſeſſing one worth fourſcore thouſand pounds of our money: pearls of ſuch vaſt ſizes as theſe are as rare as the great diamonds; but, as among diamonds,

monds, there are a conſiderable number, which though very ſhort of this, are of great value. The fineſt, and what is called the true ſhape of the pearl, is a perfect round; but if pearls of a conſiderable ſize are of the ſhape of a pear, as is not unfrequently the caſe, they are not leſs valued, as they ſerve for earings and other ornaments. Their colour ought to be a pure white, and that not a dead and lifeleſs, but a clear and brilliant one; they muſt be perfectly free from any foulneſs, ſpot or ſtain, and their ſurfaces muſt be naturally ſmooth and gloſſy, for they bring their natural poliſh with them, which art is not able to improve.

All pearls are formed of the matter of the ſhell, and conſiſt of a number of coats ſpread with perfect regularity one over another, in the manner of the ſeveral coats of an onion, or like the ſeveral ſtrata of the ſtones found in the bladders or ſtomachs of animals, only much thinner. It is obſerved that the whiteſt pearls, brought into Europe, contract a yellowneſs on the ſurface, which no art can recover; but there is a way of taking off the whole outer coat of the pearl, in which caſe the ſecond ſurface, which is as bright as the originally external one, preſerves its beauty for a long time. This, however, is a very nice operation to perform, and at beſt greatly diminiſhes the value of the pearl by taking from its ſize and weight. It is ſaid that thoſe pearls which have ſomewhat of a yellowiſh caſt never alter, nor ever loſe their luſtre; and if this be true, the ancients, who prefered thoſe which were a little yellowiſh to the perfectly white ones, had great reaſon on their ſide.

The little protuberances, like warts, which we ſee riſing in hemiſpherical figures from the ſurfaces of ſhells, are evidently of the pearl-kind, only not detached: when theſe are of a good colour, and tolerably large, our workmen cut them out, and make ſomething of them under the name of wens of pearls.

This valuable article of commerce is not the product of any peculiar part of the world. The Eaſt-Indies and America produce the pearl ſhell-fiſh in abundance, and it is found with good pearls in many parts of Europe. The coaſts of the iſland Ceylon afford pearls ſuperior to thoſe of all the Eaſt in the beauty of their colour, but there are no very large ones found there. The Perſian gulph abounds with the pearl-fiſh, and fiſheries are eſtabliſhed on the coaſts of the ſeveral iſlands in it. In America, there are fiſheries in the gulph of Mexico, and along the coaſt of Terra Firma, all which yield conſiderable advantage. The European pearls are principally found on the coaſts of Scotland, and the neighbouring parts. The pearls met with in apothecaries ſhops are of various kinds, all that are unfit for the jewellers purpoſes coming thither; conſequently ſome of the rough and ill ſhaped pearls, and thoſe of bad colours, are at times to be met with there; though the generality are what are only too ſmall for working into toys, &c. Theſe, after levigation, make an impalpable powder, which is much talked of as an ingredient in what is called pearl-cordials; but moſt of the apothecaries uſe only levigated oyſter-ſhell under its name.

Manner of fiſhing for PEARLS *in the Eaſt-Indies.* There are two ſeaſons for pearl-fiſhing, the firſt is in March and April, and the laſt in Auguſt and September; and the more rain there falls in the year, the more plentiful are theſe fiſheries. At the beginning of the ſeaſon there are ſometimes two hundred and fifty barks on the banks; the larger barks having two divers, and the ſmaller one. Each bark puts off from ſhore at ſun-riſe, with a land-breeze, which never fails; and returns again by a ſea breeze, which ſucceeds it about noon. As ſoon as the barks arrive at the place where the fiſh lie, and have caſt anchor, each diver binds a ſtone ſix inches thick, and a foot long, under his body; which ſerves him as ballaſt, prevents his being driven away by the motion of the water, and enables him to walk more ſteadily under the waves. They alſo tie another very heavy ſtone to one foot, by which they are ſpeedily ſunk to the bottom of the ſea: and as the oyſters are uſually firmly faſtened to the rocks, they arm their hands with leathern-mittens to prevent their being wounded in pulling them violently off; but this taſk ſome perform with an iron-rake. In the laſt place, each diver carries down with him a large net in the manner of a ſack, tied to his neck by a long cord, the other end of which is faſtened to the ſide of the bark. This net is to hold the oyſters gathered from the rock, and the cord is to pull up the diver when his bag is full, or he wants air. See DIVING.

In this equipage he ſometimes precipitates himſelf ſixty feet under water; and as he has no time to loſe, he no ſooner arrives at the bottom, than he begins to run from ſide to ſide, tearing up all the oyſters he meets with, and cramming them into his budget.

At whatever depth the divers are, the light is ſo great that they eaſily ſee whatever paſſes in the ſea: and to their great conſternation ſometimes perceive monſtrous fiſhes, from which all their addreſs in muddying the water, &c. will not always ſave them, but they unhappily become their prey: and of all the dangers of the fiſhery, this is one of the greateſt and moſt uſual. The beſt divers will keep under water near half an hour, and the reſt do not ſtay leſs than a quarter. During this time they hold their breath without the uſe of oils, or any other liquors; only acquiring the habit by long practice. When they find themſelves ſtreightened, they pull the rope to which the bag is faſtened, and hold faſt by it with both hands; when thoſe in the bark, taking the ſignal, heave them up into the air, and unload them of their fiſh, which is ſometimes five hundred oyſters, and ſometimes not above fifty. Some of the divers need a moment's reſpite to recover breath; others jump in again inſtantly, continuing this violent exerciſe without intermiſſion for ſeveral hours.

Manner of fiſhing for PEARLS *in America.*—The firſt to whom the Indians made this valuable diſcovery, was Baſco Nunez de Balboa, who in his paſſage for making further diſcoveries on the South-ſea, was preſented with ſome pearls by Tumaco, an Indian prince. At preſent they are found in ſuch plenty, that there are few perſons of ſubſtance near Panama, who do not employ all, or, at leaſt, part of their ſlaves in this fiſhery, the manner of which not being commonly known, it will not be improper to deſcribe it here.

The owners of the negroes employ the moſt proper perſons for this fiſhery, which being performed at the bottom of the ſea, they muſt be both expert ſwimmers, and capable of holding their breath a long time. Theſe they ſend to the iſlands, where they have huts built for their lodgings, and boats which hold eight, ten, or twenty negroes under the command of an officer. In theſe boats they go to ſuch parts as are known to produce pearls, and where the depth of the water is not above ten, twelve, or fifteen fathom. Here they come to an anchor, and the negroes having a rope faſtened round their bodies, and the other end to the ſide of the boat, they take with them a ſmall weight to accelerate their ſinking, and plunge into the water. On reaching the bottom they take up an oyſter, which they put under the left arm; the ſecond they hold in their left hand, and the third in their right; with theſe three oyſters, and ſometimes another in their mouth, they riſe to breathe, and put them in a bag. When they have reſted themſelves a while and recovered their breath, they dive a ſecond time; and thus continue, till they have either completed their taſk, or their ſtrength fails them. Every one of theſe negro divers is obliged daily to deliver his maſter a certain fixed number of pearls; ſo that when they have got the requiſite number of oyſters in their bag, they begin to open them, and deliver the pearls to the officer, till they have made up the number due to their maſter; and if the pearl be but formed, it is ſufficient, without any regard to its being ſmall or faulty. The remainder, however large or beautiful, are the negroe's own property, nor has the maſter the leaſt claim to them, the ſlaves being allowed to ſell them to whom they pleaſe, though the maſter generally purchaſes them at a very ſmall price.

Theſe negroes cannot every day make up their number, as in many of the oyſters the pearl is not at all, or but imperfectly formed, or the oyſter is dead, whereby the pearl is ſo damaged as to be of no value; and as no allowance is made for ſuch pearls, they muſt make up their number with others.

Beſides the toil of this fiſhery, from the oyſters ſtrongly adhering to the rocks, they are alſo in no ſmall danger from ſome kinds of fiſh, which either ſeize the negroes,

groes, or by ſtriking on them, cruſh them by their weight againſt the bottom. Every negro to defend himſelf againſt theſe animals, carries with him a ſharp knife, with which if the fiſh offers to aſſault him, he endeavours to ſtrike it in a part where it has no power to hurt him; on which the fiſh immediately flies. The officers keep a watchful eye on thoſe voracious creatures, and on diſcovering them, ſhake the ropes faſtened to the negroes bodies, that they may be upon their guard; many, on the divers being in danger, have thrown themſelves into the water, with the like weapon, and haſten down to their defence: but too often all their dexterity and precaution is not ſufficient to protect the diver from being devoured by theſe fiſh, or loſing one of his legs or arms by their bite. Several ſchemes have been practiſed to prevent ſuch melancholy accidents; but they have hitherto proved very ineffectual.

The pearls of theſe fiſheries are generally of a good water, and ſome very remarkable both in their ſhape and ſize; but there is a difference in their water and colour; ſome being highly valuable, and others as remarkably defective. Some of theſe pearls, though indeed but few, are ſent to Europe, the greateſt part being carried to Lima; where the demand for them is very great, being not only univerſally worn there by all perſons of rank, but alſo ſent from thence into the inland parts of Peru.

Mother of PEARL is the ſhell, not of the pearl oyſter, but of another ſea-fiſh of the oyſter kind. This ſhell on the inſide is extremely ſmooth, and of the whiteneſs and water of pearl itſelf; and it has the ſame luſtre on the outſide, after the firſt laminæ or ſcales have been cleared off with aqua-fortis, and the lapidaries mill. Mother of pearl is uſed in inlaid-works, and in ſeveral toys, as ſnuff-boxes, &c.

PEARL, in heraldry, in blazoning with precious ſtones, is the ſame with argent, or white.

PEARL, PIN, or WEB, in medicine, an excreſcence growing in the eye.

PEARL-FISH, *Rhombus*. See RHOMBUS.

PEARL-FORT, a fortreſs in Dutch Brabant, ſituated on the river Scheld, four miles north-weſt of Antwerp.

PEAT, a kind of turf uſed for fuel in ſeveral countries.

In Holland they have a way of charring peats ſo that it may ſerve for fuel in ſeveral chemical operations; but this manner of charring is not yet known in ſeveral countries where, perhaps, peat might be found.

PEBBLES, *Calculi*, ſmall ſtones, compoſed of a cryſtaline matter debaſed by earths, and hence ſubject to veins, clouds, and other variegations.

PECCANT, in medicine, a term uſed for thoſe humours of the body which offend either by their quantity or quality.

PECK, a meaſure of capacity, four of which make a buſhel.

PECTORAL, an epithet for medicines good for diſorders of the breaſt and lungs. The ordinary intention of theſe medicines is either to attenuate or thicken the humours of theſe parts, and to render them fit to be expectorated or ſpit out.

PECTORALIS, in anatomy, a pair of muſcles which poſſeſſes almoſt all the whole breaſt, and ſerves to move the arm forwards. This muſcle has its origin in the clavicle, the ſternum, and all the true ribs, and its termination at four fingers breadth below the head of the humerus. Its action is probably much aſſiſted by the action of the coraco-brachialis, and that of the deltoides by that of the upper part of this pectoral muſcle, which is uſually a kind of diſtinct muſcle. Naturaliſts obſerve a ſingular mark of providence, in the ſize and ſtrength of the pectoral muſcle in different animals. It is by the action of this muſcle, that the flying of birds is chiefly performed; and therefore much larger and ſtronger in birds, than in any animals not made for flight.

PECULIAR, in the canon law ſignifies a particular pariſh or church that has juriſdiction within itſelf for granting probates of wills, and adminiſtrations, exempt from the ordinary or biſhop's courts. The king's chapel is a royal peculiar, exempt from all ſpiritual juriſdiction, and reſerved to the viſitations and immediate government of the king himſelf. There is likewiſe the archbiſhop's peculiar; for it is an ancient privilege of the ſee of Canterbury, that wherever any manors or advowſons belong to it, they forthwith become exempt from the ordinary, and are reputed peculiars: there are fifty-ſeven ſuch peculiars in the ſee of Canterbury.

Beſides theſe, there are ſome peculiars belonging to deans, chapters and prebendaries, which are only exempted from the juriſdiction of the archdeacon; theſe are derived from the biſhop, who may viſit them, and to whom there lies an appeal.

Court of PECULIARS, is a court in which the affairs belonging to peculiars are tranſacted.

PEDAGOGUE, or PÆDAGOGUE παιδαγωγος, a tutor or maſter, to whom is committed the diſcipline and direction of a ſcholar, to be inſtructed in grammar and other arts.

PEDALS, the largeſt pipes of an organ, ſo called becauſe played and ſtopped with the foot. The pedals are made ſquare, and of wood; they are of modern invention, and ſerve to carry the ſounds an octave deeper than the reſt. See ORGAN.

PEDANEUS, in the civil law, a petty judge who has no formal ſeat of juſtice, but hears cauſes ſtanding, and without any tribunal.

PEDANT, is uſed for a rough unpoliſhed man of letters, who makes an impertinent uſe of the ſciences, and abounds in unſeaſonable criticiſms and obſervations. Dacier defines a pedant, a perſon who has more reading than good ſenſe; and Malebranche deſcribes him, as a man full of falſe erudition, who makes a parade of his knowledge, and is ever quoting ſome Greek or Latin author, or hunting back to a remote etymology: hence,

PEDANTRY, the quality or manner of a pedant.

PEDESTAL, in architecture, the loweſt part of an order of columns, being that which ſuſtains the column, and ſerves it as a foot or ſtand.

The pedeſtal conſiſts of three principal parts, viz. a ſquare, trunk, or dye, which makes the body; a corniche, the head; and a baſe, the foot of the pedeſtal. The pedeſtal is properly an appendage to a column, not an eſſential part of it; though M. Le Clerc thinks it eſſential to a complete order.

There are as many kinds of pedeſtals as there are of orders of columns, viz. the Tuſcan, Doric, Ionic, Corinthian, and Compoſite: ſome ſay the height of the pedeſtal in each order, ought to be a third part of the whole column, comprehending the baſe and capital, and their proper adjuncts, as architrave, frieze, and corniche, a fourth part of the ſame pillar. Indeed Vignola, and moſt of the moderns, make the pedeſtal and all its ornaments in all the orders one third of the height of the column, including the baſe and capital; but ſome deviate from this rule. See BASE, &c.

The whole height of the Tuſcan column, comprehending the architrave, frieze and corniche, being divided into nine parts, two of theſe, according to Vitruvius, go to the height of the pedeſtal; which is by him deſcribed in two different forms, one of which is plain, having only a plinth for the baſe, and another for the capital: the height of each of theſe plinths is one ſixth of the whole height of the pedeſtal, and the projecture of theſe plinths is one ſixth of their height. In the pedeſtal that he deſcribes of the other form, he alſo divides the whole height of the pedeſtal into ſix parts, one of which goes to the baſe, and one to the capital. Palladio and Scamozzi make the Tuſcan pedeſtal three modules high, Vignola five. See TUSCAN.

For the proportion of the Doric pedeſtal, ſee the article DORIC.

And for the proportions of the Ionic pedeſtal, ſee the article IONIC.

The Corinthian pedeſtal is the richeſt and moſt delicate of all. The proportions of this pedeſtal are alſo given already under the article CORINTHIAN-ORDER.

Vitruvius divides the whole height of the Compoſite column into thirteen parts, making the height of the pedeſtal three of thoſe parts. Vignola makes the Compoſite pedeſtal of the ſame height with the Corinthian, viz. ſeven modules; Scamozzi, ſix modules two minutes; Palladio, ſix modules ſeven minutes; in the goldſmith's arch, ſeven modules eight minutes. Its members in Vignola

Vignola are the ſame with thoſe of the Corinthian, but with this difference, that whereas theſe are moſt of them enriched with carvings in the Corinthian, they are all plain in the Compoſite, and there is alſo a difference in the profiles of the baſe and corniche in the two orders. Daviler obſerves, that the generality of architects uſe tables or pannels, either in relievo or creux in the dyes of pedeſtals, without any regard to the character of the order: thoſe in relievo he obſerves are only ſuitable to the Tuſcan and Doric; the three others muſt be indented, which he ſays is a thing the ancients never practiſed, as being contrary to the rules of ſolidity and ſtrength.

Pedeſtals acquire other denominations, as thoſe following: 1. Square pedeſtal, is that whoſe height and width are equal, as that of the arch of the lions at Verona, of the Corinthian order; and ſuch ſome followers of Vitruvius, as Serlio, Philander, &c. have given to their Tuſcan orders. 2. Double pedeſtal, is that which ſupports two columns, and has more breadth than height. 3. Continued pedeſtal, is one which ſupports a row of columns without any break or interruption, as thoſe which ſuſtain the fluted columns of the palace of the Thuilleries, on the garden ſide.

PEDESTALS *of Statues*, are ſuch as ſerve to ſupport ſtatues of figures. Vignola obſerves, that there is no part of architecture more arbitrary, and in which more liberty may be taken, than in the pedeſtals of ſtatues; there being no rules or laws preſcribed by antiquity, nor any ſettled even by the moderns. There being then no ſettled proportion for theſe pedeſtals, the height depends on the ſituation, and the figure that they ſuſtain: when on the ground, the pedeſtal is uſually two thirds or two fifths of that of the ſtatue; the more maſſive the ſtatue is, the ſtronger the pedeſtal muſt be. Their form and character, &c. are to be extraordinary and ingenious, far from the regularity and ſimplicity of the pedeſtals of columns. The ſame author gives a multiplicity of forms, as oval, triangular, multangular, &c.

PEDIÆUS, in anatomy, the ſecond of the extenſor-muſcles of the foot, having its origin in the lower part of the perone and annular ligament; and being divided into four tendons, which are inſerted into the external part of the firſt articulation of the four toes. Its uſe is to extend the foot, together with the firſt of the extenſors, called the extenſor communis.

PEDICLE, among botaniſts, that part of a ſtalk which immediately ſuſtains the leaf of a flower or a fruit, and is common' called a foot-ſtalk.

PEDICULUS, LOUSE, in zoology, a genus of inſects, the body of which is lobated at the ſides; the legs are ſix, ſerving only for walking; and the eyes are two, and are ſimple.

Moſt animals are infeſted with lice, or inſects which feed upon them: thus ſheep have one ſpecies, oxen another, &c. and mankind are not free from them; for beſides the common kind, whoſe natural habitation is in the heads of children, there is another kind called the crab-louſe, whoſe natural reſidence is about the pubes. Authors alſo reckon the death-watch among the number of lice.

PEDILUVIUM, a bathing of the feet. This bath may be prepared of the ſame ingredients with other baths. It may either conſiſt of light, pure water alone; or, to correct the qualities of heavy and hard water, a lixivium or bran of wheat or chamomile-flowers may be added.

Pediluvium is highly expedient for the purpoſes of derivation in thoſe diſeaſes which ariſe from congeſtions of the humours to the head and breaſt, produced by ſpaſms of the inferior parts, and eſpecially of the hypochondria. Among this kind, beſides lethargic diſeaſes, we may reckon almoſt all diſorders of the head, ſuch as madneſs, melancholy, cephalæas, hemicranias, the clavus hyſtericus, vertigo's, toothachs, pains of the ears, a gutta roſacea; inflammations and defluxions of ſaline humours on the eyes; immoderate hæmorrhages from the noſe, and long watchings. Of this kind are alſo ſome diſorders which affect the breaſt, ſuch as convulſive aſthmas, dyſpnœas ariſing from a plethora, palpitations of the heart, dry coughs, and ſpittings of blood. Beſides, baths for the feet in conſequence of their ſingular efficacy in relaxing ſpaſms, are highly beneficial in ſpaſmodic and convulſive diſorders, in pains, cardialgias, colics, eſpecially of the hæmorrhoidal kind, gripes produced by the ſtone, and inflations of the ſtomach.

It is to be obſerved, that pediluvium produces more happy effects, if before it is uſed the quantity of blood is leſſened by veneſection in the feet: it ſhould be uſed about bed-time; and the feet kept warm till the patient goes to bed, by which means perſpiration all over the body is increaſed.

PEDIGREE. See the article DESCENT.

PEDIMENT, in architecture, is a kind of low pinnacle, ſerving to crown an ordonnance, or finiſh a frontiſpiece, and is placed as an ornament over gates, doors, windows, niches, altars, &c. being ordinarily of a triangular form, but ſometimes forming an arch of a circle. The parts of a pediment are the tympanum and the corniche, which crowns it, and the entablature, which ſerves it as a baſe, or ſcale. Architects have taken a great deal of liberty in the form of this member; nor do they vary leſs as to the proportion of the pediment. The moſt beautiful, according to Daviler, is that where its height is about one fifth of the length of its baſe.

The pediment is uſually triangular, and ſometimes an equilateral triangle, called alſo a pointed pediment; it is ſometimes circular, though M. Felibien obſerves, that we have no inſtance of round pediments in the antique, beſides thoſe in the chapels of the rotundo. Sometimes its upper corniche is divided into three or four ſides, or right lines: ſometimes the corniche is cut or open a-top, which is an abuſe introduced by the moderns, particularly Michael Angelo; for the deſign of this part over doors, window, &c. being chiefly to ſhelter thoſe underneath from the rain, to leave it open in the middle is to fruſtrate its end. Sometimes the pediment is formed of a couple of ſcrolls or wreaths like two conſoles joined together; ſometimes again it is without a baſe, or its lower corniche is cut out, all but what is beſtowed on two columns or pilaſters, and on theſe is raiſed an arch or ſweep, inſtead of an entablature, of which Serlio gives an inſtance in the antique in a Corinthian gate at Foligny, in Umbria; and Daviler a modern one in the church of St. Peter at Rome.

Under this kind of pediments come thoſe little arched corniches, which form pediments over doors and windows, ſupported by two conſoles, inſtead either of entablature or columns.

Sometimes the pediment is made double, i. e. a leſs pediment is made in the tympanum of a larger, on account of ſome projecture in the middle, as the frontiſpiece of the church of the Great Jeſus at Rome; but this is accounted an abuſe in architecture, though authoriſed by very good buildings, as the large pavilion of the Louvre, where the caryatides ſupport three pediments, one in another: ſometimes the tympanum of the pediment is cut out, or left open to let in light, as is ſeen under the portico of the capitol at Rome; laſtly, this open pediment is ſometimes triangular, and enriched with ſculpture, as roſes, leaves, &c. as is found in moſt of the Gothic churches.

M. Le Clerc obſerves, that the modillions in the corniche of the pediment ſhould always anſwer exactly over thoſe of the entablature. Indeed Vitruvius ſays, that the ancients did not allow of any modillions at all in pediments. M. Le Clerc alſo obſerves, that the corniche which ſerves the pediment as a baſe, ſhould have no cymatium, by reaſon the cymatium of the reſt of the entablature, when it meets the pediment, paſſes over it. This change of determination occaſions a conſiderable difficulty; the cymatium in this caſe appearing too broad in the turn of the angle, to remedy which, architects have recourſe to ſeveral expedients.

A pointed pediment may crown three arches, but a circular pediment can only crown agreeably. There ſhould never be uſed more than two tympana over each other in the ſame frontiſpiece, and even where there are two, it would be proper to have the lower circular, and the upper pointed.

PEDOMETER, or PODOMETER, the ſame with perambulator. See PERAMBULATOR.

PEDRERO, PETERERO, or PATERERO, a ſmall piece of ordnance, uſed on board ſhips, for the diſcharging

jng of nails, broken iron, or partridge ſhot, on an enemy attempting to board. See ORDNANCE.

They are generally open at the breech, and their chamber made to take out, to be loaded that way, inſtead of at the muzzle.

PEDUNCLE, among botaniſts, the ſame with pedicle. See PEDICLE.

PEDUNCULI CEREBELLI, in anatomy, three medullary proceſſes of the cerebellum, whereby that part is joined to the medulla oblongata.

The firſt of theſe proceſſes aſcends from the cerebellum towards the teſtes, and forms what is called the valvula magna of the brain; the ſecond forms the annular prominence of Willis; and the third deſcends to the ſpinal marrow.

PEE, in mining, is uſed for the place where two veins meet and croſs one another.

PEER, in general, ſignifies an equal, or one of the ſame rank and ſtation.

The term peers is now applied to thoſe who are impannelled in an inqueſt upon a perſon for convicting or acquitting him of any offence laid to his charge; and the reaſon why the jury is ſo called, is, becauſe by the common law, and the cuſtom of this kingdom, every perſon is to be tried by his peers or equals, a lord by the lords, and a commoner by commoners.

PEER *of the Realm*, a noble lord who has a ſeat and vote in the houſe of lords, which is alſo called the houſe of peers. Theſe lords are called peers, becauſe, though there is a diſtinction of degrees in our nobility, yet in public actions they are equal, as in their votes in parliament, and in trying any nobleman or other perſon impeached by the commons, &c. See the article PARLIAMENT.

PEERESS, a woman who is noble by deſcent, creation, or marriage.

PEGASUS, among the poets, a horſe imagined to have wings, being that whereon Bellerophon was fabled to be mounted, when he engaged the chimæra.

The opening of the fountain Hippocrene, on mount Helicon, is aſcribed to a blow of Pegaſus's hoof. Pegaſus was feigned to have flown away to heaven, where it became a conſtellation.

PEGASUS, in aſtronomy, a conſtellation of the northern hemiſphere, in form of a flying horſe, ſaid by different authors to contain nineteen, twenty, and ninety-three ſtars.

PELAGIANS, a Chriſtian ſect who appeared about the latter end of the fourth, or the beginning of the fifth century.

Pelagius, the author of this ſect, was born in Wales, and his name was Morgan, which in the Welſh language ſignifies *ſea-born*; from whence he had his Latin name Pelagius. Some of our ancient hiſtorians pretend that he was abbot of Bangor; but this is impoſſible, becauſe the Britiſh monaſteries were of a later date. St. Auſtin gives him the character of a very pious man, and a Chriſtian of no vulgar rank: according to the ſame father, he travelled to Rome, where he aſſociated himſelf with perſons of the greateſt learning and figure; and wrote his commentaries on St. Paul's Epiſtles, and his letters to Melania and Demetrias; but being charged with hereſy, he left Rome, and went into Africa, and from thence to Jeruſalem, where he ſettled. He died ſomewhere in the eaſt, but where is uncertain. He was charged with maintaining the following doctrines: 1. That Adam was by nature mortal, and whether he had ſinned or not, would certainly have died. 2. That the conſequences of Adam's ſin were confined to his own perſon. 3. That new-born infants are in the ſame condition with Adam before the fall. 4. That the law qualified men for the kingdom of heaven, and was founded upon equal promiſes with the goſpel. 5. That the general reſurrection of the dead does not follow in virtue of our Saviour's reſurrection. 6 That the grace of God is given according to our merits. 7. That this grace is not granted for the performance of every moral act; the liberty of the will, and information in points of duty, being ſufficient, &c. Pelagius's ſentiments were condemned by ſeveral councils in Africa, and by a ſynod at Antioch.

There was alſo a ſect of ſemi-pelagians: who, with the orthodox, allowed of original ſin; but denied that the liberty of the will could be ſo far impaired thereby, that men could not of themſelves do ſomething, which might induce God to afford his grace to one more than another: and as to election, they held, that it depended on our perſeverance; God chooſing only ſuch to eternal life, as continued ſtedfaſt in the faith.

PELECOIDES, in geometry, a figure in form of an hatchet; ſuch is the figure B C D A, plate XCVIII. *fig.* 3. contained under the two inverted quadrantal arcs A B and A D, and the ſemi-circle B C D. The area of the pelecoides is demonſtrated to be equal to the ſquare A C, and that again to the parallelogram E B. It is equal to the ſquare A C, becauſe it wants of the ſquare on the left hand the two ſegments A B and A C, which are equal to the two ſegments B C and C D, by which it exceeds on the right hand.

PELICAN, *Pelicanus*, in ornithology, a genus of birds, of the order of the anſeres, the beak of which is very long, crooked, and unguiculated at the extremity: its ſides are not denticulated, and the anterior part towards the head is naked.

PELICAN, in chemiſtry, a kind of double veſſel, generally made of glaſs, and uſed in extracting tinctures by circulation: it conſiſts of a cucurbit and alembic-head, with two tubes bending into the cucurbit again. See plate XXXIX. *fig.* 4.

PELLETS, in heraldry, are thoſe roundles of a black colour, called alſo ogreſſes and gum-ſtones.

PELLICLE, a thin ſlim, or fragment of a membrane.

PELLUCID, the ſame with diaphanous or tranſparent, and ſtands oppoſed to opaque. See TRANSPARENT.

PELVIS, the inferior part of the cavity of the abdomen, ſo called from its reſembling a baſon or ewer, in Latin called pelvis. See ABDOMEN.

PELVIS *of the Kidneys*, a membranaceous cavity in the kidneys, which receives the urine, and conveys it to the ureters.

PENANCE, a puniſhment either voluntary or impoſed by authority for the faults a perſon has committed.

PENATES, in Roman antiquity, were a kind of tutelar deities, either of countries or particular houſes; in the latter ſenſe they were the ſame with the lares.

PENCIL, an inſtrument uſed by painters for laying on colours. Pencils are of various kinds, and made of various materials, the larger of boars-briſtles, the thick end of which are bound to a ſtick; bigger or leſs according to the uſes they are deſigned for: theſe, when large, are called bruſhes. The finer ſorts of pencils are made of camels, badgers, and ſquirrels hair, and of the down of ſwans; theſe are tied at the upper end with a piece of ſtrong thread, and incloſed in the barrel of a quill.

All good pencils on being drawn between the lips come to a fine point.

PENCIL is alſo an inſtrument uſed in drawing, &c. made of long pieces of black-lead, or red-chalk, placed in a groove cut in a ſlip of cedar, on which other pieces of cedar being glued, the whole is planed round, and one of the ends being cut to a point, it is fit for uſe.

PENDANT, an ornament ſuſpended to the ear, frequently conſiſting of diamonds, pearls, and other precious ſtones.

PENDANTS, in heraldry, are parts hanging down from the label, to the number of two, three, four, five, or ſix at moſt, reſembling the drops in the Doric frieze. When they are more than three, they muſt be ſpecified in the blazoning.

PENDANT *Feathers*, among falconers, are thoſe feathers that grow behind the thighs of an hawk.

PENDANTS, among floriſts, the ſame with apices or antheræ. See APICES.

PENDENTIVE, in architecture, the whole body of a vault ſuſpended out of the perpendicular of the walls, and bearing againſt the arch boutants; or according to Daviler, it is the portion of a vault between the arches of a dome, uſually enriched with ſculpture.

PENDULOUS, a term applied to any thing that bends or hangs downwards: thus, the flowers, whoſe ſlender

ſlender ſtalks are not able to ſuſtain their heads upright, are called pendulous flowers. See the articles BOTANY and FLOWER.

PENDULUM, in mechanics, any heavy body ſo ſuſpended, as that it may vibrate backwards and forwards, about ſome fixed point, by the force of gravity.

The word is derived from the Latin *pendeo*, to hang, or be ſuſpended.

A pendulum is any body, as B (plate XCVIII. *fig.* 4.) ſuſpended upon, and moving about a point A as a center. The nature of a pendulum conſiſts in the following particulars: 1. The times of the vibrations of a pendulum, in very ſmall arches are all equal. 2. The velocity of the bob, in the loweſt point, will be nearly as the length of the chord of the arch which it deſcribes in the deſcent. 3. The times of vibration in different pendulums, A B, A C, are directly as the ſquare roots of their lengths. 4. The time of one vibration is to the time of the deſcent, through half the length of the pendulum, as the circumference of a circle to its diameter. 5. The quantity of matter in the pendulous body is as the weight and the ſquare of the time directly, and the length of the pendulum inverſely. 6. Whence the length of a pendulum, vibrating ſeconds, will be found 39 inches nearly; and of one half ſecond pendulum nine, eight inches.

From theſe properties of the pendulum we may diſcern its uſe as an univerſal chronometer, or regulator of time, as it is uſed in clocks, and ſuch-like machines. By this inſtrument alſo we can meaſure the diſtance of a ſhip, by meaſuring the interval of time between the fire and the ſound of the gun; alſo the diſtance of a cloud, by numbering the ſeconds, or half-ſeconds, between the lightning and thunder. Thus, ſuppoſe between the lightning and thunder, we number 10 ſeconds; then, becauſe ſound paſſes through 1142 feet in one ſecond, we have the diſtance of the cloud equal to 11420 feet. Again, the height of any room, or other object, may be meaſured by a pendulum vibrating from the top thereof. Thus, ſuppoſe a pendulum from the height of a room vibrates once in three ſeconds; then ſay, as 1 is to the ſquare of 3, viz. 9, ſo is 39,2 to 352,8 feet, the height required. Laſtly, by the pendulum we diſcover the different force of gravity on diverſe parts of the earth's ſurface, and thence the true figure of the earth. See the article EARTH.

The greateſt inconvenience attending this moſt uſeful inſtrument is, that it is conſtantly liable to an alteration of its length, from the effects of heat and cold, which very ſenſibly expand and contract all metalline bodies, as is evident from the pyrometer. See the article PYROMETER.

When pendulums were firſt applied to clocks, they were made very ſhort; and the arches of the circle being large, the time of vibration, through different arches, could not in that caſe be equal; to effect which, the pendulum was contrived to vibrate in the arch of a cycloid.

From what has been ſaid under the article CYCLOID, it appears that if AC (plate XCVIII. *fig.* 5.) be the length of a pendulum ſo diſpoſed, as to vibrate between the two ſemicycloids A D and A L, the bob will deſcribe in its motion the cycloid D C L. The properties of which motion will now eaſily appear: for, with reſpect to the velocity acquired by deſcending through any arch R C or B C, it is always as $\sqrt{OC}$ which is as the chord S C $= \frac{1}{2}$ R C; conſequently the velocity at C is every-where as the ſpace paſſed through, or as the arch of the cycloid deſcribed in the deſcent.

But ſince it is always S = T V, in all kinds of motion; if in any caſe S be as V, it is evident T muſt be a given quantity, or always the ſame. That is, when the ſpaces (S, s,) are as the velocities (V, v,) the times (T, t,) will be always equal; and, therefore, all the arches of a cycloid, great or ſmall, are deſcribed in equal times. Alſo the time of vibration in the cycloid is to the time of deſcent through half its length, as the circumference of a circle to its diameter.

If A C be the length of a pendulum vibrating ſeconds, it may be eaſily found, ſince it is known by moſt accurate experiments, that a body deſcends freely by gravity through 193$\frac{1}{2}$ inches in the firſt ſecond of time; therefore by making this analogy, as $3{,}14159^2 : 1^2 :: 193\frac{1}{2} : 19{,}6 = AK$, and ſo AC = 39,2 inches, the length of a ſecond pendulum, as required. And, ſince the lengths are as the ſquares of the times of vibrations, we have 4 : 1 :: 39,2 : 9,8 inches, the length of an half-ſecond pendulum.

Since the length of a pendulum A C, for vibrating ſeconds, is ſo conſiderable, the bob, without the cycloidal cheeks A L and A D, will indeed deſcribe the arch of a circle, as fC e, when it vibrates; but then this circular arch will, for ſome diſtance on each ſide the loweſt point C, coincide with the cycloid very nearly, as, for example, to g and h; and hence it follows, that a common pendulum, vibrating through very ſmall arches g, h, will perform all its vibrations in equal times. And hence the above-mentioned cycloidal cheeks came into diſuſe.

Hence the time of deſcent through the arch Cg of the cycloid is to the time of deſcent through the diameter of the generating circle, as $\sqrt{4a}$ (ſuppoſing A C = 2 a) multiplied by $\frac{3{,}14159}{4} = 0{,}7854$, to $\sqrt{a}$.

In all that has been hitherto ſaid the power of gravity has been ſuppoſed conſtantly the ſame. But, if the ſaid power varies, the lengths of pendulums muſt vary in the ſame proportion, in order that they may vibrate in equal times; for we have ſhewn, that the ratio of the times of vibration and deſcent through half the lengths is given, and conſequently the times of vibration and deſcent through the whole length is given. But the times of vibration are ſuppoſed equal, therefore the times of deſcent through the lengths of the pendulum are equal. But bodies deſcending through unequal ſpaces, in equal times, are impelled by powers that are as the ſpaces deſcribed, that is, the powers of gravity are as the lengths of the pendulums. See VIBRATION.

PENETRATION, the act whereby one thing takes the place of another, or has its extenſion in the ſame part of ſpace before poſſeſſed by the other.

PENGUIN, in ornithology, the name of a ſea-bird common on the coaſts of America, eſpecially about the banks of Newfoundland, and the iſlands about the Streights of Magellan. It has eight furrows on the beak, and white ſpots before the eye; is a very ſingular bird, and about the ſize of a gooſe.

PENIS, the YARD, in anatomy, the primary organ of generation in man; being called alſo mentula, virgo, priapus, and by a multitude of other names.

Anatomiſts divide the penis into three parts, the body, the glans, and the urethra. In the body of the penis, are obſervable the cuticle and cutis, as the common integuments; the prepuce, being a reduplication of the cutis covering the glans; and in the lower of this is fixed the frenulum, all which are deſcribed under their ſeveral heads.

After theſe is obſervable the proper teguments or coats of the penis. This is a robuſt coat, of a membranous nature, ſurrounding every part of the penis. It is ſometimes double, and has in the interſtitial ſpace a celluloſe coat which is diſcoverable by inflation and drying in that ſtate. Under this are the two bodies which conſtitute the penis; theſe, being called the corpora cavernoſa, or ſpongioſa, are deſcribed under the article CAVERNOSE.

PENITENCE, properly ſignifies the ſame with repentance; but is alſo uſed for the diſcipline or puniſhment, uſually called penance.

PENITENTS, an appellation given to certain fraternities of penitents diſtinguiſhed by the different ſhape and colour of their habits.

PENNY, in commerce, an ancient Engliſh coin, which is now generally a money of account.

It was equal in weight to our threepence; five of which made a Saxon ſcilling, and thirty a mark, or mancuſe, equal to our ſeven ſhillings and ſixpence.

Till the time of Edward I. the penny was ſtruck with a croſs, ſo deeply indented, that it might be eaſily broke into two, thence called half pennies, or into four, called four things, or farthings: but that prince coined it without indenture, and ſtruck round the halfpence and farthings. He alſo ordered that the penny ſhould weigh

thirty-two grains of wheat, and called it the penny ſterling, twenty of which were to weigh an ounce.

At preſent a penny, bating a few ſilver pence current among us, is only a money of account, containing the twelfth part of our ſhilling, or the two hundred and fortieth part of a pound.

PENNY-EARTH, in agriculture, denotes a hard, loamy, or ſandy earth, with a large proportion of ſea-ſhells intermixed with it.

PENNY-ROYAL, *Pulegium*, in botany. See the article PULEGIUM.

PENNY-WEIGHT, a Troy weight, containing twenty-four grains, each of which is equal in weight to a grain of wheat, gathered out of the middle of the ear, and well dried. See WEIGHT.

PENSION, a ſum of money paid annually for ſervices or conſiderations already paſt.

PENSIONARY, or PENSIONER, a perſon who has an appointment, or yearly ſum, payable during life, by way of acknowledgment, charged on the eſtate of a prince, company, or particular perſon.

Grand PENSIONARY, an appellation given to the firſt miniſter of the ſtates of Holland.

PENSIONARY, is alſo the firſt miniſter of the regency of each city in Holland.

PENSIONER, in general, denotes a perſon who receives a penſion, yearly ſalary, or allowance.

PENTACROSTIC, in poetry, a ſet of verſes ſo diſpoſed as that there are always five acroſtics of the ſame name, in five diviſions of each verſe. See the article ACROSTIC.

PENTAGON, in geometry, a figure of five ſides and five angles.

The word is Greek, and compounded of πεντε, five, and, γωνια, angle.

If the five ſides be equal, and alſo the angles, the figure is called a regular pentagon as (plate XCVIII. *fig.* 6.)

The moſt conſiderable property of a regular pentagon is, that one of its ſides D E is equal in power to the ſides of a hexagon, and a decagon, inſcribed in the ſame circle A B C D E, that is, the ſquare of the ſide D E, is equal to the ſum of the ſquares of the ſides D *a* and D *b*.

Pappus has alſo demonſtrated, that twelve regular pentagons contained more than twenty equilateral triangles inſcribed in the ſame circle, *lib.* 5. *probl.* 45.

The dodecahedron, which is the fourth regular ſolid, conſiſts of twelve pentagons.

PENTAGRAPH, or PARALLELOGRAM, an inſtrument whereby deſigns of any kind may be copied in what proportion you pleaſe, without being ſkilled in drawing.

It conſiſts of four braſs or wooden rulers, (plate XCVIII. *fig.* 7.) two of them from fifteen to eighteen inches long; the other two, half that length. At the ends and middle of the long rulers, as alſo at the ends of the ſhorter, are holes, upon the exact fixing whereof, the perfection of of the inſtrument chiefly depends. Thoſe in the middle of the long rulers are to be at the ſame diſtance from thoſe at the ends of the long ones, and thoſe of the ſhort ones, ſo as to form a parallelogram.

It is fitted together by a large pillar *a*, having at one end a ſcrew and nut, whereby the two long rulers are joined, and at the other a little knot for the inſtrument to ſlide on: *b* is a rivet with a ſcrew and nut, wherewith each ſhort ruler is faſtened to the middle of each long one: *c* is a pillar, one end whereof, being hollowed into a ſcrew, has a nut fitted to it; at the other end is a worm to ſcrew into the table; when the inſtrument is to be uſed, it joins the ends of the two ſhort rulers: *d* is a pen or pencil ſcrewed into a little pillar: *e* is a braſs-point, moderately blunt, ſcrewed, likewiſe, into a little pillar.

Uſe of the PENTAGRAPH. 1. To copy a deſign in the ſame ſcale as the original: ſcrew the worm *c* into the table; lay a paper under the pencil *d*, now placed at *f*, and the deſign under the point *e*, now placed at *g*; then, conducting the point over the ſeveral lines of the deſign, the pencil *f* will draw the ſame on the paper. 2. If the deſign be to be reduced into half, &c. the ſpace, the worm muſt be placed at the end of the long ruler *d*, and the paper and pencil in the middle. In this ſituation conduct the braſs-point as before, and the pencil will draw its copy in the proportion required, the pencil here moving half the length that the point does.

On the contrary, if the deſign be to be enlarged by one half, the braſs point, with the deſign, muſt be placed in the middle at *c*, the pencil and paper at the end of the long ruler, and the worm at the other.

3. To enlarge or reduce in other proportions, there are holes drilled at equal diſtances on each ruler, namely, all along the ſhort one, and half way the long ones, in order for placing of the braſs-point, pencil, and worm, in a right line therein; that is, if the piece carrying the point be put in the third hole, the two other pieces muſt be put in its third hole.

If then the point and deſign be placed at any hole of the great ruler, and the pencil with the paper at any hole of the ſhort ruler, which forms the angle therewith, the copy will be leſs than half the original. On the contrary, if it be placed at one of the holes of that ſhort ruler, which is parallel to the long ruler, the copy will be greater than half the original.

Few of theſe inſtruments will do any thing tolerably but ſtraight lines, and many of them not thoſe.

PENTAMETER, in ancient poetry, a kind of verſe conſiſting of five feet, or metres; whence the name.

The two firſt feet may be either dactyls or ſpondees, at pleaſure; the third is always a ſpondee, and the two laſt anapeſts.

PENTANDRIA, in botany, one of Linnæus's claſſes of plants, the fifth in order; the characters of which are that all the plants comprehended in it have hermaphrodite flowers, with five ſtamina or male parts in each: they are ſubdivided into orders, which are denominated *monogynia*, *digynia*, *trigynia*, &c. according as there are one, two, three, &c. piſtils, or female parts, in each flower. See STAMINA.

To this genus belongs the vine, of the order of the *monogynia*; the elm, of the *digynia*; ſumach, of the *trigynia*, &c.

PENTAPETALOUS, an appellation given to flowers that conſiſt of five petals or leaves.

PENTAPTOTON, in grammar, denotes a noun which has only five caſes.

PENTASTICH, πεντασιχον, in poetry, a ſtanza, or diviſion of a poem, conſiſting of five verſes; whence the name.

PENTASTYLE, in architecture, a building wherein there are five rows of columns. See the article COLUMN.

PENTATEUCH, πεντατευχος, an appellation given to the firſt five books of the Old Teſtament, viz. Geneſis, Exodus, Leviticus, Numbers, and Deuteronomy.

The Samaritans acknowledge no other ſcriptures beſides the Pentateuch, which they ſtill preſerve in the old Hebrew or Phœnician character, as alſo in the vulgar Samaritan.

PENTECOST, a ſolemn feſtival of the Jews, ſo called becauſe it was celebrated on the fiftieth day after the ſixteenth of the month Niſan, which was the ſecond day of the paſſover.

The feaſt of Pentecoſt was inſtituted in memory of the law's being given, on the fiftieth day after the Iſraelites came out Egypt.

It was on the feaſt of Pentecoſt that the Holy Ghoſt miraculouſly deſcended on the apoſtles. See WHITSUNDAY.

PENTHEMIMERIS, in ancient poetry; a part of a verſe conſiſting of two feet and a long ſyllable.

PENULTIMA, or PENULTIMATE SYLLABLE, in grammar, denotes the laſt ſyllable but one of a word; and hence the anti-penultimate ſyllable is the laſt but two or that immediately before the penultima.

PENUMBRA, in aſtronomy, a partial ſhade obſerved between the perfect ſhadow and the full light in an eclipſe.

It ariſes from the magnitude of the ſun's body; for were he only a luminous point, the ſhadow would be all perfect; but by reaſon of the diameter of the ſun, it happens that

that a place which is not illuminated by the whole body of the ſun, does yet receive rays from a part thereof. See the article ECLIPSE.

PEPPER, *Piper*, in natural hiſtory, an aromatic fruit or berry, of a hot dry quality, growing in Sumatra, Java, and Malabar. The pepper-corns adhere i ncluſters to the ſtalks, with pedicles: when ripe, they are firm, not juicy, of a red colour which changes in drying to a black.

We have three kinds of pepper at this time in uſe in the ſhops; namely, the black, the white, and the long pepper.

Common or Black PEPPER, the fruit gathered, probably, before perfect maturity, and dried in the ſun.

White PEPPER, the ripe fruit decorticated by maceration in water. Some of the grains, as brought to us, have pieces of a dark coloured ſkin ſtill upon them.

Of theſe pungent hot ſpices, the black ſort is the hotteſt and ſtrongeſt, and moſt commonly made uſe of for medicinal as well as culinary purpoſes. They both ſeem to heat the conſtitution more than ſome other ſpices that are of equal pungency upon the palate; and from thoſe ſpices they differ in this, that their pungency does not reſide in the volatile parts or eſſential oil, but in a ſubſtance of a more fixed kind, which does not riſe in the heat of boiling water. Pepper, infuſed in water, impregnates the menſtrum pretty ſtrongly withits flavour, but weakly with its taſte; by boiling for ſome time, a little more of its pungent matter is extracted, and its flavour diſſipated.

Long PEPPER, the fruit of an Eaſt Indian plant of the ſame genus with that which produces the black pepper; of a cylindrical figure, about an inch and a half in length, having numerous minute grains diſpoſed round it in a kind of ſpiral direction. This ſpice is hotter and more pungent than either of the preceding kinds, and its ſpirituous extract is proportionably more fiery.

Jamaica-PEPPER. See PIMENTA.

Capſicum, or *Guiney* PEPPER. See the article CAPSICUM.

PERAMBULATION, in law, ſignifies the walking about a foreſt, pariſh or the like, by juſtices or others, in order to mark down and preſerve the limits and bounds thereof.

PERAMBULATIONE FACIENDA, a writ commanding the ſheriff to make preambulation, in order to ſettle the bounds of two adjoining manors.

PERAMBULATOR, in ſurveying, an inſtrument for meaſuring diſtances, called alſo pedometer, way-wiſer and ſurveying wheel.

It conſiſts of a wheel (plate XCVIII. *fig.* 8.) two feet ſeven inches and a half in diameter; conſequently, half a pole, or eight feet three inches in circumference. On one end of the axis is a nut, three quarters of an inch in diameter, and divided into eight teeth; which, upon moving the wheel round, fall into the eight teeth of another nut *c* (*fig.* 9.) fixed on one end of an iron rod Q, and thus turn the rod once round, in the time the wheel makes one revolution. This rod, lying along a groove in the ſide of the carriage of the inſtrument, has at its other end a ſquare hole, into which is fitted the end *b* of a ſmall cylinder P. This cylinder is diſpoſed under the dial-plate of a movement, at the end of the carriage, in ſuch a manner as to be moveable about its axis: its end is cut into aperpetual ſcrew, which falling into the thirty-two teeth of a wheel pependicular thereto, upon driving the inſtrument forward, that wheel makes a revolution each ſixteenth pole. On the axis of this wheel is a pinion with ſix teeth, which, falling into the teeth of another wheel of ſixty teeth, carries it round every hundred and ſixtieth pole, or half a mile.

This laſt wheel, carrying a hand or index round with it over the diviſions of a dial plate, whoſe outer limb is divided into one hundred and ſixty parts, correſponding to the one hundred and ſixty poles, points out the number of poles paſſed over. Again, on the axis of this laſt wheel is a pinion, containing twenty teeth, which, falling into the teeth of a third wheel, which hath forty teeth, drives it once round in three hundred and twenty poles, or a mile. On the axis of this wheel is a pinion of twelve teeth, which, falling into a teeth of the fourth wheel, having ſeventy-two teeth, drives it once round in twelve miles.

This fourth wheel, carrying another index over the inner limb of the dial-plate, divided into twelve for miles, and each mile ſubdivided into halves, quarters, and furlongs, ſerves to regiſter the revolutions of the other hand, and to keep account of the half miles and miles paſſed over as far as twelve miles.

The uſe of this inſtrument is obvious from its conſtruction. Its proper office is in the ſurveying of roads and large diſtances, where a great deal of expedition, and not much accuracy, is required. It is evident, that driving it along, and obſerving the hands, has the ſame effect as dragging the chain, and taking account of the chains and links.

Its advantages are its handineſs and expedition; its contrivance is ſuch, that it may be fitted to the wheel of a coach, in which ſtate it performs its office, and meaſures the road without any trouble at all.

PER ARSIN ET THESIN, in muſic. Per arſin, in a ſong, counterpoint, fugue, &c. is when the notes aſcend from grave to acute; and per theſin, when they deſcend from acute to grave.

PERCEPTION, in logic, the firſt and moſt ſimple act of the mind, whereby it perceives or is conſcious of its ideas. See the article IDEA.

In bare perception, the mind is for the moſt part only paſſive; yet impreſſions made on the ſenſes cauſe no perception, unleſs they are taken notice of by the mind, as we ſee in thoſe who are intently buſied in the contemplation of certain objects. It ought alſo to be obſerved, that the ideas we receive by perception are often altered by the judgment, without our taking notice of it; ſo that we take that for the perception of our ſenſes, which is but an idea formed by the judgment: thus, a man who reads, or hears, without attention, takes little notice of the characters or ſounds, but of the ideas excited in him by them. See JUDGMENT.

The faculty of perception ſeems to be that which conſtitutes the diſtinction between the animal kingdom and the inferior parts of nature. Perception is alſo the firſt ſtep towards knowledge, and the inlet of all the materials of it; ſo that the fewer ſenſes a man has, and the duller the impreſſions that are made by them are, the more remote he is from that knowledge which is to be found in other men. See KNOWLEDGE.

PERCH, or PEARCH, *Pica*, the name of a fiſh diſtinguiſhed by ſeveral tranſverſe ſtreaks, and by having the belly-fins red: it grows in ſome places to a foot and an half in length, and is conſiderably thick in proportion, but its more uſual ſize is eight or nine inches in length: its noſtrils are large and patulous, and nearer the eyes than the extremity of the ſnout.

PERCH, a meaſure of length. See MEASURE.

PERCHANT, among fowlers, denotes a decoy-bird, which being faſtened by the foot, flutters about the place to draw other birds to it.

PERCUSSION, the act of ſtriking. See the article MOTION.

Center of PERCUSSION *of a Body or Figure in Motion* is that point in which all the forces of the ſame are conſidered as united together in one; ſo that if the ſaid figure meets any obſtacle contrary to the motion thereof, it ſtrikes the obſtacle with a greater force than any other point of the figure; and conſequently, if the percutient body revolves round a fixed point, and in its motion ſtrikes any obſtacle with its center of percuſſion, it will, during a ſmall particle of time, preſerve an equilibrium about that point.

Let the inflexible right line PB (pl. XCVIII. *fig.* 10.) with two given weights A, B, appended at the points A and B, revolve about the fixed point P, as a center; and let it be required to determine the center of percuſſion C, of the ſaid weights.

Put $BC = x$; then $CA = BA - x$. The velocity with which B revolves, is as PB; therefore its force may be expreſſed by $PB \times B$; and by the ſame way of reaſoning, the force of A may be expounded by $PA \times A$; therefore, by the above definition of the center of percuſſion, we have $PB \times B \times x = \overline{BA - x} \times PA \times A$; hence $x = \frac{PB \times PA \times A}{\overline{PB \times B + PA \times A}}$; ſubtract this from PB, and we have

PC,

PC, or the distance of the center of percussion from the point of suspension P, equal to $\frac{PA^2 \times A + PB^2 \times B}{PA \times A + PB \times B}$. If there were three, or a greater number of weights, affixed to the rod P B, the distance of their center of percussion from the point of suspension would, in like manner, be found by first multiplying each weight into the square of its distance from the point of suspension, and dividing the sum of those products by that of the products arising from the multiplication of each weight, into its respective distance from the point of suspension. Hence it appears that the center of percussion is the same with the center of oscillation.

PERENNIAL, in botany, is applied to those plants whose roots will abide many years, whether they retain their leaves in winter or not; those which retain their leaves are called ever greens; but such as cast their leaves are called deciduous, or pedisols. Some of these have annual stalks, which die to the root every autumn, and shoot up again in the spring; to which Jungius gives the title of radix restibilis.

PERETERION, a name which chirurgical writers give to the perforating part of the trepan. See the article TREPAN.

PERFECT, something to which nothing is wanting; or that has all the requisites of its nature and kind.

PERFECT, in arithmetic. Perfect number is that, all whose aliquot parts added together, make the same number with the number of which they are such parts.

PERFECT PRETERIT TENSE, in grammar. See PRETERIT.

PERFECT, in music, denotes something that fills and satisfies the mind and the ear: in which sense we say, perfect cadence, perfect concord, &c.

PERFECTION, the state or quality of a thing perfect.

PERFORANS MANUS, in anatomy, a muscle of the fingers, being the flexor of the third phalanx, called also profundus; which, arising at the upper part of the middle of the ulna, and dividing into four tendons, perforates the tendons of the perforatus manus, and is inserted into the beginning of the third phalanx of the four fingers. See PERFORATUS, &c.

PERFORANS PEDIS, in anatomy, a muscle of the toes, being the flexor of the third phalanx: its origin is from the hinder surface of the upper part of the tibia: towards the middle it is divided into four tendons, and these perforate the tendons of the perforatus pedis, and are afterwards terminated in the third phalanx.

PERFORATUS MANUS, in anatomy, a muscle of the fingers, called also sublimis, being the flexor of the second phalanx, arising from the internal condyle of the humerus, and the radius: it is divided into four tendons, which are inserted into the second phalanges of the four fingers. See FLEXOR, &c.

PERFORATUS PEDIS, in anatomy, a muscle of the toes, being the flexor of the second phalanx, arising from the lower and inner surface of the calcaneum. It is divided into four tendons, which are perforated, and is terminated in the bones of the second phalanx.

PERFUME, *Suffitus*, an agreeable artificial odour, affecting the organ of smelling. The generality of perfumes are made up of musk, ambergrise, civet, rose and cedar-woods, orange-flowers, jasmin, jonquils, tuberoses, and other odoriferous flowers: those drugs, commonly called aromatics, such as storax, frankincense, benzoin, cloves, mace, &c. enter the composition of a perfume: some are also composed of aromatic herbs or leaves, as lavender, marjoram, sage, thyme, hyssop, &c.

PERIANTHIUM, in botany, expresses that sort of cup of a flower which either consists of several leaves, or else of one leaf divided into several segments, and surrounds the lower part of the flower.

PERIAGOGE, or PERIBOLE, in rhetoric, is used where many things are accumulated into one period which might have been divided into several.

PERICARDIUM, in anatomy, a membranaceous bag, loosely including the heart, and situated in the middle and lower part of the thorax, between the two lobes of the lungs. See HEART.

The figure of the pericardium is Conic, like that of the heart itself. Its size is such as can conveniently contain the heart without pressing upon it. It is connected with the mediastinum, with a great part of the diaphragm, and with the large vessels of the heart, which, together with this covering, sustain also the heart itself in its place. In beasts of most kinds, the heart is not at all connected with the diaphragm by its pericardium.

The pericardium is composed of a double membrane; the exterior one is common with the pleura and mediastinum; the interior one is proper, lubricous, and is continuous with the coats of the larger vessels. This membrane, when expanded upon the finger, frequently discovers a great number of foraminula, or little apertures. The arteries and veins of the pericardium are from those of the mediastinum and diaphragm, and its nerves are also from the diaphragmatics. Its lymphatics all run to the thoracic duct.

The uses of the pericardium are, 1. To support the heart in a pendulous state, especially when we lie down. 2. To defend the heart from the cold air taken in at the lungs. 3. To preserve it from being injured by water, by matter, or any other extraneous fluid in the cavity of the thorax; and, 4. To contain the liquor of the pericardium, as it is called, which serves to facilitate the motions of the heart.

The liquor of the pericardium is a fluid, resembling in appearance water, in which raw flesh had been washed. The anatomical writers, in general, deduce this fluid from certain glands, situated either in the pericardium, or in the heart itself; but as these glands are not to be found, Heister thinks it more rational to suppose that it is expressed out of the auricles of the heart in its systole. The pericardium is found sometimes in long hectics to co-here with the substance of the heart; and there are accounts of its having been wholly wanting.

PERICARPIUM, among botanists, a covering or case for the seeds of plants. It is the germen of the pistil enlarged.

PERICRANIUM, in anatomy, a thick solid coat, or membrane, covering the outside of the cranium or skull.

Some call it by the name of periosteum, because of its adhering to the bone: others divide it into two membranes, the under one of which immediately investing the skull they call periosteum, and the upper pericranium. In effect, it is one double membrane, consisting, as most others do, of two coats. It is supposed to have its origin from the dura mater, which passing through the sutures of the skull, by means of several filaments, forms this thick membrane; at least it is found connected to the dura mater, by fibres transmitted from it to the membrane through the sutures. About the origin of the temporal muscles, the coats of the pericranium part; the outer passing over those muscles; and the inner still adhering close to the cranium. See PERIOSTEUM.

PERIDROME, *Peridromus*, in ancient architecture, the space, gallery, alley, or the like, in a periptere, between the columns and the wall.

PERIGÆUM, PERIGEE, in astronomy, that point of the sun's or moon's orbit, wherein they are at their least distance from the earth, in which sense it stands opposed to apogee. See APOGEE.

In the ancient astronomy, perigee denotes that point in a planet's orbit, wherein the center of its epicycle is at the least distance from the earth.

PERIGRAPHE, a word usually understood to express a careless or inaccurate delineation of any thing; but in Vesalius it is used to express the white lines or impressions that appear in the musculus rectus of the abdomen.

PERIHELIUM, in astronomy, that point of a planet's or comet's orbit, wherein it is in its least distance from the sun; in which sense it stands in opposition to aphelium.

The ancient astronomers, on account of their supposing the earth in the center of the system, instead of this term used that of perigæum.

PERIMETER, in geometry, the bounds or limits of any figure or body.

The perimeter of surfaces or figures are lines, those of bodies are surfaces. In circular figures, instead of perimeter, we say circumference, or periphery.

PERINÆUM, or PERINEUM, in anatomy, the space between

between the anus and the parts of generation, divided into two equal lateral diviſions, by a very diſtinct line, which is longer in males than females. The perinæum is ſubject to laceration in a difficult birth. In this part an operation is performed, called a puncture of the perinæum, or perforation made into the urethra and bladder, to diſcharge the urine when it is ſuppreſſed. See the articles DELIVERY, ISCHURY, PARACENTESIS, and PUNCTURE.

PERIOD, in aſtronomy, the time taken up by a ſtar or planet in making a revolution round the ſun; or the duration of its courſe till it returns to the ſame point of its orbit.

The periodical times of the planets round the ſun are as follow:

The period of	days.	hours.	min.	ſeconds
Mercury — — —	87	23	15	53
Venus — — — —	224	16	49	24
The earth — — —	365	6	9	14
Mars — — — —	686	23	27	30
Jupiter — — — —	4332	12	20	25
Saturn — — — —	10759	6	36	26

See MERCURY, VENUS, &c.

There is a wonderful harmony between the diſtances of the planets from the ſun, and their periods round him; the great law whereof is, that the ſquares of the periodical times of the primary planets, are to each other as the cubes of their diſtances from the ſun; and likewiſe, the ſquares of the periodical times of the ſecondaries of any planet, are to each other as their cubes of their diſtances from that primary. This harmony among the planets is one of the greateſt confirmations of the Copernican hypotheſis. See COPERNICAN.

PERIOD, in chronology, denotes a revolution of a certain number of years, or a ſeries of years, whereby, in different nations, and on different occaſions, time is meaſured; ſuch are the following.

Calippic PERIOD, a ſyſtem of ſeventy-ſix years.

The Calippic period comprehends 48 common year, and 28 intercalary ones, 940 lunations, and 22759 day. See the article CYCLE.

Conſtantinopolitan PERIOD. See the article JULIAN *Period.*

Dionyſian PERIOD, or *Victorian* PERIOD, a ſyſtem of 532 lunæ ſolar and Julian years, which being elapſed, the characters of the moon fall again upon the ſame day and feria, and revolve in the ſame order, according to the opinion of the ancients.

This period is otherwiſe called the great paſchal cycle, becauſe the Chriſtian church firſt uſed it, to find the true time of the paſcha, or Eaſter. The ſum of theſe years ariſe by multiplying together the cycles of the ſun and moon. See the article EASTER.

Hipparchus's PERIOD, a ſyſtem of 304 years, both lunar and ſolar, which, being elapſed, Hipparchus thought that the reckoning by the lunar motion would coincide again with the ſolar meaſures. This period comprehends 3760 lunar months, or 111039 days; the ſum of which ariſes from the multiplication of the Calippic period by 4, ſubtracting unity from the product.

Julian PERIOD. See JULIAN.

Metonic PERIOD, that invented by Meton, being the ſame with the cycle of the moon.

PERIOD, in grammar, denotes a ſmall compaſs of diſcourſe, containing a perfect ſentence, and diſtinguiſhed at the end by a point, or full ſtop, thus (.); and its members or diviſions marked by commas, colons, &c. See the articles POINT and SENTENCE.

The celebrated definition of Ariſtotle is, that a period is a diſcourſe which has a beginning, a middle, and an end, all viſible at one view. And De Colonia defines a period a ſhort but perfect ſentence, conſiſting of certain parts or members, depending one upon another, and connected together by ſome common vinculum.

PERIOD is alſo uſed for the character (.) wherewith the periods of a diſcourſe are terminated, or expreſſed, being commonly called a full ſtop or point. See PUNCTUATION.

PERIOD, in numbers, a diſtinction made by a point, or comma, after every ſixth place or figure; and is uſed in numeration for the readier diſtinguiſhing, and naming the ſeveral figures or places.

PERIOD *of a Diſeaſe*, in medicine, is the time betwixt the acceſs of one fit, or paroxyſm, and that of the next, including the entire exacerbation, decline, and intermiſſion, or remiſſion.

PERIODIC, or PERIODICAL, ſomething that terminates and comprehends a period; ſuch is a periodic month, being the ſpace of time wherein the moon diſpatches her period.

PERIOECI, περιοικοι, in geography, ſuch inhabitants of the earth as have the ſame latitudes, but oppoſite longitudes; or live under the ſame parallel, and the ſame meridian, but in different ſemi-circles of that meridian, or in oppoſite points of the parallel. Theſe have the ſame common ſeaſons throughout the year, and the ſame phænomena of the heavenly bodies; but when it is noonday with the one, it is midnight with the other, there being twelve hours between them in an eaſt or weſt direction. Theſe are found on the globe, by the hour index, or by turning the globe half round, that is 180 degrees either way.

PERIOSTEUM, or PERIOSTIUM, in anatomy, a nervous vaſculous membrane, endued with a very quick ſenſe, immediately ſurrounding, in every part, both the internal and external ſurfaces of all the bones in the body, excepting only ſo much of the teeth as ſtand above the gums, and the peculiar places on the bones, in which the muſcles are inſerted. It is hence divided into the external and internal perioſteum, and where it externally ſurrounds the bones of the ſkull, it is generally called the pericranium.

This membrane ſerves to conſtitute the firſt rudiments of the bones in a fœtus in utero. It is the organ of ſecretion for the bony matter, as the membrana adipoſa is for the fat: all the bones, during the time of their growth, receiving from it their matter of accretion, and afterwards their nutriment. The blood veſſels of the perioſteum penetrate in innumerable places into the bones themſelves, as is evidently ſeen in the freſh bones of children. The ſenſibility in the bones is wholly owing to this membrane; for when diveſted of this, they may be ſawed, cut, or burnt without pain. It gives the determination and figure to bones, as is evident from this, that when it is wounded, exoſtoſes, tophi, and caries ariſe in the part. The perioſteum is of different thickneſs in different parts, but in general the internal is vaſtly thinner than the external, and ſerves to nouriſh that part of the bones. It receives alſo nerves and blood-veſſels from the outſide, through certain canals in the ſubſtance of the bones, which it communicates to the marrow in ſuch as have any. It is generally ſaid to ariſe from the dura mater of the brain; but Heiſter thinks this opinion ſcarce right, as the perioſteum is evidently formed at the ſame time with the dura mater in the fœtus.

PERIPATETIC PHILOSOPHY, that ſyſtem taught and eſtabliſhed by Ariſtotle, and maintained by his followers, the Peripatetics, called alſo Ariſtotelians.

The greateſt and beſt part of Ariſtotle's philoſophy, he is ſaid to have borrowed from his maſter Plato. Serranus affirms confidently, and ſays that he is able to demonſtrate it, that there is nothing exquiſite in any part of Ariſtotle's philoſophy, dialectics, ethics, politics, phyſics, or metaphyſics, but is found in Plato; and of this opinion are many of the ancient authors, Clemens Alexandrinus, &c. Ariſtotle's philoſophy preſerved itſelf *in puris naturalibus*, a long time, none of his followers or commentators having dared to make any innovation therein, till the beginning of the thirteenth century, when it began to be new modelled. A reformed ſyſtem of peripateticiſm was firſt introduced into the ſchools in the univerſity of Paris, from whence it ſoon ſpread throughout Europe, and has ſubſiſted in the univerſities to this day, under the name of ſchool philoſophy; the foundation whereof is Ariſtotle's doctrine frequently miſunderſtood, and oftener miſapplied: but of theſe, at different times, have ſprung ſeveral branches, as the Thomiſts, Scotiſts, Nominaliſts, &c. See THOMIST, &c.

PERIPETIA, περιπετεια, in the drama, that part of a tragedy, wherein the action is turned, the plot unravelled, and the whole concludes. See CATASTROPHE.

PERIPHERY, in geometry, the circumference of a circle, ellipſis, or any other regular curvilinear figure. See the article CIRCUMFERENCE, CIRCLE, &c.

PERIPHRASIS, in rhetoric, the ſame with circumlocution. See the article CIRCUMLOCUTION.

PERIPNEUMONY, in medicine, an inflammation of the lungs, attended with a weight on the lungs, a difficulty of breathing, and an oppreſſion of the breaſt, with a purulent ſpitting, and a fever accompanied with a cough. When the inflammation affects both the lobes, and the whole body of the lungs, the caſe is deſperate.

The peripneumony is diſtinguiſhed into two kinds; one of which has its ſeat at the extremity of the pulmonary artery, and is called the true peripneumony; and the other is ſituated in the bronchial arteries, and is called the ſpurious or baſtard peripneumony.

The true peripneumony is often cured by a critical reſolution and concoction of the morbific matter, which is either attenuated, ſo as to be returned into the channels in the common courſe of circulation; or expectorated by coughing; which may be eaſily known by an abatement of the ſymptoms, and the patient's falling into gentle breathing ſweats.

Copious bleeding is the moſt effectual remedy in the beginning of this diſeaſe; but not ſo proper when expectoration goes on ſucceſsfully, becauſe it ſometimes ſuppreſſes it, and in that caſe ſudorifics thicken the matter which is expectorated. The motions of nature ought to be followed: the aliment ought to be more ſlender and thin than in any other inflammatory diſeaſe whatſoever; common whey is ſufficient to preſerve the ſtrength of the patient; relaxing aliments are proper, of which barley, and all its preparations, are the beſt. Diuretics that have not much acrimony are uſeful: and for this intention, an infuſion of fennel-roots in warm water, with milk, is good. If nature relieves by a diarrhœa, without ſinking the ſtrength of the patient, it ought to be promoted by emollient clyſters. But if the patient is neither relieved nor dies in eight days, the inflammation will end in a ſuppuration, and an abſceſs of the lungs, and ſometimes in ſome other part of the body: in this caſe bleeding muſt be forborne; the diet muſt be mild, ſoft, incraſſating, and more plentiful; and tepid vapours ſhould be taken into the lungs, from decoctions of proper ingredients. When, by the ſymptoms and time, the impoſthume may be judged to be ripe, the vapour of vinegar, and any thing that creates a cough, are proper; for the ſooner it is broke, the leſs danger will the lungs be in. In the ſtate which is not abſolutely deſperate, the aliment ought to be milk, and the drink milk and barley-water, with gentle anodynes, that the patient may have ſome reſt.

Spurious, or *Baſtard*-PERIPNEUMONY, a diſeaſe of the lungs, which generally ariſes from a heavy pituitous matter generated in the blood, and caſt upon the lungs. In this diſorder the patient is hot and cold by turns, is giddy upon the leaſt motion, and complains of a rending pain of the head whenever he coughs; he vomits up every thing that he drinks; the urine is turbid and red, and the whole thorax full of pain. In this diſorder the patient ſhould be let blood from a large orifice; and then give him the following clyſter, which muſt be repeated daily, till the ſymptoms evince that the lungs are relieved: Take of honey, three ounces; of nitre, one dram; one yolk of an egg; and eight ounces of barley-water; make them into a clyſter. Let the patient's diet be very ſlender, ſuch as weak broths, ſharpened a little with orange or lemon-juice; and he may drink a weak mixture of honey and water; the ſteams of warm water may be taken in at the mouth, and the following decoction given him: Take of the roots of fennel, two ounces; of the roots of graſs, four ounces; of the leaves of pellitory, and agrimony, each an handful and a half; of the bruiſed ſeeds of white poppy, one ounce; and of liquorice, one ounce and an half; boil them, for a quarter of an hour, in two pints and a half of water; of which let the patient drink two ounces every two hours. Likewiſe let his legs and feet be bathed, and large bliſters applied.

PERIPTERE, in the ancient architecture, a building encompaſſed on the outſide with a ſeries of inſulated columns, forming a kind of portico all around; ſuch were the portico of Pompey, the ſeptizon of Severus, and the baſilica of Antoninus.

The peripteres were properly temples, which had columns on all the four ſides, by which they were diſtinguiſhed from the proſtyle and amphiproſtyle, the laſt of which had no columns before, and the firſt none on the ſides.

M. Perault obſerves, that periptere, in the general ſenſe of the word, is the name of a genus, including all the ſpecies of temples, which have porticos of columns all around, whether the columns be diptere, or pſeudodiptere, or ſimply periptere, which is a ſpecies that bears the name of a genus, and which has its columns diſtant from the wall, the breadth of an intercolumniation.

PERISCII, in geography, the inhabitants of either frigid zone, between the polar circles and the poles; where the ſun, when in the ſummer-ſigns, moves only round about them, without ſetting, and conſequently their ſhadows, in the ſame day, turn to all the points of the horizon.

PERISTALTIC, in medicine, a vermicular ſpontaneous motion of the inteſtines, performed by the contraction of the circular and longitudinal fibres, of which the fleſhy coats of the inteſtines is compoſed; by means whereof the chyle is driven into the orifices of the lacteal veins, and the fæces are protruded towards the anus. See CHYLIFICATION.

When this motion comes to be depraved, and its direction changed, ſo as to proceed from below upwards, it produces what is called the iliac paſſion. See the article ILIAC PASSION.

PERISTAPHYLINUS, in anatomy, a name which ſome give to a muſcle of the uvula, more properly denominated pterygoſtaphylinus. See the article UVULA and PTERYGOSTAPHYLINUS.

PERISTYLE, in ancient architecture, a building encompaſſed with a row of columns on the inſide: ſuch was the hypæthre temple of Vitruvius, and ſuch are now ſome baſilicas in Rome, ſeveral palaces in Italy, and moſt cloiſters of religious.

Periſtyle is alſo uſed by modern writers, for a range of columns, either within or without a building: thus we ſay, the Corinthian periſtyle of the portal of the Louvre, &c.

PERISYSTOLE, in medicine, the interval of reſt between the two motions of the heart, viz. that of the ſyſtole, or contraction, and that of the diaſtole, or dilatation.

PERITONÆUM, in anatomy, is a thin, ſmooth, and lubricous membrane, inveſting the whole internal ſurface of the abdomen, and containing moſt of the viſcera of that part, as it were in a bag. It lies immediately under the tranſverſe muſcles of the abdomen, and adheres to them, and alſo coheres with the diaphragm, and with all the viſcera lodged in this part. It entirely incloſes the ſtomach, the inteſtines, the meſentery, the omentum, the liver, the ſpleen, and the pancreas: as to the kidneys, ureters, and ſmaller veſſels of the abdomen, it covers them only on the anterior part, and the urinary bladder only on the poſterior. The peritonæum is compoſed of a double membrane, or lamella; the exterior one has longitudinal and ſlender fibres, and the interior tranſverſe and more robuſt ones. There are alſo ligaments formed from it, viz. that which ſuſpends the liver, and the two ligamenta lata of the uterus in women. Its proceſſes, ſent out of the abdomen, are two, and theſe ſerve to ſurround and incloſe the ſpermatic veſſels and the teſticles.

The arteries and veins of the peritonæum are ſupplied from the epigaſtric, mammary, lumbar, and diaphragmatic veſſels; and the nerves are propagated from thoſe of the diaphragm, back, loins, and os ſacrum.

The uſes of the peritonæum are, 1. To incloſe the contents of the abdomen; for when this part is dilated, rounded, or broken, they fall out of their due places, and ruptures are formed. 2. To give an external covering to almoſt all the parts contained in the abdomen, which are therefore generally ſaid to have their external membrane from the peritonæum. And, 3. To form the proceſs of the peritonæum, and the tunica vaginalis of the teſtes.

PERITROCHIUM, in mechanics, denotes a wheel, or circle, concentric with the baſe of a cylinder, and moveable together with it, about an axis. See AXIS IN PERITROCHIO.

PERJURY, in law, the crime of ſwearing falſely, where a lawful oath is adminiſtered by one in authority, in a matter relating to the iſſue or cauſe in queſtion, whether it be a perſon's own wilful act, or done by the ſubornation of others.

In order to make an offence perjury, it muſt appear to be wilful and deliberate, and not done through ſurpriſe or inadvertency: it muſt be direct and poſitive, and not where a perſon ſwears as he thinks or believes: but in caſe a perſon ſwears to what he is ignorant of, it is a falſe oath, even though what he ſwears ſhould happen to be true; thus, a plaintiff cauſed two perſons to ſwear to the value of goods, which they never ſaw, when, notwithſtanding they ſwore what was true, it was adjudged to be perjury in them. At the common law, perjury, and the ſubornation of it, are puniſhable by fine, impriſonment, pillory, tranſportation, &c.

PERMANENT, in general, ſomething that continues the ſame, whether in nature or ſituation, and other circumſtances: thus air, generated by fermentation, is ſaid to be permanent, becauſe it continues to ſhew all the natural properties of common air.

Thus alſo thoſe cups of flowers are called permanent, which remain after the flower-leaves are fallen.

PERMEABLE, a term applied to bodies of ſo looſe and porous a ſtructure, as to let ſomething paſs through them.

PERMUTATION, in commerce, the ſame with bartering. See BARTERING.

In the canon law, permutation denotes the actual exchange of one benefice for another.

PERMUTATION *of Quantities*, in algebra, the ſame with combination.

PERNANCY, in law, ſignifying taking or receiving, is peculiarly applied to tithes taken in kind.

PERNIO, in ſurgery, a chilblain or kibe, generally produced in the hands and feet by violent cold. See the article COLD.

Chilblains are accompanied with inflammation, heat, redneſs, pricking pain, and immobility of that limb; ſometimes they are of a livid or leaden colour, and ſometimes they break out with ſcabs, or elſe with chops, or ſlits, which afterwards penetrate deeper, and become ulcerous. The humour which they diſcharge is a little fœtid, and pretty much reſembles pus or ſanies; and they terminate in either diſperſion, ſuppuration, or gangrene and ſphacelus.

While the chilblains are yet tumified and red, and the part retains its ſenſe and motion, without any great heat and pain, the diſorder is then of the mildeſt kind; on the contrary, when they are livid, occaſion the limb to become ſtiff and inſenſible, or excite pricking pains therein, there is then danger of a worſe conſequence, leſt it ſhould degenerate into a gangrene, or at leaſt a deep exulceration. There being no room to doubt but that cold is the cauſe of chilblains, it readily follows, that the cure muſt conſiſt chiefly in reſtoring the blood to its former fluidity and free circulation as ſoon as poſſible; for which purpoſe an external as well as internal treatment is neceſſary. In the external treatment, the patient being expoſed in a temperate air, ſhould, according to Heiſter, exerciſe his limbs as much as poſſible, in order to advance him ſtill to a greater warmth or heat; but when he is too weak to exerciſe himſelf, it will be proper to bathe the parts affected with ſnow, or cold water; after which, when the limb becomes ſenſible, comfortable medicines may be applied, ſuch as ſpirit of wine, either pure, or with theriaca, rock-oil, balſam of ſulphur, &c. When the parts affected have been well rubbed or bathed with theſe, the patient may then be advanced towards the fire, or be put to bed, endeavouring afterwards to excite a gentle ſweat.

In the internal treatment, great ſervice will be had from a few glaſſes of hot wine, wherein has been boiled ſome cinnamon and ſugar; though it may not be improper to give with this alternately, a ſmall quantity of ſome ſudorific mixture. If the wine be not at hand, good ale boiled with cinnamon, cloves, and ſugar, may well enough ſupply its place. It ſhould be continued ſo as to keep up a ſweat for a whole hour, for half an hour, or according to the ſeveral circumſtances: but if the diſorder is much ſlighter, this method is then not ſo directly neceſſary; it may then be laid aſide; though, in the opinion of Heiſter, it is much preferable to any other method. When chilblains tend to a ſuppuration, then it is proper to treat them like other abſceſſes.

If a patient has before been troubled with chilblains, which are uſed to return every year in the winter, the preſervative againſt the diſorder is to anoint the parts affected with petroleum, or oil of turpentine, before and after the ſeverity of the winter comes on; but when the diſorder has begun to ſhew itſelf again by tumour, inflammation, and pain, the heel or finger may be wrapped up in a ſwine's bladder, dipped in the forementioned oil, and the cold itſelf ſhould always be carefully avoided by proper cloths or coverings.

PERONE, in anatomy, the ſame with fibula. See FIBULA.

PERONÆUS, in anatomy, an epithet applied to ſome of the muſcles of the perone or fibula. 1. The peronæus anticus, is a muſcle that ariſes at the anterior part of the middle of the fibula, and terminates at the exterior metatarſal bone; the office of this muſcle is to draw the foot upwards. 2. Peronæus poſticus is a muſcle that ariſes at the upper part of the fibula, but its tendon is turned back under the tarſus, and is inſerted into that bone of the metatarſus, which ſupports the great toe. There is uſually in old ſubjects a ſeſamoide bone in the tendon of this muſcle, where it paſſes under the os cuboides. Its office is alſo to pull the foot upwards.

PERFORATION, *Perforatio*, in rhetoric, the epilogue, or laſt part of an oration, wherein what the orator had inſiſted on through his whole diſcourſe is urged afreſh with greater vehemence and paſſion.

PERPENDICULAR, in geometry, a line falling directly on another line, ſo as to make equal angles on each ſide, called alſo a normal line. Thus the line I G (plate XCIX. *fig.* 1.) is perpendicular to the line K H, and makes right and equal angles therewith.

To erect a PERPENDICULAR *on a given Line*, as A B, from any aſſigned point as B (*fig.* 2.) Upon any point, taken at an adventure, out of the given line, as at C, deſcribe ſuch a circle as will paſs through the point from whence the perpendicular muſt be raiſed, as at B, viz. make C B radius; and from the point where the circle cuts the given line as at A, draw the circle's diameter A C D. Then from the point D draw the right line D B, and it will be the perpendicular, as was required.

To let fall a PERPENDICULAR *on a given Line*, as A B, (*fig.* 3) from any aſſigned points, as C. Upon the given point C deſcribe ſuch an arch of a circle as will croſs the given line A B in two points, as at *d* and *f*; then biſſect the diſtance between thoſe two points *d* and *f*, as at *x*. Draw the right line C *x*, and it will be the perpendicular required.

PERPENDICULAR *to a Parabola* is a right line cutting the parabola in the point in which any other right line touches it, and is alſo itſelf perpendicular to that tangent.

PERPENDICULARITY *of Plants*, in natural hiſtory, a quality obſerved in all plants, which though they riſe a little crooked, yet the ſtems ſhoot up, and the roots ſink down as much as poſſible in a perpendicular direction. This curious phænomenon was firſt obſerved by M. Dodart, who publiſhed an expreſs eſſay on the affectation of perpendicularity obſerved in the ſtems or ſtalks of all plants, in the roots of many, and even in their branches. He obſerves, that ſuch plants, or parts of plants, as by the declivity of the ſoil come out inclined, or ſuch as are diverted out of the perpendicular by any violent means, again redreſs and ſtraighten themſelves, and recover their perpendicularity by making a ſecond or contrary bend or elbow without rectifying the firſt.

PERPETUAL, ſomething that endures always, or laſts for ever.

PERPETUAL GLANDS, in anatomy, are thoſe which are natural, thus diſtinguiſhed from the adventitious ones.

PER-

PERPETUAL MOTION, in mechanics, a motion which is ſupplied from itſelf, without the intervention of any external cauſe.

This famous problem has given riſe to an infinite number of ſchemes, which have all proved equally abortive. What has given riſe to the belief of a perpetual motion is the following mechanical principle.

The momentums of the weight and power are as the quantities of matter in each multiplied by their reſpective celerities, and the celerities are as the diſtances from the center of motion, and alſo as the ſpaces paſſed through in a perpendicular direction in the ſame time; it muſt follow that there will be an equilibrium between the weights, when they are to each other reciprocally as the diſtances from the center, or as the celerities of the motions, or as the perpendicular aſcent or deſcent in the ſame time; and this univerſally in all mechanical powers whatever, which is therefore the fundamental principle of all mechanics. — The nature of this propoſition, not being underſtood by ſmatterers in mechanics, gave them occaſion to imagine the poſſibility of a perpetual motion from one part of it, which they did not ſee was utterly impoſſible from another part of it.

What ſeems to promiſe the poſſibility of ſuch a movement, is this, viz. that the momenta of equal bodies are as their diſtances from the center of motion. Hence ſay the perpetual motion men, if a wheel were conſtructed of the form of that in the figure A B C D (plate XCIX. *fig.* 4.) with circular cells going from the inner part E F G H to the outer, containing equal balls, C, D, E, F; then upon turning the wheel they muſt move towards the center N on one part, as the ball E; and from it on the oppoſite part, as the ball C; and by this means the ball C will have a greater momentum than the ball F, and ſo will determine the wheel to move round; and ſince this muſt be the caſe of all the balls E and C that come into the ſituation E C, the wheel muſt neceſſarily move continually, becauſe it will bring two balls into that ſituation. It is true, were there but two balls E and C, the ball C would by this contrivance move the wheel $\frac{1}{4}$ round, viz. while it deſcended from C to D; and by this means would raiſe the ball E to F, and there they will abide in the ſituation D F; but, ſay the men of this perſuaſion, two other balls, ſucceeded to the places E and C, will ſtill keep the wheel moving. Yes, ſo they would, if the balls at D and E could be taken away the moment they come into that poſition, not elſe; for the balls C and E, in order to move the wheel, muſt move the balls D and F, which have equal momenta, as being at the ſame diſtance each from the center, as are the other two reſpectively, which is abſurd by the general propoſition.

The abſurdity of a perpetual motion will ſtill farther appear, if we conſider that the momenta of bodies are always proportioned to the perpendicular deſcent or aſcent to or from the center of the earth. Since, therefore, in the wheel the bodies are all equal by ſuppoſition, and the perpendicular ſpaces through which they deſcend and aſcend, above and below the horizontal line or diameter A C, are equal; it follows, that an equilibrium muſt neceſſarily enſue. Thus, ſo far is this wheel from producing a perpetual motion, that it admits of none at all.

PERPETUITY, in law, is when an eſtate is intended to be ſo ſettled in law, &c. that it may not poſſibly be undone, or made void.

PERQUISITE, in law, is any thing gotten by a man's own induſtry, or purchaſed with his money; in contradiſtinction to what deſcends to him from his father or other anceſtor.

PERQUISITES *of Courts*, are the profits which caſually accrue to a lord of the manor from his courts-baron, by fines for copyholds, eſcheats, heriots, amercements, &c.

PERRON, in architecture, the ſteps in the front of a building, raiſed before the doors of great houſes, and leading to the firſt ſtory, when raiſed above the level of the ground.

Perrons are made of different forms and ſizes, according to the ſpace and height they are to lead to: ſometimes the ſteps are round, or oval, but more uſually they are ſquare. Where a perron is thirteen or fifteen ſteps high, their range ought to be interrupted by one or two landing places, that there may not be too many ſteps to mount ſucceſſively, and that the eye may not be diſpleaſed by viewing ſo great a height without reſts. A perron ſhould always be confined to the height of the zocle, or foot of the whole building.

PERRY, a drink made of pears, in the ſame manner as cyder is made from apples. See CYDER.

The pears muſt be perfectly ripe, and to give the liquor a greater degree of tartneſs, ſome mix crabs with them. The beſt fruit for making perry, are ſuch as are leaſt fit for eating, as the choak-pear, boreland-pear, horſe-pear, and the barberry-pear.

PER SE, in the ſchools, is ſometimes oppoſed to per accidens; in which ſenſe, a thing is ſaid to agree with another per ſe, when the agreement is not owing to any accidental event, but is found in the intrinſic principles of things themſelves.

Among chemiſts, when a body is diſtilled ſingly, and without the uſual addition of any other matter to raiſe it, it is ſaid to be diſtilled per ſe.

PERSECUTION is any pain or affliction which a perſon deſignedly inflicts upon another; and, in a more reſtrained ſenſe, the ſufferings of Chriſtians on account of their religion.

Hiſtorians uſually reckon ten general perſecutions, the firſt of which was under the emperor Nero, thirty one years after our Lord's aſcenſion; when that emperor having ſet fire to the city of Rome, threw the odium of that execrable action on the Chriſtians, who under that pretence were wrapped up in the ſkins of wild beaſts, and worried and devoured by dogs; others were crucified, and others burnt alive. The ſecond was under Domitian, in the year 95. In this perſecution St. John the apoſtle was ſent to the iſle of Patmos, in order to be employed in digging in the mines. The third began in the third year of Trajan, in the year 100, and was carried on with great violence for ſeveral years. The fourth was under Antoninus the philoſopher, when the Chriſtians were baniſhed from their houſes, forbidden to ſhew their heads, reproached, beaten, hurried from place to place, plundered, impriſoned, and ſtoned. The fifth began in the year 197, under the emperor Severus. The ſixth began with the reign of the emperor Maximinus in 235. The ſeventh, which was the moſt dreadful perſecution that had ever been known in the church, began in the year 250, in the reign of the emperor Decius, when the Chriſtians were in all places driven from their habitations, ſtripped of their eſtates, tormented with racks, &c. The eighth began in the year 257, in the fourth year of the reign of the emperor Valerian. The ninth was under the emperor Aurelian, A. D. 274, but this was very inconſiderable: and the tenth began in the nineteenth year of Diocleſian, A. D. 303. In this dreadful perſecution, which laſted ten years, houſes filled with Chriſtians were ſet on fire, and whole droves were tied together with ropes, and thrown into the ſea.

PERSEVERANCE, in theology, a Chriſtian virtue, by which we are enabled to perſiſt in the way of ſalvation to the end.

PERSEUS, in aſtronomy, a conſtellation of the northern hemiſphere, which, according to the catalogues of Ptolemy and Tycho, contains twenty-nine ſtars; but in the Britannic catalogue, ſixty-ſeven.

PERSIA, a large kingdom of Aſia, 1200 miles long, and almoſt as much broad; ſituated between 45° and 67° of eaſt longitude, and between 25° and 45° of north latitude; bounded by Circaſſian Tartary, the Caſpian Sea, and the river Oxus on the north; by India, on the eaſt; by the Indian ocean, and the gulphs of Ormus and Perſia, on the ſouth; and by the Turkiſh empire on the weſt.

PERSIAN-WHEEL, an engine, or wheel, turned by a rivulet, or other ſtream of water, and fitted with open boxes at its cogs, to raiſe water for the overflowing of lands, or other purpoſes.

It may be made of any ſize, according to the height the water is to be raiſed to, and the ſtrength of the ſtream by which it is turned. This wheel is placed ſo, that its bottom only is immerſed in the ſtream, wherein the open boxes at its cogs are all filled one after another

other with water, which is raiſed with them to the upper part of the wheel's circuit, and then naturally empties itſelf into a trough which carries it to the land.

PERSICA, the peach. See PEACH.

PERSICARIA, in botany, a genus of arſmart plants, with a monopetalous flower, divided into five oval ſegments, alternately patent and connivent: there is no pericarpium; the ſeed, which is ſingle, and of an oval compreſſed figure, being contained in the flower-petal, which is permanent.

There is great irregularity in this genus, there being in ſome ſpecies only five ſtamina; and in others ſix, or eight.

The mild or ſpotted arſmart is ſaid to be a good vulnerary and antepileptic: and the biting arſmart is a good ſtimulating medicine, and diuretic: its freſh leaves are alſo uſed by farriers for cleanſing old ulcers.

PERSON, an individual ſubſtance of a rational or intelligent nature. Thus we ſay, an ambaſſador repreſents the perſon of his prince; and that in law, the father and ſon are reputed the ſame perſon.

In theology, the godhead is divided into three perſons; but here the word perſon is deſigned to convey a peculiar idea, very different from that attached to it every where elſe; it being only uſed for want of another term more pertinent and expreſſive.

PERSON, in dramatic poetry, the character aſſumed by an actor, or he who is repreſented by the player.

PERSON, in grammar, a term applied to ſuch nouns or pronouns, as being either prefixed or underſtood, are the nominatives in all inflexions of a verb; or it is the agent or patient in all finite and perſonal verbs.

PERSONABLE, in law, ſignifies the being able to maintain a plea in court; eſpecially in the caſe of an alien, who may be made perſonable by act of parliament.

It is alſo uſed to ſignify a capacity to receive any thing granted or given.

PERSONAL, any thing that concerns, or is reſtrained to, the perſon: thus it is a maxim in ethics, that all faults are perſonal.

PERSONAL ACTION, in law, is an action levied directly and ſolely againſt the perſon; in oppoſition to a real or mixed action.

PERSONAL GOODS, or CHATTELS, in law, ſignifies any moveable thing belonging to a perſon, whether alive or dead.

PERSONAL TYTHES are tythes payable out of the profits obtained by a man's perſonal labour and induſtry, as in buying, ſelling, handicraft, &c.

PERSONAL VERB, in grammar, a verb conjugated in all the three perſons: thus called, in oppoſition to an imperſonal verb, or that which has the third perſon only. See IMPERSONAL VERB.

PERSONALITY, in the ſchools, that which conſtitutes an individual a diſtinct perſon.

PERSONATED FLOWERS, among botaniſts, are flowers which reſemble the gaping mouths of certain living creatures. See FLOWER.

PERSONIFYING, or PERSONALIZING, the giving an inanimate being the figure, ſentiments, and language of a perſon.

PERSPECTIVE, the art of delineating viſible objects on a plain ſurface, ſuch as they appear at a given diſtance upon a tranſparent plane, placed perpendicular to the horizon, between the eye and the object.

The word is derived from the Latin, *perſpicio*, to ſee plainly.

Perſpective conſiſts of two parts, ſpeculative and practical.

The ſpeculative part, or theory, makes a conſiderable branch of direct optics, in regarding the appearances of all viſible objects, as they exhibit themſelves to the naked eye, and reducing thoſe appearances to mathematical rules and theorems.

The practical part is an application of theſe rules to the actual deſcription of thoſe appearances, the doing of which in a moſt eaſy and uniform manner, for all different caſes, is all that can be expected from it.

But as this part is purely mathematical, its aſſiſtance towards drawing is only what can be performed by rule and compaſs, and can therefore ſtrictly ſerve only for finding the images of points, of which they are compoſed; and as theſe are infinite, it is endleſs to find them all by the ſtrict rules; whence it becomes neceſſary, after a ſufficient number of them are found, to complete the image by the help of drawing, to the better effecting of which theſe points ſerve as a guide. Thus, when a circle is to be deſcribed, the practical rules ſerve to find a ſufficient number of points in the circumference; which, being neatly joined by hand, will perfect the image, ſo that, in ſtrictneſs, nothing in this image is found by mathematical rules, ſave the few particular points; the reſt owes its being to the hand of the drawer.

Thus alſo, if any complicated figure be propoſed, it may not be eaſy to apply the practical rules to the deſcription of every minute part, but by incloſing that figure in a regular one, properly ſubdivided and reduced into perſpective, that will ſerve as a help, whereby a perſon, ſkilled in drawing, may with eaſe deſcribe the object propoſed: upon the whole, where the boundaries of the propoſed objects conſiſt of ſtraight lines, and plain ſurfaces, they may be deſcribed directly by the rules of perſpective; but when they are curvilinear, either in their ſides or ſurfaces, the practical rules can only ſerve for the deſcription of ſuch right-lined caſes as may conveniently incloſe the objects, and which will enable the deſigner to draw them within thoſe known bounds, with a ſufficient degree of exactneſs.

It is therefore in vain to ſeek, by the practical rules of perſpective, to deſcribe all the little hollows and prominencies of objects, the different light and ſhade of their parts, or their ſmaller windings and turnings; the infinite variety of the folds in drapery; of the boughs and leaves of trees, or the features and limbs of men and animals; much leſs to give them that roundneſs and ſoftneſs, that force and ſpirit, that eaſineſs and freedom of poſture, that expreſſion and grace which are requiſite to a good picture: perſpective muſt content itſelf with its peculiar province of exhibiting a kind of rough draught to ſerve as a groundwork, and to aſcertain the general proportions and places of the objects, according to their ſuppoſed ſituations, leaving the reſt to be finiſhed, beautified, and ornamented by a hand ſkilful in drawing.

It is true, perſpective is of moſt uſe where it is moſt wanted, and where a deviation from its rules would be the moſt obſervable; as in deſcribing all regular figures, pieces of architecture, and other objects of that ſort, where the particular tendency of the ſeveral lines is moſt remarkable; the rule and compaſs, in ſuch caſes, being much more exact than any deſcription made by hand: but ſtill the figure, deſcribed by the perſpective rules, will need many helps from drawing; the capitals, and other ornaments of pillars, and their entablatures, the ſtrength of light and ſhade, the apparent roundneſs and protuberance of the ſeveral parts, muſt owe their beauty and finiſhing to the deſigner's hand; but, with regard to ſuch objects as have no conſtant and certain determinate ſhape or ſize, ſuch as clouds, hills, trees, rivers, uneven grounds, and the like, there is a much larger latitude allowable, provided the general bulk, or uſual natural ſhape of thoſe objects, be in ſome meaſure obſerved, ſo as not to make them appear unnatural or monſtrous. See the article DRAWING.

But, although the ſtrict practical rules of perſpective are in a great meaſure confined to the deſcription of right-lined figures, yet the knowledge of the general laws of that ſcience is of great and neceſſary uſe to inform the judgment, after what manner the images of any propoſed lines ſhould run, which way they ſhould tend, and where terminate; and thereby enables it the better to determine what appearance any objects ought to put on, according to their different ſituations and diſtances: it accuſtoms the eye to judge, with greater certainty, of the relations between real objects and their perſpective deſcriptions, and the hand to draw the ſame accordingly; and directs the judgment readily to diſcover any conſiderable error therein, which might otherwiſe eſcape notice. Beſides that, when the ground, or general plan, and the principal parts of a picture are firſt laid down according to the rules, every thing elſe will more naturally fall in with them, and every remarkable deviation from the juſt rules

will be the more readily perceived, and the eaſier avoided or rectified; ſo that although it may be infinitely tedious, or abſolutely impracticable, to deſcribe every minute part of a picture, by the ſtrict mechanical rules; yet the employing them, where they can be the moſt commodiouſly uſed, will give the picture in general ſuch a look, as will guide the artiſt in drawing the other parts without any obvious inconſiſtency.

Without the knowledge of perſpective, a picture is drawn as it were by gueſs, without any certain determinate points, or lines, or any other rule than the judgment of the painter's eye to guide him; here the ſhape and ſituation of his objects are not previouſly determined, but left at large to be modelled as they happen in the progreſs of his work to appear to ſtand beſt: this indeed is the too common way in painters work, as it allows them all kinds of latitude in their deſigns, or rather permits them to paint without any ſettled deſign at all, but as it ſhall happen. If a figure, on examination, appears too large for its diſtance, it is by a ſtroke of a pencil brought to ſtand on nearer ground; mountains are removed from place to place, by raiſing or lowering their foundations, till at laſt the painter fixes them as ſuits beſt with their bulk, and ſtrength of colour which he firſt gave them: as he has no fixed deſign to work by, all he can do is to make his eye the judge, and to correct what, on view, appears to him amiſs; but often, not knowing how to do it, he makes it worſe, and is obliged, after many repeated unſucceſsful trials, to hide that part under a veil, or blot it quite out, and put ſomething elſe in its place that may look better: as he is not ſure of what he really intends, he is obliged to keep others as much in the dark as himſelf, by induſtriouſly avoiding all regular figures and ſtraight lines, and leaving the boundaries of his objects as uncertain as may be; and thus at length the piece is finiſhed, and the painter almoſt as ignorant of the true original, or model of his performance, as the greateſt ſtranger; and, if in this manner it can be completed, without any obvious and groſs faults in it, he is much more beholden to chance and good fortune, than to the rules of the art he profeſſes.

On the other hand a picture, drawn by the rules, may be eaſily reduced to its model; nothing is ambiguous or uncertain in it, but what is ſo in nature; the true diſtance, height, and breadth of every object may be meaſured by a line; the ground and buildings may be reduced to their original plan, and from thence a new picture may be drawn of the ſame things, in any other view. A painter, working by theſe rules, knows what he is about, and lets the ſpectator know it too; he is in no danger of falling into abſurdities, nor does he ſtand in need of blinds and ſhifts to cover his ignorance: if any part of his work hath not a good effect, he knows the fault lies in his model, or deſign, and how, and where, to correct it; and has the pleaſure of working with certainty, without the ſlavery of being obliged to grope out every ſtep of his way, not knowing in the end whether he be right or wrong.

We ſhall now give ſuch rules as are of moſt general uſe in the practice of perſpective. 1. Let every line, which in the object, or geometrical figure, is ſtraight, perpendicular, or parallel to its baſe, be ſo alſo in its ſcenographic delineation. 2. Let the lines, which in the object return at right angles from the fore-right ſide, be drawn ſcenographically from the viſual point. 3. Let all ſtraight lines, which in the object return from the fore-right ſide, run in a ſcenographic figure into the horizontal line. 4. Let the object you intend to delineate, ſtanding on your right-hand, be placed alſo on the right-hand of the viſual point; and that on the left-hand, on the left-hand of the ſame point; and that which is juſt before, in the middle of it. 5. Let thoſe lines which are (in the object) equidiſtant to the returning line, be drawn in the ſcenographic figure, from that point found in the horizon. 6. In ſetting off the altitude of columns, pedeſtals, and the like, meaſure the height from the baſe-line upward, in the front or fore-right ſide; and a viſual ray down that point in the front ſhall limit the altitude of the column or pillar, all the way behind the fore-right ſide, or orthographic appearance, even to the viſual point. This rule you muſt obſerve in all figures, as well where there is a front or fore-right ſide, as where there is none. 7. In delineating ovals, circles, arches, croſſes, ſpirals, and croſs-arches, or any other figure in the roof of any room, firſt draw ichnographically, and ſo with perpendiculars from the moſt eminent points thereof, carry it up unto the ceiling; from which ſeveral points, carry on the figure. 8. The center in any ſcenographic regular figure is found by drawing croſs lines from oppoſite angles; for the point where the diagonals croſs, is the center. 9. A ground-plane of ſquares is alike, both above and below the horizontal line; only the more it is diſtant above or beneath the horizon, the ſquares will be ſo much the larger or wider. 10. In drawing a perſpective figure, where many lines come together, you may, for the directing of your eye, draw the diagonals in red; the viſual lines in black; the perpendiculars in green, or other different colour, from that which you intend the figure ſhall be of. 11. Having conſidered the height, diſtance, and poſition of the figure, and drawn it accordingly, with ſide or angle againſt the baſe; raiſe perpendiculars from the ſeveral angles, or deſigned points, from the figure to the baſe, and transfer the length of each perpendicular, from the place where it touches the baſe, to the baſe on the ſide oppoſite to the point of diſtance; ſo will the diametrals drawn to the perpendiculars in the baſe, by interſection with the diagonals, drawn to the ſeveral transferred diſtances, give the angles of the figures, and ſo lines drawn from point to point will circumſcribe the ſcenographic figure. 12. If in a landſkip there be any ſtanding-waters, as rivers, ponds, and the like, place the horizontal line level with the fartheſt ſight or appearance of it. 13. If there be any houſe, or the like, in the picture, conſider their poſition, that you may find from what point in the horizontal lines to draw the front and ſides thereof. 14. In deſcribing things at a great diſtance, obſerve the proportion, both in magnitude and diſtance, in draught, which appears from the object to the eye. 15. In colouring and ſhadowing of every thing, you muſt do the ſame in your picture, which you obſerve with your eye, eſpecially in objects lying near; but, according as the diſtance grows greater and greater, ſo the colours muſt be fainter and fainter, till at laſt they loſe themſelves in a darkiſh ſky-colour. 16. The catoptrics are beſt ſeen in a common looking-glaſs, or other poliſhed matter; where, if the glaſs be exactly flat, the object is exactly like its original; but, if the glaſs be not flat, the reſemblance alters from the original; and that more or leſs, according as the glaſs differs from an exact plane. 17. In drawing catoptric figures, the ſurface of the glaſs is to be conſidered, upon which you mean to have the reflection: for which you muſt make a particular ichnographical draught, or projection; which on the glaſs muſt appear to be a plane full of ſquares, on which projection transfer what ſhall be drawn on a plane, divided into the ſame number of like ſquares; where though the draught may appear very confuſed, yet the reflection of it on the glaſs will be very regular, proportional, and regularly compoſed. 18. The dioptric, or broken beam, may be ſeen in a tube thro' a cryſtal or glaſs, which hath its ſurface cut into many others, whereby the rays of the object are broken. For to the flat of the cryſtal, or water, the rays run ſtraight; but then they break and make an angle, which alſo by the refracted beams is made and continued on the other ſide of the ſame flat. 19. When theſe faces on a cryſtal are returned towards a plane placed directly before it, they ſeparate themſelves at a good diſtance on the plane; becauſe they are all directed to various far diſtant places of the ſame. See the articles REFLECTION and REFRACTION.

PERSPECTIVE alſo denotes a kind of painting frequently ſeen in gardens, at the ends of galleries, &c. expreſsly deſigned to deceive the ſight.

PERSPECTIVE-GLASS, in optics, differs from a teleſcope in this: inſtead of the convex eye glaſs placed behind the image, to make the rays of each pencil go parallel to the eye, there is placed a concave eye-glaſs as much before it; which opens the converging rays, and makes them emerge parallel to the eye.

The quantity of objects taken in at one view with this inſtrument,

inſtrument, does not depend upon the breadth of the eye glaſs, as in the aſtronomical teleſcope, but upon the breadth of the pupil of the eye.

PERSPECTIVE PLANE, is a glaſs or other tranſparent ſurface ſuppoſed to be placed between the eye and the object, perpendicular to the horizon.

Such is the plane H I (plate XCIV. *fig.* 5.) between the eye O and the object A B C, cutting the optic rays in *a*, *b*, *c*; this is ſometimes called the ſection, table, or glaſs.

PERSPIRATION, in medicine, the evacuation of the juices of the body through the pores of the ſkin. Perſpiration is diſtinguiſhed into ſenſible and inſenſible: and here ſenſible perſpiration is the ſame with ſweating, and inſenſible perſpiration, that which eſcapes the notice of the ſenſes; and this laſt is the idea affixed to the word perſpiration, when uſed alone. The veſſels thro' which perſpiration is performed, lie obliquely under the ſcales of the ſcarf-ſkin, and are ſo inconceiveably ſmall, that from a calculation made by Liewenhoeck, it appears that the mouths of an hundred and twenty-five thouſand of them may be covered with a common grain of ſand. The matter of inſenſible perſpiration is a fine ſubtile fluid, which exhales from the body in the form of a vapour, and proceeds from the whole ſurface and from every cavity: it is of an aqueous and ſaline nature, and ſeems to have a great analogy with urine; becauſe in a healthy ſtate, the increaſe of the one diminiſhes the other. Many experiments prove its exiſtence. If you paſs your finger over a looking glaſs, or any other poliſhed body, it will leave a track of moiſture. If you put your naked head near a white wall, expoſed to the ſun, the ſhadow of the vapours which proceed from the pores of the ſkin, may be plainly ſeen: or if you breathe upon glaſs, you may perceive it covered with ſmall drops of water; and the vapours which proceed from the lungs, are in winter condenſed by the cold, and form a kind of bluiſh miſt, proceeding from the mouth. Other experiments ſhew that the matter evacuated this way, is at leaſt in ſome countries more than equal to all the other evacuations by ſtool, urine, &c. Sanctorius found in Italy, under the circumſtances of a moderate diet, middle age, and eaſy life, that the matter inſenſibly perſpired was five-eighths of that taken in for food: ſo that there only remained three-eighths for nutrition, and for the excrements of the noſe, ears, inteſtines, bladder, &c. The ſame author ſhews, that as much is evacuated by perſpiration in one day, as by ſtool in fourteen days.

But Dr. Bryan Robinſon, of Dublin, has found the caſe very different, both in England and Ireland, and even in South Carolina, in all which places he found that the quantity of urine exceeds that of perſpiration, and that if the meat and drink of one day be four pounds and a half, the perſpiration of that day will be two pounds, the urine two pounds five ounces, and the ſtool three ounces.

The matter of ſweat is ſeparated from the blood by the miliary glands, and is therefore much more groſs than that of inſenſible perſpiration; for as there are no glands which ſerve for the excretion of this laſt fluid, it is ſuppoſed to proceed from the extremities of the capillary arteries.

The uſe of perſpiration is to preſerve the ſuppleneſs of the papillæ of the ſkin; to carry the ſaline particles off from the blood, and by this means to render it more pure; to preſerve the body from various diſeaſes, and to contribute to the cure of the moſt dangerous diſtempers. It may be promoted by exerciſe, by dry frictions with a coarſe linnen-cloth, or a fleſh-bruſh, by warm baths, and waſhing the hands, feet, head, &c.

PERU, formerly a powerful empire in South America, but now a province of Spain, is ſituated between the ſixtieth and eighty-firſt deg. of weſt long. and between the equator and the twenty-fifth of ſouth latitude; being near two thouſand miles in length from north to ſouth, and from two hundred to five hundred broad: it is bounded by Popayan, on the north; by the mountains of Andes, on the eaſt; by Chili and La Plata, on the ſouth; and by the Pacific Ocean on the weſt.

PES FORESTÆ, the foreſt foot, an Engliſh long meaſure, containing eighteen inches.

PESADE, or PESATE, in the manege, is a horſe's raiſing his fore quarters, and bending his feet up to his body without ſtirring his hind feet.

PESSARY, in medicine, a ſolid ſubſtance compoſed of wool, lint, or linen, mixed with powders, oils, wax, &c. made round and long like a finger, in order to be introduced into the exterior neck of the matrix, for the cure of ſeveral diſorders incident to the uterus.

This name is alſo ſometimes given to pieces of cork, or other matters thruſt up the noſtrils, &c. to prevent the entrance of ſtrong infectious ſteams.

PEST-HOUSE, the ſame with lazaretto or lazar-houſe. See LAZAR-HOUSE.

PESTILENCE, in medicine, an epidemical, contagious, and malignant diſeaſe, popularly known by the name of plague. See PLAGUE.

PESTILENTIAL FEVERS, ſuch as are attended with ſome malignant quality, and approach to the nature of the plague. See BILIOUS and HOSPITAL-FEVER.

PETAL, among botaniſts, an appellation given to the flower-leaves, in oppoſition to the folia, or common leaves of the plant.

According to the number of petals in each flower it is ſaid to be monopetalous, or to conſiſt of a ſingle petal; dipetalous, when it has two; tripetalous, when three, &c. See FLOWER.

PETARD, in the art of war, a metalline engine, ſomewhat reſembling a high crowned hat.

The petard may be conſidered as a piece of ordnance; it is made of copper mixed with braſs, or of lead with tin: its charge is from five to ſix pounds of powder, which reaches to within three fingers-breadth of the mouth; the vacancy is filled with tow, and ſtopped with a wooden tampion, the mouth being ſtrongly bound up with cloth tied very tight with ropes. It is covered up with a madrier, or wooden plank, that has a cavity to receive the mouth of the petard, and faſtened down with ropes, as repreſented in plate XCIX. *fig.* 5.

Its uſe is in a clandeſtine attack to break down gates, bridges, barriers, &c. to which it is hung; and this it does by means of the wooden plank. It is alſo uſed in countermines to break through the enemy's galleries, and give their mines vent.

The invention of petards is aſcribed to the French Huguenots, in 1579, who with them took Cahors, as D'Aubigné tells us.

PETARDEER, a perſon who loads, fixes, and fires petards.

PETECHIÆ, in medicine, denote ſpots in the ſkin like flea bites, which come out in malignant fevers, hence called petechial, or ſpotted fevers.

PETER, or *Epiſtles of St.* PETER, two canonical books of the New Teſtament, written by the apoſtle St. Peter, and addreſſed to thoſe Jewiſh converts who were ſcattered throughout Pontus, Galatia, &c. not only upon the perſecution raiſed at Jeruſalem, but upon former diſperſions of the Jews into thoſe places. The firſt of theſe epiſtles is principally deſigned to comfort and confirm them under thoſe fiery trials they were then ſubject to; and to direct them how to behave in the ſeveral ſtates and relations, both of the civil and the Chriſtian life. In the ſecond epiſtle, the apoſtle proſecutes the ſame ſubject, to prevent their apoſtacy from the faith, and guard them againſt the corrupt principles of the Gnoſtics, and thoſe who ſcoffed at the promiſe of Chriſt's coming.

St. PETER'S DAY, a feſtival of the Chriſtian church, obſerved on the twenty-ninth of June.

PETER-PENCE, an ancient tax of a penny on each houſe, paid to the pope.

PETIOLE, *Petiolum*, in botany, the ſlender ſtalk that ſupports the leaves of a plant.

Some alſo uſe the word petiole for the middle rib of a leaf; the branches of which are called rami, and the ſubdiviſions of theſe ſurculi.

PETITIO PRINCIPII, in logic, the taking a thing for true, and drawing concluſions from it as ſuch; when it is really falſe, or at leaſt wants to be proved, before any inferences can be deduced from it.

PETITION, a formal ſupplication or requeſt made by an inferior to a ſuperior, eſpecially to one having ſome juriſdiction.

PETRE,

PETRE, or SALT-PETRE, the ſame with nitre. See NITRE.

PETRIFACTION, in phyſiology, denotes the converſion of wood, bones, and other ſubſtances into ſtone.

PETROBRUSSIANS, in church-hiſtory, a religious ſect which aroſe in France and the Netherlands, about the year 1126, ſo called from their leader Peter Bruys.

They denied that children, before the uſe of reaſon, can be juſtified by baptiſm.

They alſo condemned all places of public worſhip, croiſes, crucifixes; and are ſaid to have rejected the ſacrament of the euchariſt, and prayers for the dead.

PETROLEUM, alſo called oil, or oil of petre, is an extremely ſubtile and penetrating fluid, and is by much the thinneſt of all the native bitumens.

Petroleum is found in rivers, in wells, and trickling down the ſides of hills along with little ſtreams of water. In ſhort, it is the moſt frequent of all the liquid bitumens, and is perhaps the moſt valuable of them all in medicine. It is to be choſen the pureſt, lighteſt, and moſt pellucid that can be had, ſuch as is of the moſt penetrating ſmell, and is moſt inflammable.

It is principally uſed externally, in paralytic caſes, and in pains of the limbs.

PETRONEL, a ſort of harquebuſs, or hand-gun. See HARQUEBUSS.

PETROSA OSSA, in anatomy, a name given to the fourth and fifth bones of the cranium, called alſo oſſa temporum, and oſſa ſquamoſa; the ſubſtance whereof, as their firſt and laſt names expreſs, is ſquamoſe and very hard.

PETTY-BAG, an office in chancery, the three clerks of which record the return of all inquiſitions out of every county, and make all patents of comptrollers, gaugers, cuſtomers, &c.

PETTY-FOGGER, a little, tricking ſolicitor or attorney, without either ſkill or conſcience.

PETUNSE, in natural-hiſtory, one of the two ſubſtances of which the porcelain or china ware is made.

The petunſe is a coarſe kind of flint or pebble, the ſurface of which is not ſo ſmooth, when broken, as that of our common flint.

PEWTER, a factitious metal, uſed in making domeſtic utenſils, as plates, diſhes, &c.

The baſis of this metal is tin, which is converted into pewter, by mixing at the rate of an hundred weight of tin with fifteen pounds of lead and ſix pounds of braſs.

Beſide this compoſition, which makes the common pewter, there are other kinds compounded of tin, regulus of antimony, biſmuth and copper, in ſeveral proportions.

PHÆNOMENON, in philoſophy, an extraordinary appearance in the heavens or earth, either by obſervation of the celeſtial bodies, or by phyſical experiments, whoſe cauſe is not obvious.

The word is Greek, and derived from φαινω, to appear.

Such are meteors, comets, earthquakes, effects of the magnet, &c.

Sir Iſaac Newton ſhews, that all the phænomena of the heavenly bodies follow from the attraction of gravity, and almoſt every phænomenon of the leſſer bodies from the attraction and repulſion between their particles. See ATTRACTION.

PHAGEDÆNA, φαγεδαινα, in ſurgery, denotes a corroding ulcer. See ULCER.

PHAGEDÆNIC MEDICINES, thoſe uſed to eat off fungous or proud fleſh; ſuch are all the cauſtics.

PHALANX, in Grecian antiquity, a ſquare battalion, conſiſting of eight thouſand men, with their ſhields joined, and pikes croſſing each other; ſo that it was next to impoſſible to break it.

PHALEUCIAN VERSE, in ancient poetry, a kind of verſe which conſiſts of five feet, the firſt of which is a ſpondee, the ſecond a dactyl, and the three laſt trochees.

PHANATIC, a term of reproach formerly given to the diſſenters, from a falſe ſuppoſition that they pretended to viſions, &c.

PHANTASM, φαντασμα, a term ſometimes uſed in a ſynonymous ſenſe with idea, or the notion retained in the mind of an external object. See IDEA.

PHANTASTIC STYLE, in muſic, denotes a free and eaſy manner of compoſition, proper for inſtruments.

PHANTASY, or FANCY, the ſame with imagination. See IMAGINATION.

PHARISEES, a famous ſect of the Jews, who diſtinguiſhed themſelves by their zeal for the traditions of the elders, which they derived from the ſame fountain with the written word itſelf; pretending that both were delivered to Moſes from Mount Sinai, and were therefore both of equal authority. From their rigorous obſervance of theſe traditions, they looked upon themſelves as more holy than other men, and therefore ſeparated themſelves from thoſe whom they thought ſinners or prophane, ſo as not to eat or drink with them; and hence, from the Hebrew word *pharis*, which ſignifies to ſeparate, they had the name of Phariſees, or ſeparatiſts.

Their pretences to extraordinary piety drew after them the common people, who held them in the higheſt eſteem and veneration. They held a reſurrection from the dead, and the exiſtence of angels and ſpirits; but, according to Joſephus, this was no more than a Pythagorean reſurrection, that is, of the ſoul only, by its tranſmigration into another body, and being born anew with it. From this reſurrection they excluded all who were notoriouſly wicked, being of opinion, that the ſouls of ſuch perſons were tranſmitted into a ſtate of everlaſting woe: but as to leſſer crimes, they imagined they were puniſhed in the bodies which the ſouls of thoſe who committed them were next ſent into.

According to this notion it was, that Chriſt's diſciples aſked him, concerning the blind man, "Who did ſin, "this man or his parents, that he was born blind?" With the Eſſenes, they held abſolute predeſtination; and with the Sadducees, free-will: but how they reconciled theſe ſeemingly incompatible doctrines, is no where ſufficiently explained.

PHARMACEUTICA, pharmaceutics, that part of medicine, which gives the deſcription of remedies, and teaches the method of rightly exhibiting them.

The word is Greek, and formed of φαρμακευω, to uſe purging medicines.

PHARMACOCHEMIA, that part of chemiſtry which teaches the preparation of chemical medicines, by way of diſtinction from the ſpagirical part, which treats of the tranſmutation of metals.

PHARMACOLOGY, *Pharmacologia*, a treatiſe of medicines, of the art of preparing them, judging of them, &c.

The word is formed of the Greek, φαρμακον, medicine, and λογος, account of.

PHARMACOPOEIA, a diſpenſary, a treatiſe deſcribing the preparations of the ſeveral kinds of medicines, with their uſes, manner of application, &c.

The word is formed of the Greek, φαρμακον, medicine, and ποιεω, to make.

We have various Pharmacopæias, but Quincy's *Pharmacopæia Officinalis & Extemporanea* is reckoned the beſt.

PHARMACOPOLA, an apothecary, or perſon who prepares and ſells medicines.

The word is formed of the Greek, φαρμακον, medicine, and πωλεω, to ſell.

PHARMACY, the art or ſcience which teaches the election, preparation, and mixtures of medicines; conſtituting one part of the therapeutic branch of medicine, the objects of which are all natural bodies.

PHAROS, or PHARE, a light-houſe. See the article LIGHT-HOUSE.

PHARYNX, in anatomy, the upper part of the œſophagus. See OESOPHAGUS.

The muſcles of the pharynx ſerve to open or ſhut the œſophagus: theſe are in number three pair, viz. the ſtylopharyngæus, the pterygopharyngæus, and the œſophagæus.

PHASES, φασεις, in aſtronomy, the ſeveral appearances or quantities of illumination of the moon, Venus, Mercury, and the other planets; or the ſeveral manners

wherein they appear illuminated by the ſun. See the articles MOON, MERCURY, VENUS, &c.

PHASMATA, in phyſiology, certain appearances ariſing from the various tinctures of the clouds, by the rays of the heavenly luminaries, eſpecially the ſun and moon. Theſe are infinitely diverſified by the different figures and ſituation of the clouds, and the appulſes of the rays of light.

PHEASANT, *Phaſianus*, in ornithology, a genus of birds of the order of the gallinæ, with the ſpace about the eyes naked, and no wattles.

PHELLANDRIUM, WATER-HEMLOCK, in botany, a genus of plants, the general corolla whereof is nearly uniform; the ſingle flowers are unequal; they are compoſed each of five acuminated cordato-inflex petals; the fruit is naked, ſmooth, and coronated with the perianthium and piſtils; it is ſeparable into two parts: the ſeeds, are two, oval and ſmooth.

PHEONS, in heraldry, the barbed heads of darts, arrows, or other weapons.

PHIAL, a ſmall thin glaſs-bottle, vulgarly called a vial.

PHILIPPICS, φιλιππικοι λογοι, in literature, a name given to the orations of Demoſthenes againſt Philip king of Macedon; being eſteemed the maſter-pieces of that great orator.

Philippic is alſo a term applied to the fourteen orations of Cicero againſt Mark Antony.

PHILIPPINES, a religious ſociety of young women, at Rome; ſo called from their taking St. Philip de Neri for their protector: they conſiſt of an hundred poor girls, who are brought up till they are of age to be married, or become nuns, under the direction of ſome religious women, who teach them to read, write, and work; and inſtruct them in the duties of Chriſtianity. They wear a white veil, and a black croſs on their breaſts.

PHILLYREA, or PHYLLYREA, in botany, a genus of plants, the corolla whereof conſiſts of a ſingle petal, divided into four ſhort ſegments at the limb; the fruit is a globoſe berry, with only one cell, in which is a ſingle large ſeed, of the ſame ſhape.

The leaves and bark of this ſhrub are ſaid to be aſtringent, and good in ulcers of the mouth; but they are little regarded in the preſent practice.

PHILOLOGY, an aſſemblage of ſeveral ſciences, conſiſting of grammar, rhetoric, poetry, antiquities, hiſtory, and criticiſm.

The word is formed of the Greek, φιλος, lover, and λογος, diſcourſe.

It is a kind of univerſal literature converſant about all the ſciences, their riſe, progreſs, authors, &c. being what the French call the belles lettres. It is called in the univerſities *humanities*, or *literæ humaniores*.

Eratoſthenes, library-keeper at Alexandria, under Ptolemy Philadelphus, was the firſt, according to Suetonius, that was called philologus, or critic, according to Clemens Alexandrinus.

PHILOMATHES, a lover of learning or ſcience.

The word is formed of the Greek, φιλος, lover, and μανθανω, to learn.

PHILONIUM, in pharmacy, a kind of ſomniferous anodyne opiate, taking its name from Philo the inventor.

PHILOSOPHER, a perſon well verſed in philoſophy, or who applies himſelf to the ſtudy of nature and morality.

The word is formed from the Greek, φιλοσοφος, which is compounded of φιλος, a lover, and σοφος, wiſdom.

PHILOSOPHERS-STONE, in alchemy, a long ſought for preparation, which is to tranſmute or exalt impurer metals, ſuch as tin, lead, and copper, into gold and ſilver.

There are three ways whereby the alchemiſts have attempted to arrive at the making of gold; the firſt by ſeparation, the ſecond by maturation, and the third by tranſmuting or turning of all metals readily into pure gold, by melting them in the fire, and caſting a little quantity of a certain preparation into the fuſed matter, upon which the fæces are volatilized and burnt, and the reſt of the maſs turned into pure gold. Whether this third method be poſſible, is very hard to ſay. One natural argument will ſuffice to ſhew the vain pretences of making gold by art. Very plain receipts have been laid down on this ſubject, but, after ten thouſand experiments according to theſe directions, they have always failed of ſucceſs; or, if there was any little gold found, the quantity was ſo ſmall, that it did not near anſwer the trouble and expence, nor give any encouragement to repeat the operation.

PHILOSOPHIC, or PHILOSOPHICAL, ſomething that relates to philoſophy.

PHILOSOPHIC CHEMISTRY is defined by Shaw, an art of dividing or reſolving all the bodies in our power, by means of all the inſtruments that can be procured, and that as well into integrant as into conſtituent parts, and joining theſe parts together again, ſo as to diſcover the principles, relations, and changes of bodies, make various mixtures and compoſitions, find out the phyſical cauſes of phyſical effects; and hence improve the ſtate of natural knowledge, and the arts depending on it. See the article CHEMISTRY.

PHILOSOPHICAL EGG, among chemiſts, a thin glaſs-body, or bubble, of the ſhape of an egg, with a long neck or ſtem, uſed in digeſtions.

PHILOSOPHY, φιλοσοφια, the knowledge or ſtudy of nature and morality, founded on reaſon and experience.

Philoſophy, among the ancients, was uſed in various ſenſes: for, 1. It ſometimes was taken for univerſal knowledge, viz. of all things human and divine. 2. In a ſtricter notion, for the contemplation of nature only; and in this ſenſe a philoſopher was called by Plato φιλος της φυσεως, i. e. a friend and lover of nature. 3. Sometimes for ethics, or the doctrine of manners, which we call moral philoſophy. 4. It included alſo the mathematical arts and diſcipline, eſpecially arithmetic and geometry. 5. The doctrine of exiſtence, or *being* in the abſtract, called metaphyſics. 6. For the knowledge της πρωτης καλης, i. e. of the prime or chief good, viz. God; and this was their prima philoſophia, or theology. 7. It was ſometimes applied to logics or dialectics, which gave rules for reaſoning about the nature of things.

Philoſophy may be divided into three parts, intellectual, moral, and phyſical.

The intellectual part comprizes logics and metaphyſics; the moral part contains the laws of nature and nations; and, laſtly, the phyſical part comprehends the doctrine of bodies animate or inanimate. Theſe, with their various ſubdiviſions, will take in the whole of philoſophy. See LOGICS, METAPHYSICS, ETHICS, POLITICS, &c.

Wolfius makes the three parts of philoſophy to be the doctrine of God, the human ſoul, and of bodies: however, when he ſubdivides, and comes to treat of the ſeveral branches ſeparately, his diviſions readily come under the three heads, intellectual, moral, and phyſical, beforementioned.

For the method of philoſophizing, or the rules for that purpoſe, as eſtabliſhed by Sir Iſaac Newton, ſee the article EXPERIMENTAL PHILOSOPHY.

From the firſt broachers of new opinions, and the firſt founders of ſchools, philoſophy is become divided into innumerable ſects, ſome ancient, others modern; ſuch are the Platoniſts, Peripatetics, Epicureans, Stoics, Pyrrhonians, and Academics; and ſuch are the Carteſians, Newtonians, &c. See the riſe and doctrines of each ſect under its proper head, PLATONIC, PERIPATETIC, EPICUREAN, STOIC, PYRRHONIAN, ACADEMIC, CARTESIAN, NEWTONIAN, &c.

PHILTER, FILTER, in pharmacy. See the article FILTER.

PHILTER, or PHILTRE, φιλτρον, is more particularly uſed for a love-potion, or medicine to excite love. See the article PROVOCATIVES.

PHIMOSIS, in medicine, a diſorder of the penis, in which the prepuce is rendered ſo ſtrict or tenſe, that it cannot be drawn back over the glans.

The general cauſe of a phimoſis is, by phyſicians, rightly aſcribed to impure coition; for while the virulent matter, which had been lodged in the ſinuſes of the vagina, continues between the ſkin and glans, the prepuce, eſpecially if it be long or tight, can hardly eſcape being ſwelled with an inflammation, and a phimoſis muſt

be induced. Some, however, have the foreſkin naturally ſo long, and ſo ſtraight, that the glans can either be not at all or very little uncovered; but as this neither occaſions trouble in diſcharging the urine, nor any impediment in procreation, it requires no aid from the ſurgeon, unleſs it be attended with inflammation, violent pain, or any remarkable inconvenience in coition.

PHLEBOTOMY, in ſurgery, the opening a vein with a proper ſharp-edged and pointed inſtrument of ſteel in order to let out a proper quantity of blood, either for the preſervation or recovery of a perſon's health.

Phlebotomy, or bleeding, appears to be not only one of the moſt uſeful, but one of the moſt ancient operations in ſurgery, and is frequently performed in different parts of the body, as the foot, the forehead, temples, neck, tongue, penis, and the other parts, yet is moſt generally performed in that vein of the inſide of the arm, which lies near the joint of the cubit, and therefore we ſhall begin with ſhewing the method of opening this vein. See VEIN.

The ſurgeon having tied on a fillet, about a hand's breadth above the bend of the cubit; and the veins being compreſſed and enlarged, by the blood's being ſtopped in its return, he is to examine which vein lies faireſt, and is therefore moſt proper to be opened. In the arm are three principal veins; the firſt or uppermoſt of which is called the cephalic vein, the undermoſt the baſilic vein, and that in the middle the median. And here it is obſerved, that the median and baſilic veins, as they are larger than the cephalic, diſcharge a greater quantity of blood, but are attended with more danger in the operation; for a conſiderable artery and the brachial nerve lie under the baſilic vein, and the tendon of the biceps muſcle under the median; but as they lie fairer to the eye, it is ſafer for the unexperienced ſurgeon to open the cephalic, or at leaſt the median vein; but ſometimes the veins are ſo ſituated as to deprive him of all choice. When the veins are not riſen, it will be proper to rub the arm below the bandage, to drive up the blood, and render the veins more turgid: while this is doing, the ſurgeon ſhould lay his thumb on the vein he intends to open, to prevent the blood from flowing back, and to keep the vein from rolling; and then holding the lancet, ſo that the thumb and firſt finger may be fixed about the middle of the blade, the other fingers ſhould reſt gently upon the patient's arm, to prevent his hand from ſlipping. The lancet is now to be puſhed lightly and carefully forward by the thumb and fore-finger, till it has penetrated through the coats of the vein, and at that inſtant to be raiſed a little upwards in order to enlarge the orifice of the wound, and give a freer paſſage to the blood. When there ſeems to be a ſufficient quantity of blood diſcharged, the ligature muſt be immediately taken off, from above the elbow, and the ſkin about the orifice muſt be gently preſſed together, by which means the lips of the divided vein are eaſily cloſed, and the little blood that may remain between the orifice and the vein diſcharged: one or two compreſſes are then put on, which the ſurgeon preſſes gently on the orifice with his left thumb, till the bandage is laid acroſs it, which is afterwards faſtened by turning it round the arm, both above and below the elbow, and tying both together.

In bleeding in the foot, it muſt be obſerved, that the veins proper for this operation, are the ſaphena and cephalica, the laſt of which extends itſelf from the internal ancle to the great toe; and the firſt, from the external malleolus to the ſmaller toes: bleeding in each of which is attended with the ſame effect: but if the veins upon the metatarſus, or inſtep, do not fully appear, it may be convenient to open one of thoſe at the ancle, or about the calf or ham of the leg, where the phlebotomiſt is not ſo liable to injure any of the tendons, as in the metatarſus. For the more eaſy apertion of theſe veins, the patient muſt firſt waſh both feet in warm water; and the ſurgeon having fixed upon the particular foot and vein, which appears moſt turgid, he applies a ligature about two fingers-breadth, above the ancle, or where he intends to open the vein, and puts it in the warm water again, while he takes out his lancet. Then kneeling down on one knee, he takes out the foot, and, it being wiped dry, places it on the other knee, or upon a board laid over the veſſel of warm water, and, ſecuring the vein from ſlipping with the thumb of his left hand, makes the orifice; but if the patient does not bleed freely, puts the foot again in the warm water, till he judges, by its colour, and the ſtrength of the patient, that a ſufficient quantity of blood has been drawn; the orifice is then to be cloſed by the thumbs, and, after drying the foot with a napkin, to be ſecured by compreſſes and a bandage.

In bleeding in the jugular veins of the neck, a ſtricture muſt be made round the lower part of the neck, with a neck-cloth or handkerchief, or the common ligature, to make the vein turgid or conſpicuous, and then either of the jugular veins being ſecured by the thumb, the inciſion muſt be made, and the requiſite quantity of blood being taken away, the ligature muſt be removed, and the orifice compreſſed with the thumb, if the blood does not ſtop without, while the neck is wiped clean; after which the compreſs and circular bandage muſt be applied. It is to be obſerved, that if the diſorder lies in the whole head, or in the neck and fauces, the orifice may be made either in the right or left ſide indifferently; but when only one ſide of the head, or one eye is affected, the vein ought to be opened on that ſide in which the diſorder lies.

In bleeding in the veins of the forehead, temples, and occiput, a ſtricture muſt be made round the neck, and the ſame method uſed as in opening the jugular veins; only obſerving that the patient muſt hold down his head, to prevent the blood trickling into his eyes, &c.

In bleeding in the veins called ranulæ under the tongue, a ſtricture muſt be made round the neck, as before; you then elevate the apex of the tongue with your left hand, while with the lancet in your right hand, you circumſpectly open firſt one, and then the other, on each ſide; becauſe the apertion of one only will hardly ever diſcharge blood enough to give any conſiderable relief. When you judge that a ſufficient quantity of blood has run out of the mouth into the veſſel, remove the ligature from the neck, upon which the flux uſually ſtops of itſelf; but if it ſhould ſtill continue, let the patient take a little vinegar or Frontiniac wine in his mouth, and hold it there till the hæmorrhage ceaſes, which cannot be dangerous, even without ſuch topics. In bleeding in the vena dorſalis penis, which runs along the upper ſide of the penis, and is generally pretty much diſtended, and conſpicuous in an inflammation of this part, it is to be obſerved that it muſt be opened about the middle, and kept bleeding till the member becomes flaccid, and a ſufficient quantity of blood is diſcharged; which done, you muſt apply a compreſs, and the bandage proper for the penis. But you muſt carefully endeavour to avoid injuring the arteries or nerves which enter the penis near this vein; as alſo not to make your bandage too ſtrict; for by this means, the inflammation and ſymptoms may turn out worſe than before.

PHLEGM, φλεγμα, in the animal œconomy, one of the four humours whereof the ancients ſuppoſed the blood to be compoſed. See BLOOD.

PHLEGMAGOGUES, in pharmacy, ſuch medicines as purge off phlegm, ſuch are hermodactyls, agaric, turbith, jalap, &c. See HYDRAGOGUES.

PHLEGMATIC, among phyſicians, an appellation given to that temperament, or habit of the body, wherein phlegm is predominant; which gives riſe to catarrhs, coughs, &c.

PHLEGMON, in ſurgery, denotes an external inflammation and tumour, attended with a burning heat, &c. See the article INFLAMMATION.

The word is Greek, φλεγμονη, which is derived from the Greek, φλεγω, to burn.

PHLYCTÆNÆ, in medicine, ſmall eruptions on the ſkin, ariſing from an hot or acrimonious humour. Hippocrates ſometimes repreſents them as reſembling thoſe puſtules which appear after ambuſtions.

PHOCA, the ſea-calf, in zoology, a genus of quadrupeds of the order of the feræ: the fore-teeth in the upper jaw are ſix, thoſe in the under jaw are only four: the feet have each five toes, and are palmated, and made for ſwimming; there are no ears.

PHOENIX, in aſtronomy, one of the conſtellations of the ſouthern hemiſphere unknown to the ancients, and inviſible in our northern parts. This conſtellation is ſaid to conſiſt of thirteen ſtars. It took its name from that of a bird

a bird famous among the ancients, but generally looked upon by the moderns as fabulous. The ancients ſpeak of this bird as ſingle, or the only one of its kind: they deſcribe it as of the ſize of an eagle; its head finely creſted with a beautiful plumage, its neck covered with feathers of a gold colour, and the reſt of its body purple, only the tail white, and the eyes ſparkling like ſtars; they hold that it lives five or ſix hundred years in the wilderneſs; that when thus advanced in age, it builds itſelf a pile of ſweet wood and aromatic gums, and fires it with the waſting of its wings, and thus burns itſelf; and that from its aſhes ariſes a worm, which in time grows up to be a phoenix.

PHOENIX, the great palm, or date-tree, in botany, a genus of plants, the characters of which are not yet perfectly aſcertained: the male and female flowers are on diſtinct plants, or on the ſame ſpadix. In the male flowers the general ſpatha is compoſite; the ſpadix is ramoſe; the corolla is deeply divided into three hollow oval ſegments; the ſtamina are three ſlender filaments. In the female flowers the calyx is the ſame as in the male; the corolla is divided into three principal ſegments, with as many very ſmall laciniæ: the fruit is an oval berry, having only one cell, and in that a ſingle oſſeous ſeed, of a ſub-oval figure, with a longitudinal furrow.

PHOLAS, a ſhell-fiſh of the multivalve-kind, compoſed of five pieces, three of which are very ſmall, ſo that they ſeem to a ſuperficial obſerver to be made up of only two ſhells.

The animal inhabiting the pholas is called tethys. They inhabit holes made in ſtones and other ſolid bodies, as corals, the bottoms of ſhips, &c. whence all ſhell-fiſh living in this manner have been commonly called pholades, ſince there are muſcles and chamæ found lodged in the ſame manner.

PHONICS, φωνιχη, the doctrine or ſcience of ſounds, otherwiſe called acouſtics. See SOUND.

PHOSPHORUS, in phyſiology, a denomination given to all bodies which ſhine and ſeem to burn, without having any degree of heat.

Chemiſtry, ſays Dr. Shaw, hath ſcarce afforded any thing more ſurpriſing than the common phoſphorus. To ſee letters traced with this matter become luminous in the dark, images and the bodies of men to blaze with light, and abundance of the like experiments performed by means of phoſphorus, muſt awaken the curioſity of thoſe who have ſeen theſe experiments, and render them deſirous of being acquainted with the method of preparing it. The preparation, even to this day, is kept as a ſecret in few hands, and the matter ſold at a very great price; whence we apprehend it would be no unacceptable preſent to the world, to render this commodity cheaper, and diſcover its farther uſes.

The ſucceſsful method of preparing the phoſphorus of urine is this: Evaporate any quantity of freſh urine over a gentle fire, to a black and almoſt dry ſubſtance; then, with two pounds thereof, thoroughly mix twice its weight of fine ſand; put this mixture into a ſtrong coated ſtone long-neck; and having poured a quart or two of clear water into a large receiver, join it to the long-neck, and work it in a naked fire: let the heat be ſmall for the firſt two hours; then increaſe it gradually to the utmoſt violence; and continue this for three or four hours ſucceſſively: at the expiration of which time, there will paſs into the receiver a little phlegm and volatile ſalt, much black and fœtid oil, and, laſtly, the matter of phoſphorus, in form of white clouds, which either ſtick to the ſides of the receiver, like a fine yellow ſkin, or fall to the bottom in form of ſmall ſand. Now let the fire go out, but let the receiver continue till all be cold, leſt the phoſphorus take fire on the admiſſion of the air. To reduce theſe ſmall grains into one piece, put them into a little tin ingot-mould, with water; heat the ingot to make the grains melt together; then add cold water, till the matter is congealed into one ſolid ſtick, like bees-wax; which being cut into ſmall pieces, fit to enter the mouth of a vial, may be preſerved by water, and keeping the glaſs cloſe ſtopped. If the glaſs were not to be ſtopped, the phoſphorus would turn black on its ſurface, and at length be ſpoiled.

The cautions required to make this proceſs ſucceed, are, 1. To evaporate the urine, while it is recent. 2. To prevent its boiling over, and by that means loſing the moſt unctuous part. 3. To let the matter afterwards ferment in the cold. 4. To mix the black matter with the ſand, to prevent its melting and running over. 5. To uſe a ſtone long-neck, thoſe of earth being too porous, and ſuffering the phoſphorus to tranſude ſooner than paſs into the receiver. 6. To have the receiver very large, and with a very long-neck, to prevent its breaking and over-heating, which would either evaporate the white vapour wherein the phoſphorus conſiſts, or elſe prevent its coagulating. 7. To put water into the receiver, for keeping it cool, and quenching the phoſphorus, as it falls to the bottom. 8. To make the fire ſmall at firſt, that the long-neck may be preſerved, and the black matter gradually dried; which would otherwiſe ſwell and run over in a black froth. 9. Laſtly, it is found neceſſary, that the urine for the operation be of ſuch as drink malt-liquors, rather than wine. All theſe circumſtances being required for obtaining the phoſphorus to advantage, it is no wonder that ſo many of thoſe who attempted it, miſcarried.

This operation may be greatly ſhortened, by freezing and concentrating freſh urine; afterwards evaporating it with care; then digeſting it in the manner above-mentioned. When thoroughly digeſted, commit the matter, in a large quantity, to an iron-pot, with an earthen head, as the chemiſts uſually do for making ſpirit of hartſhorn, or the ſpirit and ſalt of urine: and when, by this method, all the ſalt and oil are obtained, let the caput mortuum be taken out, and mixed with twice its own weight of alum. The matter may now be put into well-coated long-necks, and worked with care in a reverberatory furnace, into very large receivers filled with water, and connected to the long-necks by adopters, the lower ends whereof may enter the water, as in diſtilling of quickſilver; the operation being continued eight or ten hours. And this is apprehended to be the beſt way, hitherto known, of procuring phoſphorus to advantage.

PHOTINIANS, a ſect of Chriſtians in the fourth century, ſo called from Photinus, their chief, who was biſhop of Sirmich, and maintained that Jeſus Chriſt was true man, but not true God, nor born before all ages; and that he only began to be Chriſt when the Holy Spirit deſcended upon him in the river Jordan. Theſe doctrines were condemned in ſeveral aſſemblies, and particularly by the Arians in a ſynod held at Sirmich in the year 351.

PHRASE, φραϛις, in grammar, a manner of ſpeech peculiarly adapted to certain occaſions, arts, languages, &c.

Sometimes the word phraſe is uſed for a ſhort ſentence. See SENTENCE.

PHRASEOLOGY, in matters of literature, a collection of the phraſes, and elegant expreſſions, in any language.

PHRENES, φρενες, in anatomy, the name by which Hippocrates, and the ancient phyſicians, called the diaphragm, as ſuppoſing it to be the ſeat of the rational ſoul. See the article DIAPHRAGM.

PHRENETIC VESSELS, in anatomy, the nerves, arteries, and veins which are ſpread over the diaphragm. The phrenetic nerves ariſe from the cervical ones; the phrenetic arteries ariſe out of the deſcending aorta, and are diſtributed through the diaphragm and pericardium; and the two phrenetic veins diſcharge their contents into the vena cava.

PHRENSY, φρενιτις, in medicine, an inflammation of the membranes of the brain, attended with an acute fever and delirium.

This diſeaſe, ſays Arbuthnot, requires the ſpeedieſt applications of all others; profuſe hæmorrhages of the noſe often reſolve it; and copious bleeding in the temporal arteries, is the moſt efficacious remedy. The diet ſhould be water-gruel, acidulated; and the drink barley-water, ſmall beer, or the decoction of tamarinds.

According to Boerhaave, varices of the veins, or the bleeding piles, are beneficial: a looſeneſs is likewiſe good; and a violent cough, or hæmorrhage, often put an end to the diſeaſe. He therefore adviſes plentiful bleeding, through a large orifice, or to open ſeveral veins

the ſame time, as the jugular, frontal, and a vein in the foot.

Hoffman, from experience, prefers bleeding at the noſe, procured by thruſting up a ſtraw, a pen, or a ſkewer. But if this diſeaſe proceeds from a ſuppreſſion of the lochia or menſes, ſpeedy and copious bleeding in the foot is neceſſary; and if from a ſtoppage of the bleeding piles, leeches muſt be applied to the hæmorrhoidal veins. After bleeding, cathartics are proper; among which, the following is preferable to all others: take of manna, four ounces; of cream of tartar, two drams; of nitre, half a dram; of oil of ſweet almonds, an ounce: all which are to be taken in a pound of whey. The drink alſo ſhould be freſh whey. Emulſions of the four cold ſeeds with barley-water, adding to every quart two ſcruples of nitre, are alſo convenient.

Externally, warm baths are proper for the feet; or linnen-cloths may be dipped in hot-water, and applied to the feet. But eſpecially let the head be ſhaved all over, and embrocated with a mixture of the beſt vinegar, two ounces; camphorated ſpirit of wine, two drams; purified nitre, two ſcruples; and oil of rhodium-wood, twenty drops. Antiphlogiſtic clyſters are alſo proper.

But if all theſe means fail, recourſe muſt be had to cupping in the lower parts, to opiates and mild bliſters: though Hoffman thinks the two latter hurtful; and Boerhaave adviſes the phyſician to conſider well, if the caſe be ſymptomatical, how far the foregoing method, or any part of it, is conſiſtent with the primary diſeaſe.

PHTHIRIASIS, φθειριασις, in medicine, the pedicularis morbus, or louſy diſeaſe, is moſt incident to children, though adults are not wholly exempt from it.

Cleanneſs and wholeſome food are beſt for preventing this diſorder, which may be cured by waſhing the body with a lixivium of wormwood, ſtaves-acre, leſſer centaury, and oak-aſhes; adding ſome common ſalt. All the bitters, ſour and ſalt things, are here recommended; as is alſo mercury, which infallibly deſtroys theſe vermin; but it ought to be uſed with great caution, even by adults, and ſhould never be uſed in applications to children.

PHTHISIS, φθισις, a ſpecies of conſumption ariſing from an ulcer of the lungs. See the article CONSUMPTION.

The ſigns of an approaching phthiſis, according to Morton, is a dry cough, which may continue for ſome months; whereas a ſimple catarrh is attended with ſpitting, and is but of ſhort duration. Vomiting, or a diſpoſition to vomit after eating, excited by the above-mentioned cough, is a moſt certain ſign of a phthiſis.

In the firſt ſtage of a conſumption, when the patient is afflicted with a continual cough, eſpecially in the night time, the defluxion upon the lungs is to be ſtopped by bleeding, by repeated draughts of oxymel of ſquills and oil of ſweet almonds, of each an ounce, to be taken in large draughts of poſſet-drink; after which an opiate, made of two ounces of the ſimple elxiterial water, half an ounce of ſimple cinnamon-water, and ſix drams of the ſyrup of poppies will be proper; or the patient may take ſix or ten of the ſtorax pills. It will alſo be convenient to carry down the impurities by ſtool, with a gentle cathartic. Diaphoretics likewiſe are not to be neglected; nor muſt thoſe remedies that ſoften, lubricate, thicken, and concoct the phlegm be omitted; as ſugar-candy, barley-ſugar, old conſerve of roſes, liquorice-juice, the white and black troches of the London-diſpenſatory, freſh butter, in water-gruel, ſweet oil of ſweet almonds, and eſpecially linſeed oil cold drawn, of which the patient may take a ſpoonful every hour, unleſs there is a diarrhœa, or other ſymptom that forbids it. He may alſo eat raiſins and figs, and uſe the other medicines commonly preſcribed for coughs. See COUGH.

In the ſecond ſtage, when the vomica is formed, but not ſuppurated, evacuations of all kinds are pernicious. The patient ſhould continue the uſe of the pectoral medicines, and eſpecially the balſamic pills, milk-diet, and the chalybeate-waters; of which he ſhould drink only four, or at moſt ſix pints in a day, and a little at a time: and this courſe ſhould be continued for ſeveral years.

But whether a milk-diet be uſed alone, or mixed with mineral waters, Hoffman thinks it highly neceſſary to attend to the following particulars: 1. We ought diligently to enquire whether the ſtrength of the ſtomach is ſufficient to digeſt and again expel this ſpecies of medicine. 2. It is expedient that, before the uſe of the milk, the primæ viæ ſhould be well cleanſed from viſcid and acid humours; which intention is moſt effectually anſwered by a laxative infuſion of manna, whoſe virtue is augmented by adding a ſufficient quantity of tartar. 3. On the firſt days, it is expedient every morning about ſix or ſeven, and every afternoon, about five o'clock, to drink ſix or eight ounces of women's or aſſes-milk, and afterwards gradually to increaſe the quantity. 4. After the patient has for ſix or eight days drank the milk in this manner, a gentle laxative medicine, and ſuch as has a tendency to evacuate the ſordes, is to be interpoſed and repeated every ſixth day. 5. He ought never to uſe wine or malt-liquors for drink, but rather ptiſans of barley, hartſhorn, and citron-peel. He muſt alſo carefully abſtain from aliments of hard digeſtion, and ſuch as generate bad juices. On the contrary, broth prepared of tortoiſes, cray-fiſh, veal, fowls, lettuce, and garden ſuccory, are of ſingular ſervice. 6. In order to augment the concoctive force of the ſtomach, which in a phthiſis is very languid, it is expedient between meals to exhibit ſome balſamic pectoral, and ſtomachic elixir, ſuch as that made of the beſt myrrh, ſaffron, nutmegs, orange-peel, marſh-trefoil, and liquorice root.

As to the pectoral and vulnerary balſams, the forms recommended by the moſt celebrated phyſicians, are, according to the ſame author, the following ones.

Take of the oil of St. John's wort, two ounces; of ſperma-ceti, ſix drachms; of the beſt Venice-turpentine, three drachms; of dragon's blood, one drachm; and of laudanum opiatum, ſix grains: mix all together, and let the doſe be from one to two drachms.

Nor, ſays he, have I found the following balſam leſs efficacious: take of the oil of ſweet almonds, two ounces: and of the flowers of ſulphur, ſublimed by quick-lime, two drachms: boil over a gentle fire; then add, of the balſam-capivi, one drachm; of ſperma-ceti and bees-wax, each half an ounce; of the extract of ſaffron, half a drachm; and of the oils of aniſe, fennel and mace, each ten drops.

Another balſam for anſwering the ſame end may be prepared thus. Take of the beſt Pruſſian honey and mountain-diacodium, each one ounce; of the aqueous eſſence of myrrh inſpiſſated, half an ounce; of the flowers of ſulphur, and the extract of the tops of yarrow, each two drachms; of the extract of ſaffron, half a drachm; and of the oils of mace and ſaſſafras-wood, each eight drops.

Theſe noble and efficacious balſams, when their uſe is indicated, cannot be exhibited in a better or more proper vehicle, than a ſufficient quantity of the milk of aſſes, goats, or cows.

In colliquative ſweats, Morton recommends the free uſe of pearl-julep; to which may be added chalk, coral, dragon's blood, or other abſorbents: the patient ſhould not be allowed to ſleep too long, and the bed-cloths ſhould be lighter.

PHYGETHLON, in ſurgery, a broad, but not much elevated tumour, of the ſame nature with the bubo. See BUBO.

PHYLACTERY, in antiquity, a charm, or amulet, which being worn, was ſuppoſed to preſerve people from certain evils, diſeaſes, and dangers.

The Jews were remarkable for wearing phylacteries of parchment, in the form of ſlips or rolls, wherein were written certain paſſages of the law: theſe they wore upon their foreheads, and upon the wriſts of their left arms. The modern Jews think themſelves under an obligation to this practice, which they obſerve only at morning prayers.

PHYSIC, φυσικη, the ſame with medicine. See MEDICINE.

PHYSICAL, ſomething relating to nature. See NATURE and NATURAL PHILOSOPHY.

PHYSICIAN, a perſon who profeſſes medicine, or the art of healing diſeaſes. See the article MEDICINE and DISEASE.

For an account of the college of phyſicians in London, ſee COLLEGE.

PHYSICS, a denomination ſometimes given to natural philoſophy. See the article NATURAL PHILOSOPHY.

PHYSIOGNOMONICS, among phyſicians, denote ſuch ſigns as being taken from the countenance, ſerve to indicate the ſtate, diſpoſition, &c. both of the body and mind: and hence the art of reducing theſe ſigns to practice is termed phyſiognomy, than which nothing can be more precarious, in ſo far as it reſpects the characters of people, accuſtomed by education and practice to diſſemble their ſentiments.

PHYSIOLOGY properly denotes a diſcourſe of nature, and natural bodies; or, it is that part of natural philoſophy which treats of the various phænomena of nature in a ſcientifical and ſpeculative way; in which ſenſe, neither chemiſtry nor experimental philoſophy are included under it.

If we take a view of the ſeveral phænomena, and compare them together, we may obſerve ſome likeneſs and conformity between them. For example, in the falling of a ſtone to the ground, in the riſing of the ſea towards the moon, in a coheſion and cryſtallization, there is ſomething alike; namely, an union or mutual approach of bodies: ſo that any one of theſe, or the like phænomena, may not ſeem ſtrange or ſurpriſing to a man who has nicely obſerved and compared the effects of nature: for that only is thought ſo which is uncommon, or a thing by itſelf, and out of the ordinary courſe of our obſervation. That bodies ſhould tend towards the center of the earth is not thought ſtrange, becauſe it is what we perceive every moment of our lives; but that they ſhould have a like gravitation towards the center of the moon, may ſeem odd and unaccountable to moſt men, becauſe it is diſcerned only in the tides; but a philoſopher, whoſe thoughts take in a larger compaſs of nature, having obſerved a certain ſimilitude of appearances, as well in the heavens as the earth, that argue innumerable bodies to have a mutual tendency towards each other, which he denotes by the general name attraction, whatever can be reduced to that he thinks juſtly accounted for; and thus he explains the tides by attraction. See ATTRACTION and TIDE.

If therefore we conſider the difference there is betwixt natural philoſophers and other men, with regard to their knowledge of the phænomena, we ſhall find it conſiſts only in a greater largeneſs of comprehenſion; whereby analogies, harmonies, and agreements are diſcovered in the works of nature, and the particular effects explained; that is, reduced to general rules, which rules, grounded on the analogy and uniformneſs obſerved in the production of natural effects, are moſt agreeable and ſought after by the mind; for that they extend our proſpect beyond what is preſent and near to us, and enable us to make very probable conjectures touching things that may have happened at very great diſtances of time and place, as well as to predict things to come; which ſort of endeavour towards omniſcience, is much affected by the mind.

Among phyſicians, the term phyſiology denotes the hiſtory of the human body and its ſeveral conſtituent parts, with their relations and functions.

PIA MATER, in anatomy, the third tunic or membrane of the brain, placed immediately under the tunica arachnoides, and cloſely and firmly connected to the brain: it not only extends over the whole ſurface of the brain, but inſinuates itſelf into all its cavities, and is carried down to the bottom of all its furrows. It covers alſo the ſpinal marrow, and all the nerves, and adheres alſo to the tunica arachnoides very cloſely and firmly, in the upper part of the head; but much leſs ſo below, with the dura mater.

PIAZZA, in building, a portico, or covered walk, ſupported by arches. See the article PORTICO.

PICA, in medicine, a depravation of appetite, which makes the patient long for what is unfit for food, or incapable of nouriſhing, as chalk, aſhes, coals, plaſter, lime, &c.

PICARDS, a ſect ſo called from their leader, one Picard, a Fleming, who, about the beginning of the fifteenth century, improved upon the error of the Adamites, in reſpect to nakedneſs; and who pretended that he was ſent into the world, as another Adam, to reſtore the law of nature, which, he ſaid, conſiſted principally of two things, a community of women, and a nakedneſs of all the parts of the body.

PICAGE, or PICCAGE, an ancient cuſtom or duty paid at fairs and markets, for breaking the ground, and pitching up ſtalls or ſtandings.

PICKLE, a brine or liquor, commonly compoſed of ſalt, vinegar, &c. ſometimes with the addition of ſpices, wherein meat, fruit, and other things are preſerved and ſeaſoned. The ſame name is alſo given to any vegetable production prepared in pickle.

PIQUEERING, PICKEERING, or PICKEROONING, a flying war or ſkirmiſh made by ſoldiers detached from two armies for pillage, or before a main battle begins.

PICTURE, a piece of painting, or a ſubject repreſented in colours, on wood, canvas, paper, or the like. See PAINTING.

PIECE, in commerce, ſignifies ſometimes a whole, and ſometimes a part of the whole. In the firſt ſenſe, we ſay a piece of cloth or velvet, &c. meaning a certain quantity of yards regulated by cuſtom; being yet entire, and not cut. In the other ſignification, we ſay a piece of tapeſtry, meaning a diſtinct member wrought a-part, which, with ſeveral others, make one hanging.

PIECE, in matters of money, ſignifies ſometimes the ſame thing with ſpecies; and ſometimes by adding the value of the pieces, it is uſed to expreſs ſuch as have no other particular name.

PIECE, in heraldry, denotes an ordinary or charge.

PIECES, in the military art, includes all ſorts of great guns and mortars. Battering pieces are the larger ſort of guns uſed at ſieges for making the breaches; ſuch are the twenty-four pounders, and culverine, the one carrying twenty-four, and the other an eighteen pound ball. Field-pieces are twelve-pounders, demi-culverines, ſix-pounders, ſakers, minions, and three-pounders, which march with the army, and encamp always behind the ſecond line, but in day of battle are in the front. A ſoldier's firelock is likewiſe called his piece.

PIEDOUCHE, in architecture, a pier or ſquare kind of pillar, part of which is hid within a wall. The only thing wherein it differs from a pilaſter is, that the latter has a regular baſe and capital, which the other wants. See PILASTER.

This term is alſo uſed for part of the ſolid wall annexed to a door or window, comprehending the door-poſt, chambranle, tableau, leaf, &c.

PIEPOWDER COURT, or PEDES PULVERISATI, a court held in fairs for doing juſtice to buyers and ſellers, and redreſſing diſorders there committed.

It is ſo called, as being moſt uſually held in the ſummer, when the ſuitors to the court have duſty feet, &c. This is a court of record, incident to every fair, and is to be held only during the time the fair is kept.

PIER, or PEER, in building, denotes a maſs of ſtone, &c. oppoſed by way of fortreſs againſt the force of the ſea, or a great river, for the ſecurity of ſhips that lie at harbour in any haven.

It is alſo uſed in architecture for a kind of pilaſter, or buttreſs, raiſed for ſupport, ſtrength, and ſometimes for ornament.

PIERCED, PERCE', in heraldry, is when any ordinary is perforated, or ſtruck through, ſhewing, as it were, a hole in it, which muſt be expreſſed in blazon, as to its ſhape: thus if a croſs have a ſquare hole, or perforation in the center, it is blazoned ſquare-pierced, which is more proper than quarterly-pierced, as Leigh expreſſes it. When the hole or perforation is round, it muſt be expreſſed round-pierced; if it be in the ſhape of a lozenge, it is expreſſed pierced lozenge-ways. All piercings muſt be of the colour of the field, and when ſuch figures appear on the centre of a croſs, &c. of another colour, the croſs is not to be ſuppoſed pierced, but that the figure on it is a charge, and muſt be accordingly blazoned.

PIERCING, among farriers. To pierce a horſe-ſhoe lean, is to pierce it too near the edge of the iron: to pierce it fat, is to pierce it farther in.

PIETISTS, a religious ſect ſprung up among the proteſtants of Germany, ſeeming to be a kind of mean between the Quakers of England, and the Quietiſts of the Romiſh church.

They deſpiſe all ſorts of eccleſiaſtical polity, all ſchool theology, and all forms and ceremonies, and give themſelves up to contemplation and the myſtic theology.

PIG, in zoology, the young of the hog kind. See HOG.

PIGEON, in ornithology. See COLUMBA.

There are two kinds of pigeons, the wild and the tame; the latter differ from the former only in bigneſs and familiarity: the wild uſually perch upon trees, being ſeldom ſeen on the ground. Pigeons are of various ſorts, ſuch as carriers, powters, runts, turbets, &c. See CARRIERS, &c.

There are two ſeaſons when you may eaſily procure a ſufficient ſtock of pigeons, viz. May and Auguſt: for at theſe ſeaſons there are a great number of young pigeons, which may then be purchaſed very reaſonably.

PIGEON HOUSE, a houſe erected full of holes within for the keeping, breeding, &c. of pigeons, otherwiſe called a dove cote.

Any lord of a manor may build a pigeon-houſe on his land, but a tenant cannot do it without the lord's licence. When perſons ſhoot at or kill pigeons within a certain diſtance of the pigeon-houſe, they are liable to pay a forfeiture.

In order to erect a pigeon-houſe to advantage, it will be neceſſary, in the firſt place, to pitch upon a convenient ſituation, of which none is more proper than the middle of a ſpacious court-yard, becauſe pigeons are naturally of a timorous diſpoſition, and the leaſt noiſe they hear frightens them. With regard to the ſize of the pigeon-houſe, it muſt depend entirely upon the number of birds intended to be kept; but it is better to have it too large than too little; and as to its form, the round ſhould be preferred to the ſquare ones; becauſe rats cannot ſo eaſily come at them in the former as in the latter. It is alſo much more commodious; becauſe you may, by means of a ladder turning upon an axis, eaſily viſit all the neſts in the houſe, without the leaſt difficulty; which cannot ſo eaſily be done in a ſquare-houſe.

In order to hinder rats from climbing up the outſide of the pigeon-houſe, the walls ſhould be covered with tin plates to a certain height, about a foot and a half will be ſufficient; but they ſhould project out three or four inches at the top, to prevent their clambering any higher.

The pigeon-houſe ſhould be placed at no great diſtance from water, that the pigeons may carry it to their young ones; and their carrying it in their bills will warm it, and render it more wholeſome in cold weather.

The boards that cover the pigeon-houſe ſhould be well joined together, ſo that no rain may penetrate through it. And the whole building ſhould be covered with hard plaſter, and white-waſhed within and without, white being the moſt pleaſing colour to pigeons. There muſt be no window, or other opening, in the pigeon-houſe to the eaſtward; theſe ſhould always face the ſouth, for pigeons are very fond of the ſun, eſpecially in winter.

The neſts or covers in a pigeon houſe, ſhould conſiſt of ſquare holes made in the walls, of a ſize ſufficient to admit the cock and hen to ſtand in them. The firſt range of theſe neſts ſhould not be leſs than four feet from the ground, that the wall underneath being ſmooth, the rats may not be able to reach them. Theſe neſts ſhould be placed in quincunx order, and not directly over one another. Nor muſt they be continued any higher than within three feet of the top of the wall: and the upper row ſhould be covered with a board projecting a conſiderable diſtance from the wall, for fear the rats ſhould find means to climb the outſide of the houſe.

This deſcription of a pigeon-houſe will be more eaſily underſtood, from the figure we have given of it on plate C. The upper compartment of which repreſents a farmer's yard, where I is the farm-houſe. P, the paſſage from the yard. Q, the cellar and ſtore-houſe. R, entrance to the preſs. H, the cyder preſs. G, plan of an outhouſe for holding apples, &c. adjoining to the preſs. F, dairy. E, paſſage into the yard. D, C, cow-houſes. B, L, M, ſtables. A, the pigeon-houſe. K, the horſe-pond. T, the barn. N, the great door of the barn. O, cart-houſe, &c.

The lower compartment.

Fig. 1. A trough for feeding a great number of calves, lambs, &c. A B, the trough. C D F F, ſtaves for ſeparating the trough, that the lambs may feed without diſturbing one another. C D, F F, tranſverſe pieces, to keep the upper part of the ſtaves at a proper diſtance from ea h other.

Fig. 2. A treſſel for ſupporting the trough. K, the treſſel on which the bottom of the trough reſts. G, H, pieces of wood mortiſed into the treſſel, in an oblique poſition, for keeping the trough ſteady.

Fig. 3. Part of the ſtable wall, into which the piece of wood L is faſtened. Into this another, M N, is mortiſed for ſupporting the rack *a b*, for holding the hay, &c. for the horſes, &c.

Fig. 4. A vertical ſection of the pigeon-houſe, in order to ſhew the inſide of it. H, K, arches ſupporting the pigeon-houſe. A B, axis of the turning-ladders L L, M M. C, D, are openings by which the pigeons paſs out and into the pigeon-houſe. The neſts or holes are ranged in quincunx order. E, the upper boundary of the neſts, projecting over the holes, in order to prevent the rats or other vermin from getting down to deſtroy the pigeons. F, G, the cinctures, or places where the ſtones project on the outſide, in order to prevent any vermin from climbing up the outſide of the houſe.

Fig. 5. an elevation of three rows of holes, and a plan of one of the three ranks, drawn on a larger ſcale.

PIKE, an offenſive weapon, conſiſting of a ſhaft of wood, twelve or fourteen feet long, headed with a flat-pointed ſteel, called the ſpear. The pike was a long time in uſe among the infantry, to enable them to ſuſtain the attack of the cavalry, but it is now taken from them, and the bayonet, which fixes on at the end of the carabine, is ſubſtituted in its place: yet the pike ſtill continues the weapon of foot-officers, who fight pike in hand, ſalute with the pike, &c.

PIKE, in ichthyology, the ſame with lucius. See the article LUCIUS.

PILASTER, in architecture, a ſquare column, ſometimes inſulated, but more frequently let within a wall, and only ſhewing a fourth or fifth part of its thickneſs.

The pilaſter is different in different orders; it borrows the name of each, and has the ſame proportions, and the ſame capitals, members, and ornaments, with the columns themſelves. Pilaſters are however uſually made without either ſwelling or diminution, and as broad at top as at the bottom; though ſome of the modern architects, as M. Manſard, &c. diminiſh them at the top, and even make them ſwell in the middle, like columns, particularly when placed behind columns.

Mr. Perrault obſerves, that pilaſters, like columns, become of different kinds, according to the different manner in which they are applied to the wall. Some are wholly detached, and theſe Vitruvius calls paraſtatæ; others have three faces clear out of the wall; others two; and others only one; theſe Vitruvius calls antæ. Inſulate pilaſters are but rarely found in the antique; for the chief uſe the ancients made of them, was to give the greater ſtrength to the extremities of porticoes.

There are four things to be principally regarded in pilaſters; their projecture out of the wall; their diminution; the diſpoſition of the entablature, when it happens to be common to them and to a column; and their flutings and capitals. 1. then, The projecture of pilaſters that have only one face out of the wall, ought to be one eighth of their breadth, or at moſt one ſixth; but when they receive impoſts againſt their ſides, the projecture may be a quarter of their diameter. 2. Pilaſters are ſeldom diminiſhed when they have only one face out of the wall: indeed when they ſtand in the ſame line with columns, and the entablature is continued over both, without any break, the pilaſters are to have the ſame dimenſions with the columns. 3. Pilaſters are ſometimes fluted, though the columns that accompany them are not ſo; and on the contrary, the columns are ſometimes fluted, when the pilaſters that accompany them are not. The flutings of pilaſters are always odd in number, except in half pilaſters, which meet at inward angles, where four flutings are made for three, &c. 4. The proportions of the capitals

of

of pilaſters, are the ſame as to height with thoſe of columns; but they differ in breadth, the leaves of pilaſters being much broader; becauſe pilaſters, though of equal extent, have only the ſame number of leaves for their girt, viz. eight. Their uſual diſpoſition is to have two in each face in the lower row, one in the middle, and two halves in the angles, in the turns of which they meet. Add to this, that the rim of the vaſe, or tambour, is not ſtrait, as the lower part is; but a little circular and prominent in the middle. See FLUTINGS.

In pilaſters that ſupport arches, the proportions, according to Palladio, ſhould be regulated by the light they are placed in; and at the angles by the weight they are to ſuſtain: they muſt not be too tall and ſlender, leſt they reſemble pillars, nor too dwarfiſh and groſs, leſt they appear like the piers of bridges. In private buildings they ought not to be narrower than one third, nor broader than two thirds of the vacuity, or interſpace between pilaſter and pilaſter; but as for thoſe that ſtand at the corners, they may have a little more latitude allowed them, to give the greater ſtrength to the angles. Palladio obſerves, that in the theatres and amphitheatres, and ſuch maſſive works, they have been as broad as the half, and ſometimes as the whole vacuity or interſpace. He alſo aſſerts, that their true proportion ſhould be an exact ſquare; but for leſſening of expence, they are uſually made narrower in flank than in front.

PILCHARD, *Pilchardus*, in ichthyology, a ſpecies of clupea, with the upper jaw bifid, and ſpotted on each ſide with black.

PILE, in antiquity, a pyramid built of wood, on which the bodies of the deceaſed were laid in order to be burnt.

PILE, in building, is uſed for a large ſtake rammed into the ground in the bottom of rivers, or in marſhy land, for a foundation to build upon.

PILE is alſo uſed among architects for a maſs of building.

PILE, in coinage, denotes a kind of puncheon, which in the old way of coining with the hammer, contained the arms, or other figure and inſcription to be ſtruck on the coin.

PILE, in heraldry, an ordinary in form of a wedge, contracting from the chief, and terminating in a point towards the bottom of the ſhield.

PILES, in medicine, the ſame with hæmorrhoids. See HÆMORRHOIDS.

PILGRIMAGE, a kind of religious diſcipline, which conſiſts in taking a journey to ſome holy place, in order to adore the relics of ſome deceaſed ſaint. Pilgrimages began to be made about the middle ages of the church; but they were moſt in vogue after the end of the eleventh century, when every one was for viſiting places of devotion, not excepting kings and princes themſelves; and even biſhops made no difficulty of being abſent from their churches on the ſame account. The places moſt viſited were Jeruſalem, Rome, Compoſtella, and Tours; but the greateſt numbers now reſort to Loretto, in order to viſit the chamber of the bleſſed Virgin, in which ſhe was born, and brought up her ſon Jeſus, till he was twelve years of age. This chamber, it is pretended, was carried by angels into Dalmatia, about the year 1291, and afterwards in the ſame manner tranſported to Loretto, where a magnificent cathedral is built over it. In this chamber, is the image of the bleſſed Virgin, almoſt covered with pearls and diamonds, and round the ſtatue is a kind of rainbow formed of precious ſtones of various colours. Five hundred thouſand pilgrims ſometimes reſort to this houſe in one year, in order to pay their devotions before this glorious image.

PILL, in pharmacy, a form of medicine reſembling a little ball, to be ſwallowed whole, invented in favour of ſuch as cannot take bitter and ill-taſted medicinal draughts, as alſo to keep in readineſs for occaſional uſe without decaying.

PILLAGE, among builders, is a ſquare pillar, ſtanding behind a column to bear up arches.

PILLAR, in architecture, a kind of irregular column, round and inſulated, but deviating from the proportions of a juſt column.

Pillars are always either too maſſive, or too ſlender for regular architecture; ſuch are the pillars which ſupport Gothic vaults, or buildings; and, indeed, they are not reſtrained by any rules, their parts and proportions being arbitrary.

Butting PILLAR, the ſame with buttreſs. See the article BUTTRESS.

Square PILLAR, a maſſive work, called alſo a pier, or piedroit, ſerving to ſupport arches, &c.

PILLORY was anciently a poſt erected in a croſs-road, by the lord of the manor, with his arms upon it, as a mark of his ſeigniory, and ſometimes with a collar to fix criminals to. At preſent, it is a wooden machine, made to confine the head and hands, in order to expoſe criminals to public view, and to render them publicly infamous.

PILOT, a perſon employed to conduct ſhips over bars and ſands, or through intricate channels, into a road or harbour.

PIMENTA, or PIMENTO, in the materia medica, Jamaica pepper, or all-ſpice, the dried aromatic berry of a large tree growing in the mountainous parts of Jamaica, reckoned a ſpecies of myrtle, and called by Sir Hans Sloane, *myrtus arborea aromatica foliis laurinis*; by Linnæus, *myrtus foliis alternis*.

Pimenta is a moderately warm ſpice, of an agreeable flavour, ſomewhat reſembling that of a mixture of cloves, cinnamon, and nutmegs. Diſtilled with water it yields an elegant eſſential oil, ſo ponderous as to ſink in the aqueous fluid, in taſte moderately pungent, in ſmell and flavour approaching to oil of cloves, or rather a mixture of thoſe of cloves and nutmegs: the remaining decoction inſpiſſated, leaves an extract ſomewhat ungrateful, but not pungent, and the berry itſelf is found to be almoſt wholly deprived of its taſte as well as flavour; the warmth of this ſpice reſiding rather in the volatile than in the fixed parts.

This ſpice, at firſt brought over for dietetic uſes, has been long employed in the ſhops as a ſuccedaneum to the more coſtly oriental aromatics; from them it was introduced into our hoſpitals, and is now received both in the London and Edinburgh Pharmacopæias. The college of London directs a ſimple water to be diſtilled from it, in the proportion of a gallon from half a pound: this is ſtrongly impregnated with the flavour of the pimenta, though it is leſs elegant than the ſpirituous water which the ſhops have been accuſtomed to prepare, by drawing off two or three gallons of proof ſpirit from the ſame quantity of the ſpice. The eſſential oil does not ſeem to be much known in practice; though it promiſes to be a very uſeful one, and might, doubtleſs, on many occaſions, ſupply the place of many of the dearer oils. The quantity of oil afforded by the ſpice is very conſiderable: Cartheuſer indeed ſays, that only about half a dram is to be got from ſixteen ounces; a miſtake, which probably has ariſen from inadvertence in copying Neumann's proportion, of half a dram from an ounce, or one ſixteenth: ſo large a proportion as this laſt cannot, however, be collected in its proper form, the oil that remains diſſolved in the diſtilled water being here included.

PIMPLE, in ſurgery, a ſmall puſtule, ariſing chiefly on the face. See the article PUSTULE.

PIN, in commerce, a little neceſſary implement made of braſs wire, uſed chiefly by the women in adjuſting their dreſs.

The perfection of pins conſiſts in the ſtiffneſs of the wire and its whiteneſs, in the heads being well turned, and in the fineneſs of the points. The London pointing and whitening are in moſt repute, becauſe our pin-makers, in pointing, uſe two ſteel-mills, the firſt of which forms the point, and the latter takes off all irregularities, and renders it ſmooth, and as it were poliſhed; and in whitening, they uſe block-tin granulated: whereas in other countries they are ſaid to uſe a mixture of tin, lead, and quick-ſilver; which not only whitens worſe than the former, but is alſo dangerous, on account of the ill quality of that mixture, which renders a puncture with a pin thus whitened, ſomewhat difficult to be cured. The conſumption of pins is incredible, and there is no commodity ſold cheaper. The number of hands employed in this manufacture is very great, each pin paſſing through the hands of ſix different workmen,

between the drawing of the braſs wire, and the ſticking of the pin in the paper.

Pins are ſometimes made of iron-wire, rendered black by a varniſh of linſeed-oil, with lamp-black, which the braſs-wire would not receive: theſe are deſigned for the uſe of perſons in mourning, though not univerſally approved of.

PINCHING, in gardening, a kind of pruning, performed by nipping off the young and tender ſprigs of trees and plants between the nails of the thumb and finger, chiefly practiſed in April or May, and ſometimes in June and July, on the large uſeleſs branches towards the top of a plant or tree, becauſe they conſume a great deal of the ſap. See PRUNING.

PINDARIC, in poetry, an ode formed in imitation of the manner of Pindar. The Pindaric manner is diſtinguiſhed by the boldneſs and height of the flights; the ſuddenneſs and ſurpriſingneſs of the tranſitions; and the ſeeming irregularity, wildneſs, and enthuſiaſm of the whole. The only part remaining of Pindar's works is a book of odes, all in praiſe of the victors at the Olympian, Pythian, Nemæan, and Iſthmian, games; whence the firſt is intitled the Olympians, the ſecond the Pythians, the third the Nemæans, and the fourth the Iſthmians.

PINE, *Pinus*, in botany, a genus of trees, the male flowers of which are collected in a ſcaly conical bunch, having many ſtamina, which are connected at their baſe, terminated by erect ſummits, included in the ſcales, which ſupply the want of petals and empalement. The female flowers are collected in a common oval cone, and ſtand at a diſtance from the male on the ſame tree. Under each ſcale of the cone is produced two flowers, which have no petals, but a ſmall germen, ſupporting an awl-ſhaped ſtyle, crowned by a ſingle ſtigma. The germen afterward becomes an oblong oval nut, crowned with a wing, included in the rigid ſcale of the cone.

There are various ſpecies of the pine-tree; but two only that deſerve cultivating; namely, the Scotch-pine, and the white pine, commonly called in England lord Weymouth's, or New-England pine.

The Scotch-pine, ſo called from its growing naturally on the mountains of Scotland, is the tree that affords the red or yellow deal, which is the moſt durable of any of the kinds yet known. The leaves of this tree are pretty broad and ſhort, of a greyiſh colour, growing two out of each ſheath; the cones are ſmall, pyramidal, and end in narrow points; they are of a light colour, and the ſeeds are ſmall.

This ſort grows well upon almoſt every ſoil; I have planted numbers of the trees upon peat bogs, where they have made great progreſs. I have alſo planted them in clay, where they have ſucceeded far beyond expectation; and upon ſand, gravel, and chalk, they likewiſe thrive as well; but as they do not grow near ſo faſt upon gravel and ſand, as upon moiſt ground, ſo the wood is much preferable; for thoſe trees which have been cut down upon moiſt ſoils, where they have made the greateſt progreſs, when they have been ſawn out into boards, have not been valuable, the wood has been white, and of a looſe texture; whereas thoſe which have grown upon dry gravelly ground, have proved nearly equal to the beſt foreign deals; and I doubt not but thoſe plantations, which of late years have been made of theſe trees, will, in the next age, not only turn greatly to the advantage of their poſſeſſors, but alſo become a national benefit.

The white pine is one of the talleſt trees of all the ſpecies, often growing a hundred feet high, as I have been credibly informed. The bark of this tree is very ſmooth and delicate, eſpecially when young; the leaves are long and ſlender, five growing out of each ſheath; the branches are pretty cloſely garniſhed with them, ſo make a fine appearance; the cones are long, ſlender, and very looſe, opening with the firſt warmth of the ſpring; ſo that if they are not gathered in winter, the ſcales open and let out the ſeeds. The wood of this ſort is eſteemed for making of maſts for ſhips; it is in England called lord Weymouth's, or New-England pine, as hath been already obſerved. As the wood of this tree was generally thought of great ſervice to the navy, there was a law made in the ninth year of queen Anne, for the preſervation of the trees, and to encourage their growth in America; and it is within forty years paſt theſe trees began to be propagated in England in any plenty, though there were ſome large trees of this ſort growing in two or three places long before, particularly at lord Weymouth's at Longleet, ſir Wyndham Knatchbull's in Kent; and it has been chiefly from the ſeeds of the latter that the much greater number of theſe trees now in England have been raiſed; for although there has annually been ſome of the ſeeds brought from America, yet thoſe have been few in compariſon to the produce of the trees in Kent: many of the trees, which have been raiſed from the ſeeds of thoſe trees, now produce plenty of good ſeeds, particularly thoſe in the gardens of the late duke of Argyle at Whitton, which annually produce large quantities of cones, which his grace, when living, moſt generouſly diſtributed to all the curious.

All the ſorts of pines are propagated by ſeeds, which are produced in hard woody cones; the way to get the ſeeds out of theſe cones, which are cloſe, is to lay them before a gentle fire, which will cauſe the cells to open, and then the ſeeds may be eaſily taken out. If the cones are kept entire, the ſeeds will remain good ſome years, ſo that the ſureſt way to preſerve them, is to let them remain in the cones, until the time for ſowing the ſeeds: if the cones are kept in a warm place in ſummer, they will open, and emit the ſeeds, but if they are not expoſed to much heat, many of the ſorts will remain entire ſome years, eſpecially thoſe which are cloſe and compact; and the ſeeds, which have been taken out of cones of ſeven years old, have grown very well, ſo that theſe may be tranſported to any diſtance, provided the cones are well ripened, and properly put up.

The beſt time for ſowing the ſeeds of pines, is about the end of March; when the ſeeds are ſown, the place ſhould be covered with nets to keep off birds, otherwiſe, when the plants begin to appear with the huſk of the ſeed on their tops, the birds will pick off the heads of the plants, and deſtroy them.

Where the quantity of ſeeds to be ſown is not great, it will be a good way to ſow them either in boxes or pots filled with light loamy earth, which may be removed from one ſituation to another, according to the ſeaſon of the year; but if there is a large quantity of the ſeeds, ſo as to require a good ſpace to receive them, they ſhould be ſown on an eaſt or north-eaſt border, where they may be ſcreened from the ſun, whoſe heat is very injurious to theſe plants at their firſt appearance above ground. Thoſe ſeeds, which are ſown in pots or boxes, ſhould alſo be placed in a ſhady ſituation, but not under trees; and if they are ſcreened from the ſun with mats, at the time when the plants firſt come up, it will be a good method to preſerve them.

When the plants appear, they muſt be conſtantly kept clean from weeds, and, in very dry ſeaſons, if they are now and then gently refreſhed with water, it will forward their growth; but this muſt be done with great care and caution, for if they are haſtily watered, it will waſh the tender plants out of the ground, or lay them down flat, which often rots their ſhanks; and when this is too often repeated, it will have the ſame effect; ſo that unleſs it is judiciouſly performed, it will be the beſt way to give them none, but only ſcreen them from the ſun.

If the plants come up too cloſe, it will be a good method to thin them gently about the beginning of July. The plants, which are drawn up, may then be planted on other beds, which ſhould be prepared ready to receive them, for they ſhould be immediately planted as they are drawn up, becauſe their tender roots are ſoon dried and ſpoiled at this ſeaſon of the year. This work ſhould be done, if poſſible, in cloudy or rainy weather, and then the plants will draw out with better roots, and will ſoon put out new fibres again; but if the weather ſhould prove clear and dry, the plants ſhould be ſhaded every day from the ſun with mats, and now and then gently refreſhed with water. In drawing up of the plants, there ſhould be great care taken not to diſturb the roots of the plants left remaining in the ſeed-beds, &c. ſo that if the ground be hard, the beds ſhould be well watered ſome time before the plants are thinned, to ſoften and looſen the earth; and if, after the plants are drawn out, the beds are again

PLATE C.

Facing Pigeon-house.

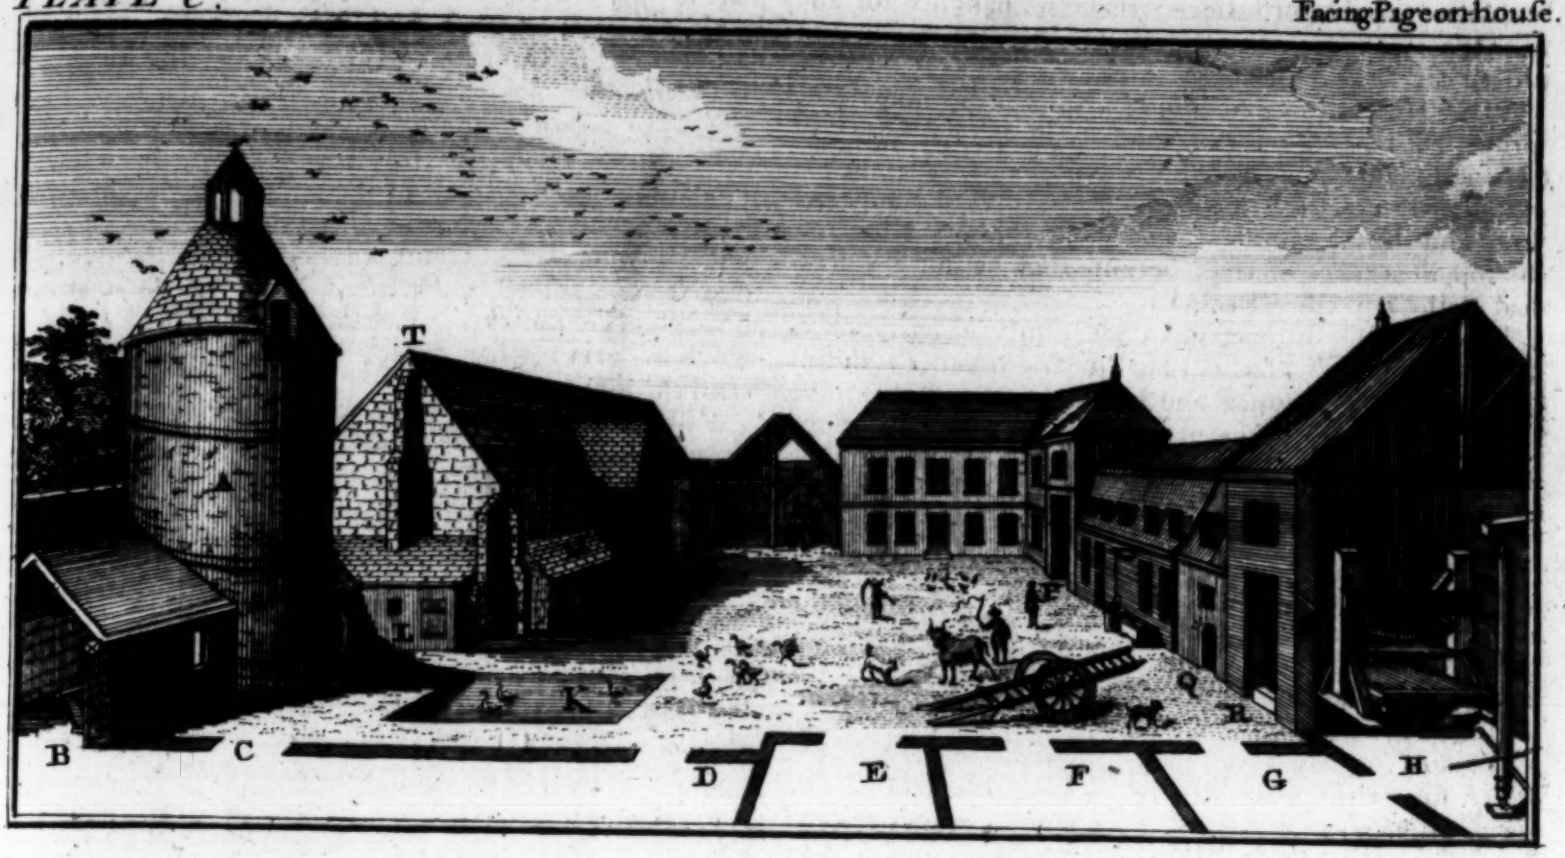

Fig. 4.

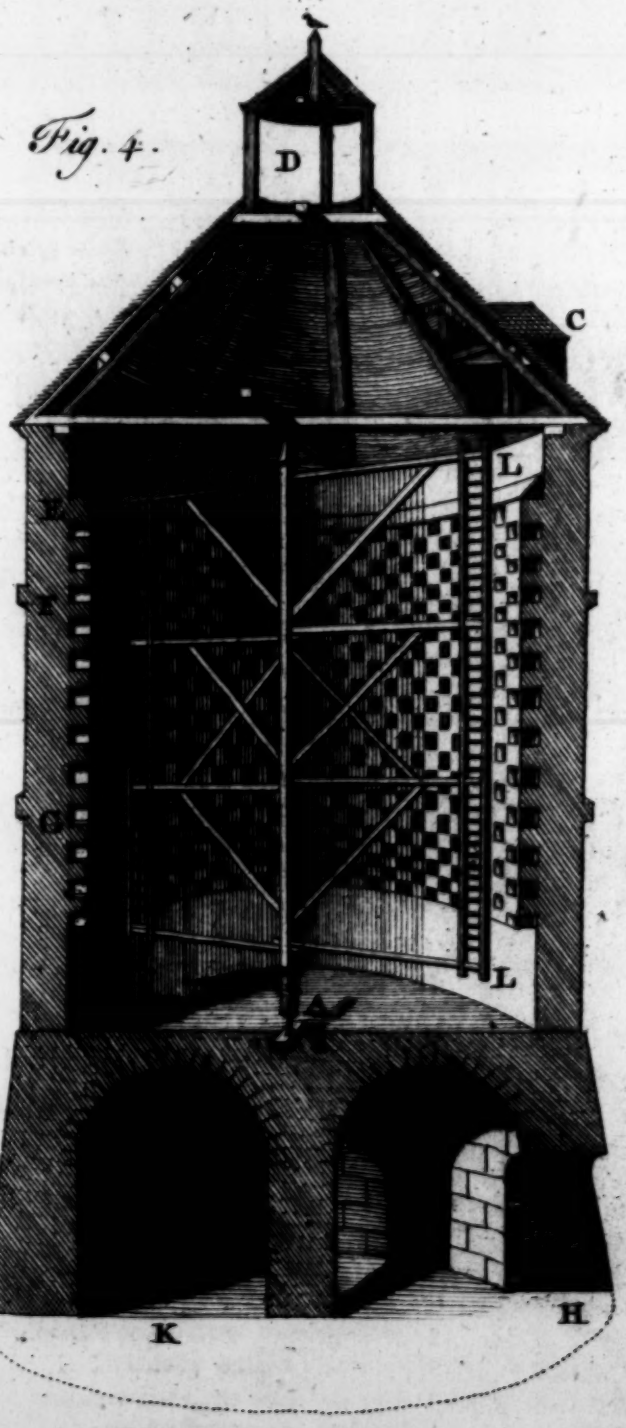

Fig. 1.

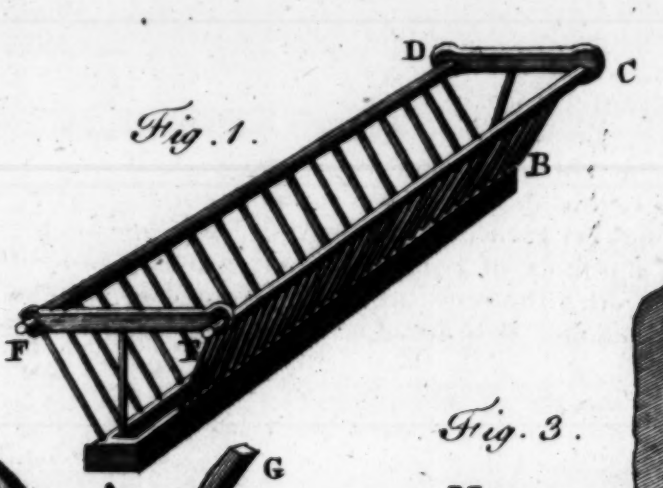

Fig. 2.

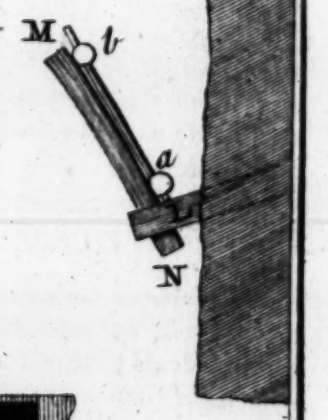
Fig. 3.



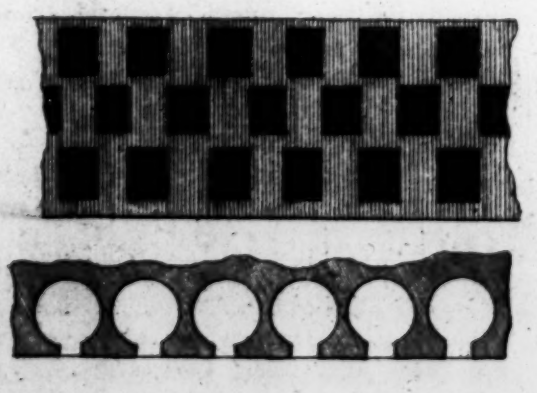


Fig. 5.

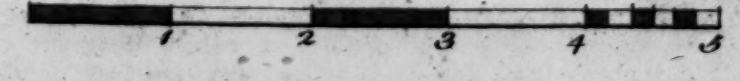

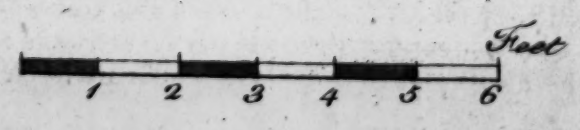

5 JA 59

gently watered to ſettle the earth to the roots of the remaining plants, it will be of great ſervice to them; but it muſt be done with great care, ſo as not to waſh out their roots, or lay down the plants. The diſtance, which ſhould be allowed theſe plants, is four or five inches row from row, and three inches in the rows.

In theſe beds the plants may remain till the ſpring twelvemonths after, by which time they will be fit to tranſplant where they are to remain for good; for the younger plants are, when planted out, the better they will ſucceed; for although ſome ſorts will bear tranſplanting at a much greater age, yet young plants planted at the ſame time will in a few years overtake the large ones, and ſoon outſtrip them in their growth; and there is an advantage in planting young, by ſaving the expence of ſtaking, and much watering, which large plants require. I have ſeveral times ſeen plantations of ſeveral ſorts of pines, which were made of plants ſix or ſeven feet high, and at the ſame time others of one foot high planted between them, which in ten years were better trees than the old ones, and much more vigorous in their growth; but if the ground, where they are deſigned to remain, cannot be prepared by the time before-mentioned, the plants ſhould be planted out of the beds into a nurſery, where they may remain two years, but not longer; for it will be very hazardous in removing theſe trees at a greater age.

The beſt ſeaſon to tranſplant theſe pines, is about the latter end of March, or the beginning of April, juſt before they begin to ſhoot; for although the Scotch pine, and ſome of the moſt hardy ſorts, may be tranſplanted in winter, eſpecially when they are growing in ſtrong land, where they may be taken up with balls of earth to their roots, yet this is what I would not adviſe for common practice, having frequently ſeen it attended with bad conſequences, but thoſe which are removed in the ſpring rarely fail.

Where theſe trees are planted in expoſed ſituations, they ſhould be put pretty cloſe together, that they may ſhelter each other, and, when they have grown a few years, part of the plants may be cut down to give room for the others to grow; but this muſt be gradually performed, leſt by too much opening the plantation at once, the air ſhould be let in among the remaining trees with too great violence, which will ſtop their growth.

Wherever large plantations are deſigned to be made, the beſt method will be to raiſe the plants either upon a part of the ſame land, or as near to the place as poſſible, and alſo upon the ſame ſort of ſoil; a ſmall piece of ground will be ſufficient to raiſe plants enough for many acres; but, as the plants require ſome care in their firſt raiſing, if the neighbouring cottagers, who have many of them ſmall incloſures adjoining to their cottages; or, where this is wanting, a ſmall incloſure ſhould be made them for the purpoſe of raiſing the plants, and they be furniſhed with the ſeeds and directions for ſowing them, and managing the young plants, till they are fit for tranſplanting, the women and children may be uſefully employed in this work, and the proprietors of land agreeing with them to take their plants, when raiſed, at a certain price, it would be a great benefit to the poor, and hereby they would be engaged to have a regard for the plantations when made, and prevent their being deſtroyed.

The Scotch pine, as was before obſerved, being the hardieſt of all the kinds, and the wood of it the moſt uſeful, is the ſort which beſt deſerves care. This will thrive upon the moſt barren ſands, where ſcarce any thing elſe except heath and furze will grow; ſo that there are many thouſand acres of ſuch land lying convenient for water carriage, which at preſent is of little benefit to any body, that might, by plantations of theſe trees, become good eſtates to their proprietors, and alſo a national benefit; and as the legiſlators have taken this into their conſideration, and already paſſed ſome laws for the encouraging theſe plantations, as alſo for their preſervation and ſecurity; ſo it may be hoped that this will be undertaken by the gentlemen who are poſſeſſed of ſuch lands in all the different parts of the kingdom, with proper ſpirit; for although they may not expect to receive much profit from theſe plantations in their own time, yet their ſucceſſors may with large intereſt, and the pleaſure which theſe growing trees will afford them, by beautifying the preſent dreary parts of the country, will in ſome meaſure recompenſe them for their trouble and expence, and by creating employment for the poor, leſſen thoſe rates which are now, in many parts of England, ſcarce to be borne.

The expence of making theſe plantations is what moſt people are afraid of, ſo would not engage in it; but the greateſt of the expence is that of fencing them from the cattle, &c. for the other is trifling, as there will be no neceſſity for preparing the ground to receive the plants, and the charge of planting an acre of land with theſe plants, will not be more than thirty ſhillings where labour is dear, excluſive of the plants, which may be valued at forty ſhillings more. I have planted many acres of land with theſe trees, which was covered with heath and furze, and have only dug holes between to put in the plants, and afterward laid the heath or furze, which was cut, upon the ſurface of the ground about their roots, to prevent the ground drying, and few of the plants have failed. Theſe plants were moſt of them four years old from ſeed, nor was there any care taken to clean the ground afterward, but the whole left to ſhift, and in five or ſix years the pines have grown ſo well, as to over-power the heath and furze, and deſtroy it.

The diſtance which I have generally planted theſe plants in all large open ſituations, was about four feet, but always irregular, avoiding planting in rows as much as poſſible; and in the planting, the great care is not to take up the plants faſter than they can be planted, ſo that ſome men have been employed in digging up of the plants, while others were planting. Thoſe who take up the plants, muſt be looked after to ſee they do not tear off their roots, or wound their bark; and as faſt as they are taken up, their roots ſhould be covered to prevent their drying, and put into their new quarters as ſoon as poſſible. In planting them, care ſhould be had to make the holes large enough for their roots, as alſo to looſen and break the clods of earth, and put the fineſt immediately about their roots, then to ſettle the earth gently with the foot to the roots of the plant. If theſe things are duly obſerved, and a proper ſeaſon choſen for performing it, there will be very little hazard of their ſucceeding; but I have ſeen ſome plantations made with plants, which were brought from a great diſtance, and had been ſo cloſely packed up, as to cauſe a heat, whereby moſt of the plants within had their leaves changed yellow, and few of them have grown, which has diſcouraged others from planting, not knowing the true cauſe of their failure.

After the plantations are made, the only care they require for five or ſix years, will be to ſecure the plants from cattle, hares, and rabbits; for if theſe are admitted to them, they will make great deſtruction in a ſhort time, for if the branches are gnawed by hares or rabbits, it will greatly retard the growth of the plants, if not deſtroy them.

In about five or ſix years after planting, the branches of the young trees will have met, and begin to interfere with each other, therefore they will require a little pruning; but this muſt be done with great caution. The lower tier of branches only ſhould be cut off; this ſhould be performed in September, at which time there will be no danger of the wounds bleeding too much, and the turpentine will harden over the wounds as the ſeaſon grows cold, ſo will prevent the wet from penetrating of them. Theſe branches ſhould be cut off cloſe to the ſtem of the plants, and care ſhould be taken in the doing of this, not to break any of the remaining branches of the young trees. This work ſhould be repeated every other year, at each time taking off only the lower tier of branches; for if the plants are much trimmed, it will greatly retard their growth, as it does in general that of all trees; but as theſe trees never put out any new ſhoots where they are pruned, ſo they ſuffer more from amputation than thoſe which do.

In about twelve or fourteen years theſe will require no more pruning, for their upper branches will kill thoſe below where they have not air; but ſoon after this, if the plants have made good progreſs, it may be neceſſary to

thin them; but this ſhould be gradually performed, beginning in the middle of the plantation firſt, leaving the outſide cloſe to ſcreen thoſe within from the cold, ſo by degrees coming to them at laſt, whereby thoſe, which were firſt thinned, will have had time to get ſtrength, ſo will not be in danger of ſuffering from the admiſſion of cold air. When theſe plantations are thinned, the trees ſhould not be dug up; but their ſtems cut off cloſe to the ground, for their roots never ſhoot again, but decay in the earth, ſo there can no harm ariſe by leaving them, and hereby the roots of the remaining plants are not injured. The trees which are now cut, will be fit for many purpoſes; thoſe which are ſtraight, will make good putlocks for the brick-layers, and ſerve for ſcaffolding poles, ſo that there may be as much made by the ſale of theſe, as will defray the whole expence of the planting, and probably intereſt for the money into the bargain.

As the upright growth of theſe trees renders their wood the more valuable, they ſhould be left pretty cloſe together, whereby they will draw each other up, and grow very tall. I have ſeen ſome of theſe trees growing, whoſe naked ſtems have been more than ſeventy feet high, and as ſtraight as a walking cane, and from one of theſe trees there were as many boards ſawed, as laid the floor of a room near twenty feet ſquare. If theſe trees are left eight feet aſunder each way, it will be ſufficient room for their growth; therefore, if at the firſt thinning a fourth part of the trees are taken away, the other may ſtand twelve or fourteen years longer, by which time they will be of a ſize for making ladders, and ſtandards for ſcaffolding, and many other purpoſes; ſo that from this ſale, as much may be made, as to not only pay the remaining part of the expence of planting, if any ſhould be wanting in the firſt, but rent for the land with intereſt, and the ſtanding trees for fortunes of younger children. This may be demonſtrated by figures, and there has been ſeveral examples of late years, where the profits have greatly exceeded what is here mentioned. *Miller's Gard. Dict.*

Pitch, tar, reſin, and turpentine, are all made from theſe trees by a very familiar proceſs. In the ſpring time, when the ſap is moſt free in running, they pare off the bark of the pine-tree, to make the ſap run down into a hole which they cut at the bottom to receive it: in the way, as it runs down, it leaves a white matter like cream, but a little thicker: this is very different from all the kinds of reſin and turpentine in uſe, and it is generally ſold to be uſed in the making of flambeaux, inſtead of white bees wax. The matter that is received in the hole at the bottom, is taken up with ladles, and put in a large baſket; a great part of this immediately runs through, and this is the common turpentine. This is received into ſtone or earthen pots, and is ready for ſale. The thicker matter, which remains in the baſket, they put into a common alembic, adding a large quantity of water; they diſtil this as long as any oil is ſeen ſwimming upon the water; this oil they ſeparate from the ſurface in large quantities, and this is the common oil or ſpirit of turpentine; the remaining matter, at the bottom of the ſtill, is common yellow reſin. When they have thus obtained all that they can from the ſap of the tree, they cut it down, and, hewing the wood into billets, they fill a pit dug in the earth with theſe billets, and, ſetting them on fire, there runs from them, while they are burning, a black thick matter; this naturally falls to the bottom of the pit, and this is the tar. The top of the pit is covered with tiles, to keep in the heat; and there is at the bottom a little hole, out at which the tar runs like oil: if this hole be made too large, it ſets the whole quantity of the tar on fire; but, if ſmall enough, it runs quietly out.

The tar, being thus made, is put up in barrels, and, if it be to be made into pitch, they put it into large boiling veſſels, without adding any thing to it: it is then ſuffered to boil a while, and, being then let out, is found, when cold, to be what we call pitch. *Phil. Tranſ.* N°. 243.

PINE-APPLE, the ſame with ananas. See the article ANANAS

PINEAL GLAND, in anatomy, a gland in the third ventricle of the brain, thus called from its reſemblance to a pine-apple. It is of a greyiſh colour, and its proceſſus and baſe are often medullary: this gland has often by many been ſuppoſed the peculiar ſeat of the ſoul. It is otherwiſe called conoides and conarion. See CONOIDES and CONARION.

PINION, in mechanics, an arbor, or ſpindle, in the body of which are ſeveral notches, which catch the teeth of a wheel that ſerves to turn it round; or it is a leſſer wheel which plays in the teeth of a larger.

In a watch, &c. the notches of a pinion, which are commonly 4, 5, 6, 7, 8, &c. are called leaves, and not teeth, as in other wheels.

PINK, *Caryophyllus*, in botany, the Engliſh name of ſeveral ſpecies of the dianthus. See DIANTHUS.

PINNA, in anatomy. The lateral and inferior part of the noſe is called pinna naſi; and the ſuperior and broad part of the external ear is denominated pinna auris. See EAR and NOSE.

PINNACE, among ſeamen, a ſmall veſſel with two maſts, employed in the coaſting trade, particularly in Newfoundland, and other parts of North-America: alſo the name of a particular kind of boat commonly rowed with eight oars.

PINNATED LEAVES, *pinnata folia*, in botany, leaves formed in manner of a wing, and compoſed of two large ranges, or ſeries of foliola, annexed to the two ſides of one common, oblong petal. Of the pinnated leaves, however, there are ſeveral kinds. 1. The pinnated with an odd one: this expreſſes the pinnated leaf, when beſides the two ſeries juſt mentioned, there is an odd leaf at the extremity of the petiole. 2. The pinnated without an odd leaf. 3. The pinnated abrupt leaf; this expreſſes a pinnated leaf, in which there is neither an odd leaf, nor a tendril at the end of the petiole. 4. The oppoſitely pinnated, which is when the folioles ſtand oppoſite to one another, on the common petiole. 5. The alternately pinnated, when the folioles ſtand not oppoſite, but alternately. 6. The interruptedly pinnated, in which the folioles are irregular and unequal in ſize and ſituation. 7. The cirrhatedly pinnated, wherein the extremity of the petiole has one or more tendrils, inſtead of an odd leaf. 8. The decurrently pinnated, in which the folioles extend beyond their proper baſe, in going down the petiole, and, as it were, make it alated. The membranaceous pinnated, of the ſame form with the laſt, but with the petioles themſelves membranaceous and articulated. 9. The conjugated pinnated leaf, when the whole compound leaf conſiſts only of two folioles, on the petiole: this kind of pinnated leaf may be either abrupt, cirrhated, membranaceous in the petiole, or ſtipulated. 10. Duplicato-pinnatum, or pinnato-pinnatum, expreſſes a leaf compoſed of ſeveral others, each of which is itſelf compoſed of ſeveral ſmaller leaves, or foliola. 11. Triplicato-pinnatum expreſſes a leaf, the petioles of which ſend out three alated ſubdiviſions, before it has any leaves on it. 12. Theſe laſt are terminated ſometimes by two foliola each, and in that caſe, are ſaid to be abrupt; ſometimes by an odd leaf, and are then called triplicato-pinnata cum impari.

PINNING, in building, the faſtening of tiles together, with pins of heart of oak, for the covering of an houſe, &c.

PINT, a veſſel, or meaſure uſed in eſtimating the quantity of liquids, and even ſometimes of dry things. See the article MEASURE.

PINTLE, among gunners, an iron, which ſerves to keep the gun from recoiling.

PINTLES, in ſhip-building, certain pins or hooks of iron bolted to the ſtern-poſt whereon to hang the rudder, which reſts and traverſes upon the pintles. See the article HELM.

PINUS, in botany. See PINE.

PIONEER, in the art of war, a labourer employed in an army to ſmooth the roads, paſs the artillery along, and dig lines and trenches, mines, and other works.

PIONY, in botany. See PÆONIA.

PIP, or PEP, *Pepia*, a diſeaſe among poultry, conſiſting of a white thin ſkin, or film, that grows under the tip of the tongue, and hinders their feeding. It uſually ariſes from want of water, or from the drinking puddle-water, or eating filthy meat. It is cured by pulling off the film with the fingers, andrubbing the tongue with ſalt.

ſalt. Hawks are particularly liable to this diſeaſe, eſpecially from feeding on ſtinking fleſh.

PIPE, in building, &c. a canal, or conduit, for the conveyance of water and other liquids. Pipes for water, water-engines, &c. are uſually of lead, iron, earth, or wood: the latter are uſually made of elm or elder. Thoſe of iron are caſt in forges; their uſual length is about two feet and a half; ſeveral of theſe are commonly faſtened together by means of four ſcrews at each end, with leather or old hat between them, to ſtop the water. Thoſe of earth are made by the potters; theſe are fitted into one another, one end being always made wider than the other. To join them the cloſer, and prevent their breaking, they are covered with tow and pitch: their length is uſually about that of the iron-pipes. The wooden pipes are trees bored with large iron augres, of different ſizes, beginning with a leſs, and then proceeding with a larger ſucceſſively; the firſt being pointed, the reſt being formed like ſpoons, increaſing in diameter, from one to ſix inches or more: they are fitted into the extremities of each other.

Wooden pipes are bored by hand in the ſame manner as common pumps; but as this is both tedious and expenſive, ſeveral machines have been invented for this purpoſe: we have given a draught of that generally uſed for this purpoſe in England on plate CI. *fig.* 1. and 2. where A is the ſhaft of a wheel turned either by water or horſes. Into the extremity of this ſhaft, the ſhank B of the augre C is faſtened; and by its revolution the pipe D is bored. As the augre advances into the pipe, the carriage on which the pipe is faſtened is drawn forwards by means of the wheel H, which the borer, or man who tends the machine, turns round by means of the handles on its circumference. Half this wheel is below the ſurface of the ground, that the rope F I, by which the carriage is pulled forward, may be drawn in a parallel direction. As ſoon as the augre is full, which is known by the noiſe it makes, the carriage, together with the pipe, is pulled backward, by which means the augre comes out of the pipe, and drops its contents into the pit underneath the carriage. This motion is performed by the machine, in the following manner: On the ſhaft A is a cog-wheel K, which revolves with the ſhaft. On each ſide of this cog-wheel are two other wheels of ſomething leſs diameter, fixed in a ſliding frame, and moveable by means of a lever. One of theſe wheels is marked L, and the other M; but the latter cannot be ſeen in *fig.* 1. By puſhing the lever N O towards either ſide, the wheel oppoſite to that ſide towards which the lever is puſhed, ſtrikes into the cog-wheel K. Thus if the man at H draws the lever towards him, the rope Q is drawn up round the axis, and by paſſing through the pulley R, draws back the carriage. As ſoon as the augre is emptied, he puſhes the lever from him, by which means the wheel L ſtrikes into the cogs of K, and by that means draws the carriage forward. In this manner he proceeds till the pipe is bored. T, V, are two ſupports for bearing the weight of the augre and its ſhank. The former is fixed upon the floor, and the latter on the frame which carries the piece.

Leaden pipes are of two ſorts, the one ſodered, the other not ſodered; for the conſtruction of each ſort, ſee the article PLUMBERY.

It appears from what has been ſaid under the article FLUID, that we can not only conduct water into pipes to very great diſtances, but bring it from one mountain to another, in pipes that go down into the interjacent vallies, and come up again, provided the reſervoir into which we bring the water, be ſomething lower than the ſpring from whence it comes, and whence the pipes begin: but it is neceſſary that we ſhould here take notice of ſome impediments that often ariſe in practice, and ſhew how to prevent or remedy them: the chief of theſe impediments ariſes from air in the pipes, by which the water is ſaid to be wind-bound; by theſe means, a pipe of two or three inches bore, will ſometimes not give more water than if it was but of one inch bore. The air may be diſcharged, and the pipe relieved, thus: let A, B, C, D, (pl. XCIX. *fig.* 6) be the ſpring from which a pipe is to bring water to the delivery at E, which ſuppoſe a mile from the ſpring. Now we will ſuppoſe E to be a little lower than D; for example, four or five feet. If the ſurface of the water in the ſpring, comes down to the mouth of the pipe at D, or ſometimes near it, there will be a good deal of air that will run down with the water into the pipe; and wherever the ground riſes in the conduit of the pipe, this air will lodge itſelf in the upper parts of the pipe, as *a o m r*, and thereby diminiſh the water-way of the pipe, ſo as to force the water to paſs between *o* and *n*, a paſſage perhaps ten times leſs than the pipe when free. The way to clear the pipe of this air, is by going from D, along the pipe; when you come to the firſt riſing ground, drive a nail at the higheſt part of the pipe, as at *m*, ſo as to make a hole through it: then taking out the nail, the air will blow out violently till at laſt the water ſucceeds the air: then let the hole be quite ſtopped up; and doing this at every eminence of the pipe, the whole air will be diſcharged, and the full quantity of water will be brought home at E. If the ſpring be very much higher than the place of delivery, the places of the air in the pipe will not be juſt at the higheſt part of the pipe, but a little beyond it; becauſe the water running with greater velocity and force, drives the lodged air forward, as may be ſeen at *o p g*, which otherwiſe would have been at *s*; and therefore the hole muſt be made beyond *s*. If the end E be ſtopped for ſome time, ſo that the water may ceaſe to be in motion, the air will go back gradually, and appear at *u y w t*, where it may be let out.

But Dr. Deſaguliers propoſes to clear the pipes of air, by means of a ſmall pipe, which he calls a rider, laid over the eminent part of the main of a pipe, as *d e f*, (*fig.* 7.) communicating with the main at the top of the eminence, as at *e*, with a little branch and cock C, which being opened when the engine is working, the air, being puſhed forward, is catched at *d*, and diſcharged by the cock. The doctor contrived an invention which he calls a Jack-in-the-box, whereby air-cocks would open and ſhut of themſelves, by the running of the water, and motion of the air only. This contrivance is deſcribed in the Philoſophical Tranſactions, N° 393.

Tobacco-PIPE, a machine uſed in the ſmoaking of tobacco, conſiſting of a long tube, made of earth or clay, having at one end a little caſe, or furnace, called the bowl, for the reception of the tobacco, the fumes whereof are drawn by the mouth through the other end. Tobacco-pipes are made of various faſhions; long, ſhort, plain, worked, white, varniſhed, unvarniſhed, and of various colours, &c. The Turks uſe pipes three or four feet long, made of ruſhes, or of wood bored, at the end whereof they fix a kind of a pot of baked earth, which ſerves as a bowl, and which they take off after ſmoaking.

PIPE alſo denotes a veſſel or meaſure for wine, and things meaſured by wine-meaſure. See the article MEASURE.

PIPE, in mining, is where the ore runs forwards endways in a hole, and doth not ſink downwards, or in a vein.

PIPER, pepper. See PEPPER.

PIQUETTES, among floriſts, a term uſed for a certain ſort of carnations, which have always a white ground and are ſpotted, or, as they call it, pounced with ſcarlet, red, purple, and other colours.

PIRATE, PYRATE, or ROVER, *Pirata*, a perſon, or veſſel, that robs on the high ſeas, without permiſſion or authority of any prince or ſtate.

When a pirate enters into any port or haven, and there robs a merchant's ſhip, this is not held to be piracy, becauſe it is not done on the high ſea; but it is a robbery at the common law. In caſe a ſhip is riding at anchor on the ſea, and it happens that the mariners or ſeamen are part in their boat, and the reſt on ſhore, by which accident none are left in the ſhip; here, if a pirate ſhall attack her, and commit a robbery, the ſame is piracy. Nevertheleſs, the taking, by a ſhip at ſea, in great neceſſity of victuals, cables, ropes, &c. ſuch things out of another veſſel, is not ſo, where that other veſſel can ſpare ſuch things, and the takers pay or give ſecurity for them.

The manner of trying a pirate is by a ſpecial commiſſion, directed to the lord high admiral, &c. and the offence of piracy may be heard and determined, as if the robbery was committed on land; and offenders ſhall ſuffer the like pains of death, loſs of lands and goods, &c. Perſons,

ſons combining to yield up ſhips to pirates, or to lay violent hands on the commanders of ſhips, or that correſpond with any pirate, are adjudged guilty of piracy.

PISCES, in aſtronomy, the twelfth ſign or conſtellation of the zodiac. The ſtars in Piſces, in Ptolemy's catalogue, are 38; in Tycho's, 33; and in the Britannic catalogue, 109.

PISCINA, in antiquity, a large baſon in a public place or ſquare, where the Roman youth learned to ſwim, and which was ſurrounded with a high wall, to prevent caſting of filth into it.

PISCIS VOLANS, in aſtronomy, a ſmall conſtellation of the ſouthern hemiſphere, unknown to the ancients, and inviſible to us in theſe northern regions.

PISSASPHALTUM, earth-pitch, in natural hiſtory, a fluid, opake, mineral body, of a thick conſiſtence, of a ſtrong ſmell, readily inflammable, but leaving a reſiduum of greyiſh aſhes, after burning. It ariſes out of the cracks of rocks, in ſeveral places in the iſland of Sumatra, and in ſome other parts of the Eaſt-Indies, and is much eſteemed there, in paralytic diſorders. It is greatly recommended by the ancients as an emollient, maturant, and digeſtive, and was uſed in cataplaſms for ripening all ſorts of tumours, and againſt the ſciatica, and other pains of the limbs.

PISSELÆUM INDICUM, Barbadoes tar, in natural hiſtory, a mineral fluid, of the nature of the thick bitumens, and of all others the moſt approaching, in appearance, colour, and conſiſtence, to the true piſſaſphaltum, though differing from it in other reſpects. It is very frequent in many parts of America, where it is found trickling down the ſides of mountains in large quantities, and ſometimes floating on the ſurface of the waters: but it ſeems to be almoſt loſt at this time in the iſland of Barbadoes, from whence it was originally named. It has been greatly recommended internally in coughs and other diſorders of the breaſt and lungs; but it is ſeldom to be met with genuine.

PISTACHIA, in botany, a genus of plants, whoſe fruit is an oblong, pointed nut, about the ſize of a filberd; including a kernel of a pale greeniſh colour, covered with a reddiſh ſkin. It is the produce of a large tree, with winged leaves reſembling thoſe of the aſh, which grows ſpontaneouſly in the Eaſtern countries, and bears the colds of our own.

Piſtachia nuts have a pleaſant ſweetiſh unctuous taſte, reſembling that of ſweet almonds; their principal difference from which conſiſts in their having rather a greater degree of ſweetneſs, accompanied with a light grateful flavour; and in being more oily, and hence ſomewhat more emollient, and perhaps more nutritious. They have been ranked among the principal analeptics, and greatly eſteemed by ſome in certain weakneſſes and emaciations. They are taken chiefly in ſubſtance, their greeniſh hue rendering them unſightly, in the form of an emulſion. They are very liable to grow rancid in keeping.

PISTIL, among botaniſts, denotes the female organ of generation in plants; it conſiſts of three parts, the germen, ſtyle, and ſtigma: the germen ſupplies the place of an uterus in plants, and is of various ſhapes, but always ſituated at the bottom of the piſtil, and contains the embryo-ſeeds: the ſtyle is a part of various forms alſo, but always placed on the germen: and the ſtigma is alſo of various figures, but always placed on the top of the ſtyle, or, if that be wanting, on the top of the germen.

PISTOL, the ſmalleſt piece of fire-arms, borne at the ſaddle-bow, on the girdle, and in the pocket.

PISTOLE, a gold-coin ſtruck in Spain, and in ſeveral parts of Italy, Switzerland, &c.

The piſtole has its augmentations and diminutions, which are quadruple piſtoles, double piſtoles, and half-piſtoles.

PISTON, *Embolus*, in pump-work, is a ſhort cylinder of metal, or other ſolid ſubſtance, fitted exactly to the cavity of the barrel or body of the pump. See the article PUMP.

PISUM, pea, in botany, a genus of plants, producing papilionaceous flowers; the vexillum is broad, heart-ſhaped, reflexed, emarginated, and ending in a point; the alæ are roundiſh, connivent, and ſhorter than the vexillum; the carina is compreſſed, ſemilunulated, and ſhorter than the alæ; the fruit is a large, long, unilocular, and bivalve pod, containing ſeveral globoſe ſeeds. The ſtalks of the pea plant are long, hollow, and of a ſea-green colour; the leaves are oblong, and of the ſame colour; and ſome are ſo placed that the ſtalks ſeem to run through them, while others grow by pairs on the ribs, that are terminated by tendrils, which lay hold of every thing they meet with.

The common white pea ſucceeds beſt in a light land, ſomewhat rich; the time of ſowing them is in the middle of April. Three buſhels are the common allowance for an acre; and they kill the weeds the land is ſubject to, better than any other crop. In Staffordſhire they ſow the garden rouncivals in fields, and they grow and yield very well, though they are left trailing upon the ground without any ſupport of ſticks.

The white and rouncival peaſe are only to be ſown with a broad caſt, and harrowed in; but the common grey pea, which is more frequently ſown in fields than either of them, muſt be ſown under furrow, and delights moſt in a cold wet clay. Theſe are to be ſown in February; and the common quantity of ſeed is two buſhels to an acre. The blue pea is the beſt kind for light ſandy land, and is to be early ſown; all peaſe love land manured with lime or with marle. In Suffolk they plow up their lays in the beginning of March, and, turning the turf well, they have a croſs ſtick ſet with iron pegs, which they ſtrike down with their feet: theſe pegs make holes at equal diſtance; into which they have boys and girls following to drop the peaſe ſingly, till all the land is ſet. As ſoon as this crop is cut, they plow the land acroſs, and, harrowing it well, they plow it again, and ſow it about Michaelmas with wheat, and the next year with barley, then with oats; after which the land requires new improvement. *Mortimer's Huſbandry.*

PITCH, a tenacious oily ſubſtance, drawn chiefly from pines and firs, and uſed in ſhipping, medicine, and various other arts: or it is more properly tar, inſpiſſated by boiling it over a ſlow fire. See the article PINE.

Pitch acquires different names, according to its different preparations, colours, and qualities: as it diſtils from the wood, it is called barras; but afterwards it aſſumes a double name, the fineſt and cleareſt being called galipot, and the coarſer marbled barras. Of the galipot is made what is called white pitch, or Burgundy pitch, which is nothing but the galipot melted with oil of turpentine; though ſome will have it a native pitch, diſtilling from a reſinous tree growing in the mountains of Franche Comte.

PITCHING, in naval affairs, the act of plunging or falling headlong into a ſea, when the wave, by which the ſhip's fore-part is lifted up, is ſuddenly withdrawn from under the prow.

Pitching is often extremely dangerous to a veſſel, as it ſtrains both the hull and the maſts to a great degree, and frequently carries away the latter by a violent jerk.

PITH, in vegetation, the ſoft ſpongy ſubſtance contained in the central parts of plants and trees. As the ſubſtance of the trunk in trees, ſays Boerhaave, become more woody, the pith is compreſſed, and ſtraitened to ſuch a degree, that it wholly diſappears. It is plain from this, that the office of the pith, in vegetation, cannot be very great, ſince it is not of perpetual duration. By its ſpongy ſtructure, it ſeems fitted to receive any ſuperfluous moiſture that might tranſude through the pores of the woody fibres. If by ſuch moiſture, or from any other cauſe, it happens to rot and periſh, as frequently happens in elms, the tree is found to grow full as well without it; a proof it is of no eſſential uſe in vegetation.

PITUITARY GLAND, in anatomy, a gland in the brain, of the ſize of a very large pea, placed under the cella of the os ſphenoides, under the infundibulum, wherewith it communicates, receiving from it a lymph or a juice, which the infundibulum derives from the plexus choroides and pineal gland; and from this lympha does the gland itſelf

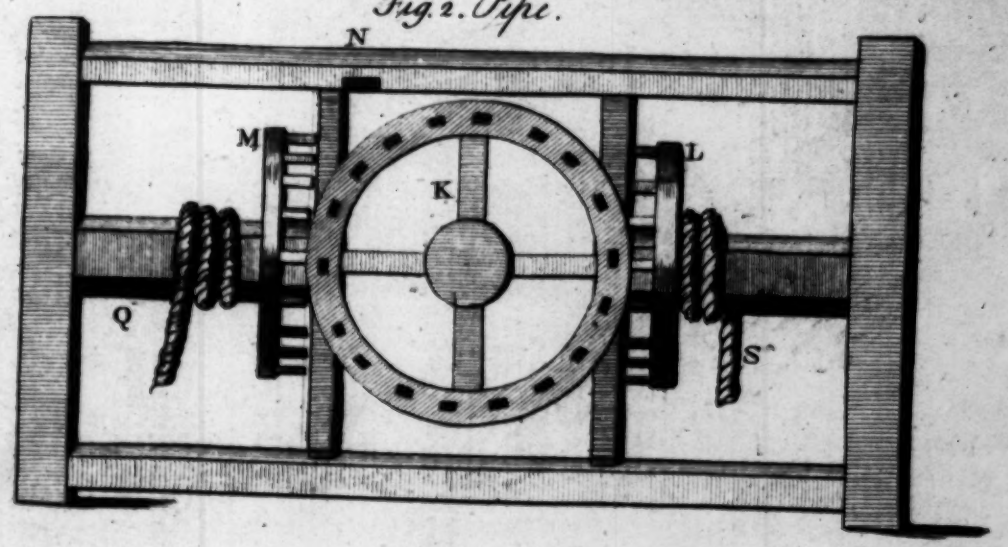

Fig. 1. Pipe.

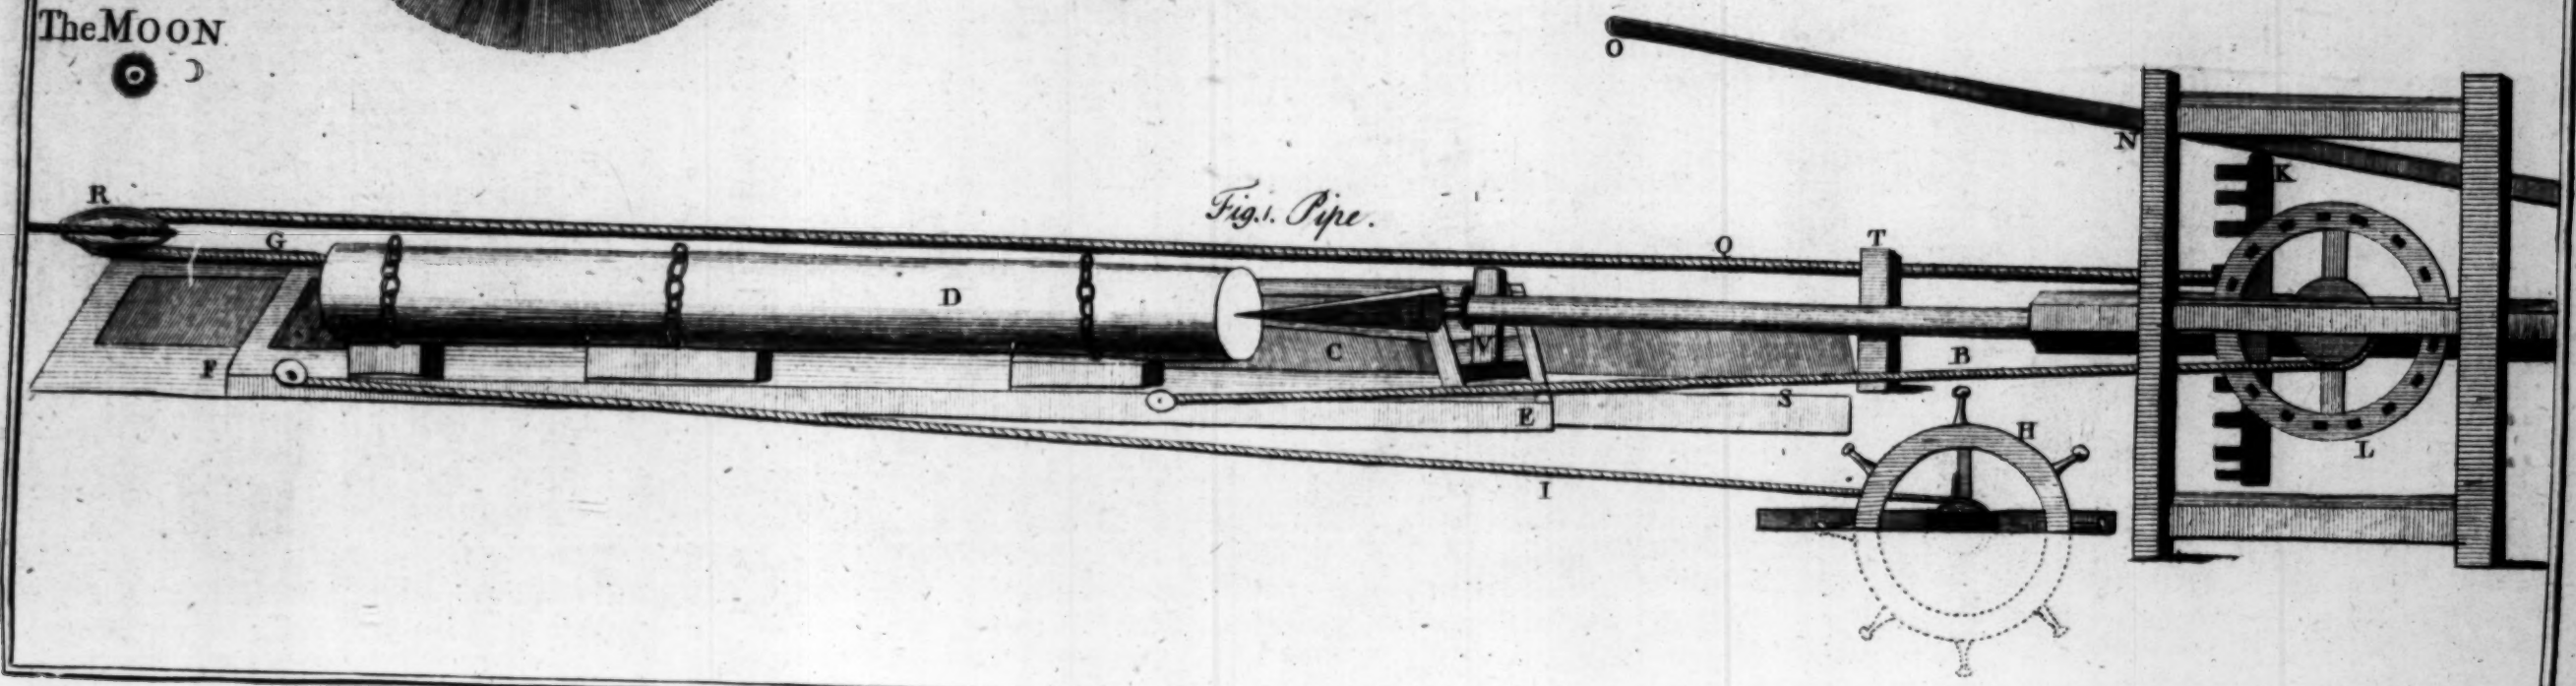

5 JA 59

itſelf take its name. It alſo filtrates a juice itſelf, ſeparating from the blood a white liquor, very ſubtile, and apparently very ſpirituous.

PIVAT, or PIVOT, a foot or ſhoe of iron, or other metal, uſually conical, or terminating in a point, whereby a body, intended to turn round, bears on another fixed at reſt, and performs its circumvolutions. The pivot uſually bears or turns round in a ſole, or piece of iron or braſs, hollowed to receive it.

PLACARD, or PLACART, among foreigners, ſignifies a leaf or ſheet of paper, ſtretched out, and applied on a wall or poſt, containing edicts, regulations, &c. Among us, placard ſignifies a licence, whereby a perſon is permitted to uſe unlawful games, &c.

PLACARD, in architecture, denotes the decoration of the door of an apartment, conſiſting of a chambranle, crowned with its frieze or gorge, and a corniche, ſometimes ſupported by conſoles. See DOOR.

PLACE, *Locus*, in philoſophy, a mode of ſpace, or that part of immoveable ſpace which any body poſſeſſes. See SPACE.

Place is to ſpace or expanſion, ſays Mr. Locke, as time is to duration. Our idea of place is nothing but the relative poſition of any thing with reference to its diſtance from ſome fixed and certain points. Whence we ſay, that a thing has or has not changed place, when its diſtance either is or is not altered with reſpect to thoſe bodies with which we have occaſion to compare it. That this is ſo, continues that great philoſopher, we may eaſily gather from hence, that we have no idea of the place of the univerſe, though we can of all its parts. To ſay that the world is ſomewhere, means no more than it does exiſt: however, the word place is ſometimes taken to ſignify that ſpace which any body takes up; and in this ſenſe, according to the ſame author, the univerſe may be conceived in a place; but he thinks that this portion of infinite ſpace poſſeſſed by the material world, might more properly be called extenſion.

Ariſtotle, and his followers, conceive place to be the immoveable and contiguous concave ſurface of an ambient body; ſo that, as Mr. Boyle obſerves, it is a kind of veſſel, which every way contains the body lodged in it; only with this difference, that a veſſel is a kind of moveable place: hence it has been uſually affirmed, that what is in no place, is not at all: yet it appears not, ſays the laſt mentioned author, how the outermoſt heaven can be called a place, ſince theſe philoſophers aſſerting the world to be finite, muſt grant there is no ambient body without it to contain it; and if the outermoſt heaven ſhould be impelled by the power of God in a ſtraight line, this or that way, there would enſue a motion without a change of place; for the outermoſt heaven which was in none before, does not by its progreſſion come to be contained by a new ambient body; and, in this caſe, even according to the favourers of Ariſtotle, who approve Des Cartes' definition of local motion, the world may be ſaid to move without changing place; for it does not paſs from the neighbourhood of ſome bodies to that of others; ſince compriſing all bodies, and yet being bounded, there is no body for it to leave behind, nor any beyond for it to approach. See the article MOTION.

Ariſtotle divides ſpace into external and internal; the firſt being that already conſidered, includes or contains the body; and the other, that ſpace or room which the body contains. But Sir Iſaac Newton better and more intelligibly diſtinguiſhes place into abſolute and relative; abſolute or primary place being that part of infinite and immoveable ſpace which a body poſſeſſes; and relative or ſecondary place being the ſpace it poſſeſſes, conſidered with regard to the other adjacent bodies.

Optical PLACE, the point to which the eye refers an object.

The optic place of a ſtar is a point of the ſurface of the mundane ſphere, wherein a ſpectator ſees the center of a ſtar. See PARALLAX.

PLACE *of Radiation*, is the ſpace in a medium or tranſparent body through which any viſible object radiates.

The place of the ſun, ſtar, &c. alſo denotes the ſign and degree of the zodiac which the luminary is in; or the degree of the ecliptic, reckoning from the beginning of Aries, which the planet or ſtar's circle of longitude cuts; and therefore coincides with the longitude of the ſun, planet, or ſtar. As the ſine of the ſun's greateſt declination 23° 30′: to the ſine of any preſent declination given or obſerved, for inſtance, 23° 15′:: ſo is the radius 10: to the ſine of his longitude 81° 52′; which, if the declination were north, would give 20° 52′ of Gemini; if ſouth, 20° 52′ of Capricon for the ſun's place. See DECLINATION, &c.

The place of the moon being that part of her orbit wherein ſhe is found at any time, is of various kinds, by reaſon of the great inequalities of the lunar motions, which render a number of equations and reductions neceſſary before the juſt point be found. The moon's fictitious place is her place once equated; her place nearly true, is her place twice equated; and her true place is her place thrice equated. See MOON.

Excentric PLACE *of a Planet*. See the article EXCENTRIC.

Geocentric PLACE *of a Planet*. See the article GEOCENTRIC.

Heliocentric PLACE *of a Planet*. See the article HELIOCENTRIC.

PLACE, in geometry. See LOCUS.

PLACE, in war, a general name for all kinds of forteſſes where a party may defend themſelves: thus, 1. A ſtrong or fortified place, is one flanked, and covered with baſtions. 2. A regular place, one whoſe angles, ſides, baſtions, and other parts, are equal; and this is uſually denominated from the number of its angles, as a pentagon, hexagon, &c. 3. Irregular place, is one whoſe ſides and angles are unequal. 4. Place of arms, is a ſtrong city or town pitched upon for the chief magazine of an army; or in a city or garriſon, it is a large open ſpot of ground, uſually near the center of the place, where the grand guard is commonly kept, and the garriſon holds its rendezvous at reviews; and in caſes of alarm to receive orders from the governor. 5. Place of arms of an attack, in a ſiege, is a ſpacious place covered from the enemy by a parapet or epaulement, where the ſoldiers are poſted ready to ſuſtain thoſe at work in the trenches againſt the ſoldiers of the garriſon. 6. Place of arms particular, in a garriſon, a place near every baſtion where the ſoldiers ſent from the grand place to the quarters aſſigned them, relieve thoſe that are either upon the guard or in ſight. 7. Place of arms without, is a place allowed to the covert-way for the planting of cannon, to oblige thoſe who advance in their approaches to retire. 8. Place of arms in a camp, a large place at the head of the camp for the army to be ranged in and drawn up in battalia. There is alſo a place for each particular body, troop, or company, to aſſemble in. See the articles CAMP, TROOP, &c.

PLACE, in logic and oratory, denotes the ſeat or ſource of an argument, of which there are two kinds, inartificial and artificial; the firſt is the place of teſtimony, authority, &c. the ſecond, that of reaſon, as when we argue from univerſals, cauſes, &c.

Common PLACE. See COMMON *Place*.

PLACENTA, in anatomy, a ſoft roundiſh maſs found in the womb of pregnant women; which, from its reſemblance to the liver, was called by the ancients hepar uterinum, the uterine liver.

The number of placentæ in human ſubjects, anſwers to that of the fœtuſes; and as theſe are uſually ſingle, the placenta is uſually ſo too: but when there are two or more fœtuſes, there are always as many placentæ; yet in this caſe they often cohere together ſo as to ſeem but one; but even in this caſe, their veſſels do not communicate from one to the other.

The placenta is about eight or nine inches in diameter, and about an inch in thickneſs. Its convex and ſpongy part is connected to the uterus, by means of a very thin and fine membrane, which is reticulated, villoſe, and continuous with the chorion. Its concave part is turned towards the fœtus, and ſhews a multitude of very large veſſels: it is joined to the navel-ſtring, and ſurrounded with a ſmooth membrane from the chorion and amnios. It has no certain part of the uterus to adhere to; but is uſually fixed to its bottom. Its ſubſtance, according to Ruyſch and Heiſter, is truly vaſcular, or compoſed ſolely and entirely

tirely of the umbilical veins and arteries, interwoven in a very curious manner.

The uſe of the placenta is, together with the chorion, to abſorb the nutritious juices from the mother's uterus, as the inteſtines do the chyle; and finally to tranſmit it to the fœtus, by means of the umbilical veins. And it probably ſerves to refund again to the parent, the blood and urine of the fœtus, by the umbilical arteries.

PLACENTA is alſo a term uſed, by ſome botaniſts, for what is more uſually called the receptacle of the ſeeds. See the article RECEPTACLE.

PLACITA, PLEAS, in a law-ſenſe. See the article PLEA.

PLACITUM, in law, a ſentence of a court, or an opinion, decree, or ordinance.

PLAFOND, or PLAFOUND, in architecture, the ceiling of a room, whether it be flat or arched, lined with plaſter or joiner's work, and frequently enriched with painting.

The word plafond is alſo more particularly uſed for the bottom of the projecture of the larmier of the corniche, called alſo ſoffit. See SOFFIT.

PLAGIARY, in philology, the purloining another perſon's works, and putting them off for a man's own.

PLAGUE, a moſt acute fever, ariſing from a poiſonous miaſma, brought from Oriental countries, which unleſs it is immediately expelled out of the body, by the ſtrength of the vital motions, by buboes and carbuncles, proves fatal.

In this, as well as in moſt contagious diſeaſes, ſays Hoffman, the venomous miaſma is ſwallowed with the air, and inſinuates itſelf into the ſalival juice; whence it aſſaults the head, brain, nerves, and animal ſpirits; producing a torpor in the head, a heavineſs, a ſleepineſs, a violent pain, a ſtupor of the ſenſes, a forgetfulneſs, inquietude, watching, and loſs of ſtrength. From the fauces it proceeds to the ſtomach, creating a loathing of food, nauſeas, anxiety of the precordia, cardialgia attended with fainting, reaching to vomit, and vomiting itſelf. Hence it proceeds to the membranes of the ſpinal marrow, the coats of the arteries, producing horrors, a languid, ſmall, contracted, quick pulſe, and even fainting. All which are generally ſigns and ſymptoms of the plague, which are of a more violent and quick operation in proportion to the virulence of the peſtilential miaſma. This diſeaſe differs from other contagious, malignant, and eruptive fevers, becauſe it is the moſt acute, and ſometimes kills on the firſt, and ſometimes on the ſecond day. In our climate it is not epidemic or ſporadic, from a bad way of living, or an unhealthful air, but happens when it is moſt ſalutary, from contagion alone, and is imported from hot countries where this diſeaſe rages. It will not only abate by intenſe cold, but be perfectly extinguiſhed: wherefore in a cold ſeaſon and very cold countries, it either does not appear at all, or in a very mild degree; whereas if the climate is hot, it is not only moſt violent, but moſt common.

All plagues are not of the ſame nature, but vary according to different conſtitutions and circumſtances; but all who have written of the plague univerſally agree, that ſpongy and porous bodies, of an obeſe habit, of a ſanguine and phlegmatico-ſanguine conſtitution, women, young perſons and children, perſons of a timid diſpoſition, that are poor, live hard, or are given to luxury, and ſit up late at night, are more apt to be afflicted with this diſeaſe than the ſtrong and intrepid, lean, nervous, endued with large veſſels, men, old perſons obnoxious to the hæmorrhoidal flux, and who have iſſues and open ulcers. Nothing brings on this diſtemper ſooner than fear, a dread of death, and a conſternation of the mind. If the peſtilential poiſon is not expelled to the external parts, it is certainly fatal; nor is this to be done, according to Hoffman, as in other fevers, by large ſweats, by ſtools, by a flux of urine, by bleeding at the noſe, either natural or artificial: for theſe threaten deſtruction. The ſalutary and critical excretion which perfectly ſolves the peſtilential diſeaſe is by tumours in the ſurface of the body, not otherwiſe than the eryſipelas, between the third and fourth day, and the ſooner the better, becauſe then the ſymptoms are mitigated. That there is poiſon contained in theſe tumours appears from hence, that if the ſurgeon opens any of the tumours with his lancet, and then bleeds a ſound man with the ſame, he will be immediately ſeized with the plague. The peſtilential tumours are of two kinds; the firſt ariſes in the glandulous places, moſt commonly in the groin and arm pits; ſometimes in the parotid and mammary glands, as alſo the lower maxillary, and in thoſe near the aſpera arteria. The deſcription and treatment of the tumours, may be ſeen under the article *Peſtilential* BUBO.

The other ſort is the anthrax, or carbuncle, and is already treated of under the article CARBUNCLE.

As in the ſmall-pox the management conſiſts in clearing the primæ viæ in the beginning, in regulating the fever, and in promoting the natural diſcharges; ſo in the plague, the ſame indications will take place. When the fever is very acute, a cool regimen is neceſſary: but when the pulſe is languid, and the heat not exceſſive, moderate cordials muſt be uſed. The moſt gentle emetics may be given; the beſt is ipecacuhana, if the ſtomach or bowels are not inflamed, for in that caſe certain death may be expected. In France they bleed about twelve ounces on the firſt day, and then four or five ounces every two hours after. This, they ſay, had extraordinary ſucceſs with the aſſiſtance only of cooling ptiſans, and ſuch like drinks, which they gave plentifully at the ſame time. Sydenham adviſes, that ſweating be continued without intermiſſion. Dr. Mead recommends an infuſion of Virginia ſnake-root in boiling water, as the moſt proper ſudorific; or for want of that, ſome other warm aromatic, with the addition of about a fourth part of aqua theriacalis. Thoſe who are obliged to be near the ſick, muſt take care that the miaſmata do not approach the vital juices, nor yet the ſalival, to which purpoſe phyſicians recommend frequent ſpitting, and waſhing the mouth with vinegar or wine, or ſnuffing them up the noſe. The efficacy will be ſtill greater if they are imbued with rue, or citron-rind. It will be likewiſe proper to get a few ſpoonfuls of Rheniſh-wine, or Bezoardic vinegar diluted with water or wine, and ſo take them. The Turks deal much in the juice of lemons. Externally many recommend the uſe of iſſues, becauſe the matter of the miaſma is wont to adhere to the ſerous part of the blood, and to be brought by the ſtrength of nature to the place where the iſſue is made. When the plague is actually begun, and the body is coſtive, a gentle clyſter ſhould be uſed. Then a ſweat ſhould be promoted twenty-four hours at leaſt, that the poiſon may exhale and paſs through the ſkin; and epithems to the heart will not be without benefit: they may be made of theriac, expreſſed oil of nutmegs, camphor, ſaffron, caſtor, and balſam of Peru. Langius recommends bleeding after ſweating: but above all acids are highly praiſed, ſuch as juice of citrons, Seville-oranges, lemons, vinegar, &c. When the ſtrength of the diſeaſe is vanquiſhed, gentle laxatives will be proper to expel the ſordes during the courſe of the diſeaſe. Mindererus aſſerts, that unleſs alexiterials be given twenty-four hours, all medicines are vain.

PLAIN, *Planus*, in general, an appellation given to whatever is ſmooth and even, or ſimple, obvious, and eaſy to be underſtood; and, conſequently, ſtands oppoſed to rough, enriched, or laboured.

A plain figure, in geometry, is an uniform ſurface; from every point of whoſe perimeter, right lines may be drawn to every other point in the ſame.

A plain angle is one contained under two lines, or ſurfaces, in contradiſtinction to a ſolid angle. See ANGLE.

The doctrine of plain triangles, as thoſe included under three right lines, is termed plain trigonometry. See TRIGONOMETRY.

PLAIN *Chart*. See CHART.

PLAIN *Sailing*. See SAILING.

PLAIN *Scale*. See SCALE.

PLAIN *Table*, in geometry, &c. an inſtrument uſed in the ſurveying of lands, whereby the plan is taken on the ſpot, without any future protraction.

The table itſelf is a parallelogram of oak, or other wood (plate XCIX. *fig.* 8.) about fifteen inches long, and twelve broad, conſiſting of two ſeveral boards, round which are ledges of the ſame wood; the two oppoſite of which being taken off, and the ſpangle unſcrewed from the

the bottom, the aforeſaid two boards may be taken aſunder for eaſe and conveniency of carriage. For the binding of the two boards and ledges faſt, when the table is ſet together, there is a box-jointed frame, about three quarters of an inch broad, and of the ſame thickneſs as the boards, which may be folded together in ſix pieces. This frame is ſo contrived, that it may be taken off and put on the table at pleaſure, and may go eaſily on the table, either ſide being upwards. This frame alſo is to faſten a ſheet of paper upon the table, by forcing down the frame, and ſqueezing in all the edges of the paper; ſo that it lies firm and even upon the table, that thereby the plot of a field, or other incloſure, may conveniently be drawn upon it.

On both ſides this frame, near the inward edge, are ſcales of inches ſubdivided into ten equal parts, having their proper figures ſet to them. The uſes of theſe ſcales of inches are for ready drawing of parallel lines upon the paper; and alſo for ſhifting your paper, where one ſheet will not hold the whole work.

Upon one ſide of the ſaid box-frame, are projected the 360 degrees of a circle, from a braſs center-hole in the middle of the table. Each of theſe degrees are ſubdivided into thirty minutes; to every tenth degree are ſet two numbers, one expreſſing the proper numbers of degrees, and the other the complement of that number of degrees to 360. This is done to avoid the trouble of ſubtraction in taking of angles.

On the other ſide of this frame, are projected the 180 degrees of a ſemi-circle from a braſs center-hole, in the middle of the table's length, and about a fourth part of its breadth. Each of theſe degrees is ſubdivided into thirty minutes; to every tenth degree are ſet likewiſe, as on the other ſide, two numbers; one expreſſing the proper number of degrees, and the other the complement of that number of degrees to 180, for the ſame reaſon as before.

The manner of projecting the degrees on the aforeſaid frame is, by having a large circle divided into degrees, and every thirty minutes; for then placing either of the braſs center-holes on the table, in the center of that circle ſo divided, and laying a ruler from that center to the degrees on the limb of the circle; where the edge of the ruler cuts the frame, make marks for the correſpondent degrees on the frame.

The degrees, thus inſerted on the frame, are of excellent uſe in wet or ſtormy weather, when you cannot keep a ſheet of paper upon the table. Alſo, theſe degrees will make the plain-table a theodolite, or a ſemicircle, according as what ſide of the frame is uppermoſt.

There is a box, with a needle and card, covered with a glaſs, fixed to one of the long ſides of the table, by means of a ſcrew, that thereby it may be taken off. This box and needle is very uſeful for placing the inſtrument in the ſame poſition upon every remove.

There belongs to this inſtrument a braſs ſocket and ſpangle, ſcrewed with three ſcrews to the bottom of the table, into which muſt be put the head of the three-legged ſtaff, which may be ſcrewed faſt, by means of a ſcrew in the ſide of the ſocket.

There is alſo an index belonging to the table, which is a large braſs-ruler, at leaſt ſixteen inches long, and two inches broad, and ſo thick as to make it ſtrong and firm, having a ſloped edge, called the fiducial edge, and two ſights ſcrewed perpendicularly on it, of the ſame height. They muſt be ſet on the ruler perfectly at the ſame diſtance from the fiducial edge. Upon this index it is uſual to have many ſcales of equal parts, as alſo diagonals, and lines of chords.

When you would make your table fit for uſe, lay the two boards together, and alſo the ledges at the ends in their due places, according as they are marked. Then lay a ſheet of white paper all over the table, which muſt be ſtretched over the boards, by putting on the box-frame, which binds both the paper to the boards, and the boards to one another: then ſcrew the ſocket on the back ſide the table, and alſo the box and needle in its due place, the meridian line of the card lying parallel to the meridian or diameter of the table; which diameter is a right line drawn upon the table, from the beginning of the degrees through the center, and ſo to the end of the degrees. Then put the ſocket upon the head of the ſtaff, and there ſcrew it: alſo put the ſights upon the index, and lay the index on the table. So is your inſtrument prepared for uſe, as a plain table, theodolite, or ſemicircle.

1. *How to obſerve an angle in the field by the* PLAIN *Table.* —Suppoſe E, K, K, G, (*fig.* 9.) to be two hedges, or two ſides of a field, including the angle E K G, and it is required to draw upon the table an angle equal thereto: firſt, place your inſtrument as near the angular point K as conveniency will permit, turning it about, till the north end of the needle hang directly over the meridian line in the card, and then ſcrew the table faſt. Then upon your table, with your protracting-pin, which is a fine needle put into a piece of box or ivory, neatly turned, or compaſs-point, aſſign any point at pleaſure upon the table, and to that point apply the edge of the index, turning the index about upon that point, till through the ſights you ſee a mark ſet up at E, or parallel to the line E H; and then with your protracting pin, compaſs-point, or pencil, draw a line by the ſide of the index to the aſſigned-point upon the table: then, the table remaining immoveable, turn the index about upon the forementioned point, and direct the ſights to the mark ſet up at G, or parallel thereto, that is, ſo far diſtant from G, as your inſtrument is placed from K; and then by the ſide of the index draw another line to the aſſigned point. Thus will there be drawn upon the table two lines repreſenting the hedges E K and K G, and which include an angle equal to the angle E K G. And, though you know not the quantity of this angle, yet you may find it, if required: for, in working by this inſtrument, it is ſufficient only to give the proportions of angles, and not their quantities in degrees, as in working by the theodolite, ſemi-circle, or circumferentor. Alſo in working by the plain table, there needs no protraction at all, for you will have upon your table the true figure of any angle or angles that you obſerve in the field, in their true poſitions, without any further trouble.

2. *How to find a quantity of an angle in a field, by the* PLAIN *Table, conſidered as a theodolite or ſemi-circle.* —Let it firſt be required to find the quantity of the angle E K G (*fig.* 9.) by the plain table, as a theodolite. Place your inſtrument at K, with the theodolite ſide of the frame upwards, laying the index upon the diameter thereof; then turn the whole inſtrument about, the index ſtill reſting upon the diameter, till through the ſight you eſpy the mark at E: then ſcrewing the inſtrument faſt there, turn the index about upon the theodolite center-hole in the middle of the table, till through the ſights you eſpy the mark at G. Then note what degrees on the frame of the table are cut by the index, and thoſe will be the quantity of the angle E K G ſought.

You muſt proceed in the ſame manner for finding the quantity of an angle by the plain table as a ſemi circle; only put the ſemi-circle ſide of the frame upwards, and move the index upon the other center-hole.

3. *How, by the* PLAIN *Table, to take the plot of a field at one ſtation within the ſame, from whence all the angles of the ſame field may be ſeen.* — Having entered upon the field to ſurvey, your firſt work muſt be to ſet up ſome viſible mark at each angle thereof; which being done, make choice of ſome convenient place about the middle of the field, from whence all the marks may be ſeen, and there place your table, covered with a ſheet of paper, with the needle hanging directly over the meridian line of the card, which you muſt always have regard to, eſpecially when you are to ſurvey many fields together. Then make a mark about the middle of the paper, to repreſent that part of the field where the table ſtands; and, laying the index upon this point, direct your ſights to the ſeveral angles where you before placed marks, and draw lines by the ſide of the index upon the paper. Then meaſure the diſtance of every of theſe marks from your table, and by your ſcale ſet the ſame diſtances upon the lines drawn upon the table, making ſmall marks with your protracting-pin, or compaſs-point, at the end of each of them. Then lines, being drawn from the one to the other of theſe points, will

will give you the exact plot of the field; all the lines and angles upon the table being proportional to those of the field.

Example.—Suppose the plot of the field A B C D E F (*fig.* 10.) was to be taken. Having placed marks in the several angles thereof, make choice of some proper place about the middle of the field, as at L, from whence you may behold all the marks before placed in the several angles; and there place your table. Then turn your instrument about, till the needle hang over the meridian line of the card, denoted by the line N S.

Your table being thus placed with a sheet of paper thereon, make a mark about the middle of your table, which shall represent the place where your table stands. Then applying your index to this point, direct the sights to the first mark at A, and, the index resting there, draw a line by the side thereof to the point L. Then with your chain measure the distance from L, the place where your table stands, to A, the first mark, which suppose eight chains ten links. Then take eight chains ten links from any scale, and set that distance upon the line from L to A.

Then directing the sights to B, draw a line by the side of the index, as before, and measure the distance from your table at L, to the mark at B, which suppose eight chains seventy-five links. This distance taken from your scale, and applied to your table from L to B, will give the point B, representing the second mark. Then direct the sights to the third mark C, and draw a line by the side of the index, measuring the distance from L to C, which suppose ten chains sixty-five links. This distance being taken from your scale, and applied to your table from L to C, will give you the point C, representing the third mark.

In this manner you must deal with the rest of the marks at D, E, and F, and more, if the field had consisted of more sides and angles.

Lastly, when you have made observations of all the marks round the field, and found the points A B C D E and F upon your table, you must draw lines from one point to another, till you conclude where you first begun. As, draw a line from A to B, from B to C, from C to D, from D to E, from E to F, and from F to A, where you begun; then will A B C D E F be the exact figure of your field, and the line N S the meridian.

Note, Our chains are commonly four poles in length, and are divided into one hundred equal parts, called links, at every tenth of which are brass distinctions numbering them.

4. *To take the plot of a wood, park, or other large champaign plain by the* PLAIN *Table, in measuring round the same.*—Suppose A B C D E F G (*fig.* 11.) to be a large wood, whose plot you desire to take upon the plain table.

Having put a sheet of paper upon the table, place your instrument at the angle A, and direct your sights to the next angle at B, and by the side of which draw a line upon your table, as the line A B. Then measure by the hedge side from the angle A to the angle B, which suppose twelve chains five links. Then from your scale take twelve chains five links, and lay off upon your table from A to B. Then turn the index about, and direct the sights to G, and draw the line A G upon the table. But at present you need not measure the distance.

Remove your instrument from A, and set up a mark where it last stood, and place your instrument at the second angle B. Then laying the index upon the line A B, turn the whole instrument about, till through the sights you see the mark set up at A, and there screw the instrument. Then laying the index upon the point B, direct your sights to the angle C, and draw the line B C upon your table. Then measuring the distance B C four chains forty-five links, take that distance from your scale, and set it upon your table from B to C.

Remove your instrument from B, and set up a mark in the room of it, and place your instrument at C, laying the index upon the line C B; and turn the whole instrument about, till through the sights you espy the mark set up at B, and there fasten the instrument. Then laying the index on the point C, direct the sights to D, and draw upon the table the line C D. Then measure from C to D eight chains eighty-five links, and set that distance upon your table from C to D.

Remove the instrument to D, placing a mark at C, where it last stood, and lay the index upon the line D C, turning the whole instrument about, till through the sights you see the mark at C, and there fasten the instrument. Then lay the index on the point D, and direct the sights to E, and draw the line D E. Then with your chain measure the distance D E thirteen chains four links, which lay off on the table from D to E.

Remove your instrument to E, placing a mark at D, where it last stood, and, laying the index upon the line D E, turn the whole instrument about, till through the sights you see the mark at D, and there fasten the instrument. Then lay the index on the point E, and direct the sights to F, and draw the line E F. Then measure the distance E F seven chains seventy links, which take from your scale, and lay off from E to F.

Remove your instrument to F, placing a mark at E, where it last stood, and lay the index upon the line E F, turning the instrument about, till you see the mark set up at E, and there fasten the instrument. Then laying the index on the point F, direct the sights to G, and draw the line F G upon the table, which line F G will cut the line A G in the point G. Then measure the distance F G five chains sixty-seven links, and lay it off from F to G.

Remove your instrument to G, setting a mark where it last stood, and lay the index upon the line F G, turning the whole instrument about, till through the sights you see the mark at F, and there fasten the instrument. Then laying the index upon the point G, direct the sights to A, your first mark, and draw the line G A, which, if you have truly wrought, will pass directly through the point A, where you first began.

In this manner you may take the plot of any champaign plain, be it never so large. And here note, that very often hedges are of such thickness, that you cannot come near the sides or angles of the field, either to place your instrument, or measure the lines: therefore, in such cases, you must place your instrument, or measure your lines parallel to the side thereof; and then your work will be the same as if you measured the hedge itself. Note also, that in thus going about the field, you may much help yourself by the needle. For looking what degree of the card the needle cuts at one station, if you remove your instrument to the next station, and with your sights look to the mark where the instrument last stood, you will find the needle to cut the same degree again, which will give you no small satisfaction in the prosecution of your work. And though there be a hundred or more sides, the needle will still cut the same degrees at all of them, except you have committed some former error: therefore, at every station have an eye to the needle.

5. Of shifting the paper.—In taking the plot of a field by the plain table, and going about the same, as before directed, it may so fall out, if the field be very large, and when you are to take many inclosures together, that the sheet of paper upon the table will not hold all the work. But you must be forced to take off that sheet, and put another clean sheet in the room thereof: and, in plotting of a manor or lordship, many sheets may be thus changed, which we call shifting of paper. The manner of performing thereof is as follows.

Suppose in going about to take the plot A B C D E F G (*fig.* 12.) as before directed, that you having made choice of the angle at A for the place of the beginning, and proceed from thence to B, and from B to C, and from C to D, when you come to the angle at D, and are to draw D E, you want room to draw the same upon the table; do thus:

First, through the point D draw the line D O, which is almost so much of the line D E as the table will contain. Then near the edge of the table H M, draw a line parallel to H M, by means of inches and subdivisions on the opposite sides of the frame, as P Q, and another line at right angles to that through the point O, as O N. This being done, mark this sheet of paper with the figure (1) about the middle thereof, for the first sheet.

Then,

Then, taking this ſheet off your table, put another clean ſheet thereon, and draw upon it a line parallel to the contrary edge of the table, as the line R S (*fig.* 13.) Then taking your firſt ſheet of paper, lay it upon the table ſo, that the line P Q may exactly lie upon the line R S, to the beſt advantage, as at the point O. Then with the point of your compaſſes draw ſo much of the line O D upon the clean ſheet of paper as the table will hold. Having thus done, proceed with your work upon the new ſheet, beginning at the point O; and ſo going forward with your work, in all reſpects as has been before directed; as from O to E, from E to F, from F to G, and from G to A; ſhifting your paper as you have occaſion.

PLAIN *Number* is a number that may be produced by the multiplication of two numbers into one another: thus 20 is a plain number produced by the multiplication of 5 into 4.

PLAIN *Place*, *locus planus*, or *locus ad planum*, among the ancient geometricians, denoted a geometrical locus, when it was a right line or a circle, in oppoſition to a ſolid place, which was an ellipſis, parabola, or hyperbola. Theſe the moderns diſtinguiſhed into *loci ad rectam*, and *loci ad circulum*. See LOCUS.

PLAIN *Problem*, in mathematics, is ſuch a problem as cannot be ſolved geometrically, but by the interſection either of a right line and a circle, or of the circumferences of two circles; as, given the greateſt ſide, and the ſum of the other two ſides of a right angled triangle, to find the triangle, as alſo to deſcribe a trapezium that ſhall make a given area of four given lines. Such problems can only have two ſolutions, in regard a right line can only cut a circle, or one circle cut another in two points.

PLAIN, in heraldry, ſometimes denotes the point of the ſhield, when couped ſquare; a part remaining under the ſquare, of a different colour or metal from the ſhield. This has been ſometimes uſed as a mark of baſtardy, and called champaigne; for, when the legitimate deſcendants of baſtards have taken away the bar, fillet, or traverſe borne by their fathers, they are to cut the point of the ſhield with a different colour called plain.

PLAINT, in law, the exhibiting any action, real or perſonal, in writing. See ACTION.

PLAISE, the Engliſh name of a ſpecies of the pleuronectes, with ſmooth ſides, a ſpine near the anus, and the eyes and ſix tubercles placed on the right ſide of the head: it is ſomewhat larger than the flounder.

PLAISTER, or PLASTER. See the article PLASTER.

PLAN, in general, denotes the repreſentation of ſomething drawn on a plane: ſuch are maps, charts, ichnographies, &c.

The term plan, however, is particularly uſed for a draught of a building, ſuch as it appears, or is intended to appear, on the ground; ſhewing the extent, diviſion, and diſtribution of its area, or ground-plot, into apartments, rooms, paſſages, &c.

A geometrical plan is that, wherein the ſolid and vacant parts are repreſented in their natural proportions.

The raiſed plan of a building is the ſame with what is otherwiſe called an elevation or orthography.

A perſpective plan is that exhibited by degradations, or diminutions, according to the rules of perſpective. See PERSPECTIVE.

To render plans intelligible, it is uſual to diſtinguiſh the maſſives with a back waſh; the projectures on the ground are drawn in full lines, and thoſe ſuppoſed over them in dotted lines. The augmentations, or alterations, to be made, are diſtinguiſhed by a colour different from what is already built; and the tints of each plan made lighter, as the ſtories are raiſed.

In large buildings, it is uſual to have three ſeveral plans, for the three firſt ſtories.

PLANCHIER, or PLANCERE, in architecture, the under part of the corona, or drip, making the ſuperior part of the corniche, between two cymatiums.

PLANE, *Planum*, in geometry, denotes a plain ſurface, or one that lies evenly between its bounding lines: and as a right line is the ſhorteſt extenſion from one point to another, ſo a plane ſurface is the ſhorteſt extenſion from one line to another.

In aſtronomy, conics, &c. the term plane is frequently uſed for an imaginary ſurface, ſuppoſed to cut and paſs through ſolid bodies; and on this foundation, is the whole doctrine of conic ſections built.

In mechanics, planes are either horizontal, that is, parallel to the horizon, or inclined thereto.

The determining how far any given plane deviates from an horizontal one, makes the whole buſineſs of levelling.

In optics, the planes of reflection and refraction are thoſe drawn through the incident and reflected or refracted rays.

The plane of the horopter is that drawn through the horopter, perpendicularly to the plane of the two optical axes. See HOROPTER.

In perſpective, we meet with the perſpective plane, which is ſuppoſed to be pellucid, and perpendicular to the horizon; the horizon plane, ſuppoſed to paſs through the ſpectator's eye, parallel to the horizon; the geometrical plane, likewiſe parallel to the horizon, whereon the object to be repreſented is ſuppoſed to be placed, &c.

The plane of projection, in the ſtereographic projection of the ſphere, is that on which the projection is made; correſponding to the perſpective plane.

PLANE, in joinery, an edge-tool to ſhave wood ſmooth and even. It conſiſts of a wooden ſtock, very ſmooth at bottom, in the middle of which is an aperture, through which paſſes a ſteel edge very ſharp, that takes off the inequalities of the wood on which it is ſlid along.

It has various names according to its forms, ſizes, and uſes.

PLANET, *Planeta*, in aſtronomy, a celeſtial body revolving round the ſun as a center, and changing its poſition with reſpect to the fixed ſtars.

The word is formed from the Greek, πλανητης, which is derived from πλανη, wandering; becauſe they are not fixed like the other ſtars.

The planets are uſually diſtinguiſhed into primary and ſecondary.

Primary PLANETS are thoſe which move round the ſun as a center, and theſe, by way of eminence, are uſually called planets.

Secondary PLANETS, or ſatellites, are ſuch as move round ſome primary planet, as their reſpective center, in the ſame manner as the primary planets do round the ſun.

The primary planets are ſix in number, viz. Saturn, Jupiter, Mars, the Earth, Venus, and Mercury. Of theſe the firſt three are called ſuperior planets, becauſe their orbits circumſcribe that of the earth; and the two laſt inferior planets, becauſe their orbits are circumſcribed by the orbit of the earth. The order, poſition, magnitude, &c. of the planets are repreſented in plate CI. *fig.* 3.

From the ſeveral phaſes and appearances of the planets, they are found to be all perfectly like the moon, that is, opake bodies, and borrow all their light from the ſun.

This will plainly appear from the following particulars:

1. Venus, obſerved with a teleſcope, is rarely found full, but with variable phaſes like thoſe of the moon, her illuminated part ſtill turned towards the eaſt, when ſhe is the morning ſtar, and weſt, when the evening ſtar. And the like phaſes have been obſerved of Mars and Mercury.

2. Gaſſendus firſt, and after him others, have obſerved Mercury on the face of the ſun, acroſs which he appeared to paſs like a black round ſpot.—Horrox, in 1639, alſo obſerved Venus in the ſun, where ſhe made the ſame appearance.

3. De la Hire, in 1700, with a teleſcope of ſixteen feet, diſcovered mountains in Venus, larger than thoſe of the moon.

4. Caſſini obſerved two ſpots in Venus; four in Mars, likewiſe obſerved by Campani; and ſeveral, at ſeveral times, in Jupiter: and from his obſervations of theſe ſpots found that they had a rotation round their axes: he even determined the velocity of that rotation, or the period wherein it was effected, v. gr. that of Jupiter 9 hours 56′; that of Mars, 24 hours 40′; and that of Venus, 24 hours.—And ſince the ſun, moon, Jupiter, Mars, Venus, and the earth, are found to revolve on their axes, i. e. to have a diurnal rotation: no doubt Mercury and Saturn

have the ſame; though the great nearneſs of the former to the ſun, and the great diſtance of the latter, prevent any ſpots from being obſerved on them, whence that rotation might be demonſtrated.

5. In Jupiter are obſerved two ſwaths, or belts, brighter than the reſt of his diſk, and moveable; ſometimes found in one part, ſometimes in another; ſometimes broader, ſometimes narrower.

6. In 1609, were firſt obſerved three little ſtars, or moons, moving about Jupiter, by Sim. Marius; and in 1610 the ſame were obſerved by Galileo: theſe are now frequently obſerved to diſappear in a clear ſky, when Jupiter happens to be diametrically interpoſed between them and the ſun.—Whence it appears they are void of light, at ſuch time when the ſun's rays, intercepted by Jupiter, cannot be propagated to them in right lines; and hence alſo, that, like the moon, they are opake bodies, illuminated by the ſun; and hence again, ſince Jupiter does not illuminate his ſatellites when placed behind, he himſelf in that part turned from the ſun, may be argued to be void of light.

7. When Jupiter's moons are diametrically interpoſed between Jupiter and the ſun, there is ſeen a round ſpot on Jupiter's diſk, which is ſometimes larger than the ſatellite itſelf—Whence it appears, that the ſatellites are opake bodies, illuminated by the ſun; that they project a ſhadow upon the planet, and that the round ſpots ſeen in Jupiter are the ſhadows of the ſatellites. Whence alſo, the interſection of that ſhadow being found to be a circle, the ſhadow muſt be conical; and therefore the figure of the ſatellites, at leaſt as to ſenſe, is ſpherical.

8. The earth being between Jupiter and the ſun, if, at the ſame time, any of the ſatellites happen to be between Jupiter and the ſun, it is loſt in Jupiter's light, though ſometimes appearing like a black ſpot.—This phænomenon has been frequently obſerved by Caſſini and Maraldi, who have likewiſe noted very conſiderable alterations in the apparent magnitudes of the ſatellites; for which no reaſon could be given from the diſtance of Jupiter, the ſun, or the earth: e. gr. That the fourth, which is uſually ſeen the ſmalleſt, is ſometimes the largeſt, and the third, which is uſually the largeſt, ſometimes the ſmalleſt—Hence, as the ſatellites are illuminated by the ſun, even then when emerged in Jupiter's light, yet appear obſcure, there muſt be ſome alteration in their atmoſpheres, to prevent the ſun's rays being equally reflected from every part of their ſurface; which muſt likewiſe be the cauſe why their ſhadow is ſometimes larger than themſelves.

Now, to ſum up the evidence.—1. Since in Venus, Mercury, and Mars, only that part of the diſk illuminated by the ſun is found to ſhine; and, again, Venus and Mercury, when between the earth and the ſun, appear like dark ſpots or maculæ on the ſun's diſk; it is evident, that Mars, Jupiter, and Mercury, are opake bodies, illuminated with the borrowed light of the ſun. And the ſame appears of Jupiter, from its being void of light in that part to which the ſhadow of the ſatellites reaches, as well as in that part turned from the ſun; and that his ſatellites are opake, and reflect the ſun's light, is abundantly ſhewn. Wherefore, ſince Saturn, with his ring and ſatellites, only yield a faint light, fainter conſiderably than that of the fixed ſtars, though theſe be vaſtly more remote; and than that of the reſt of the planets: it is paſt doubt, he too, with his attendants, are opake bodies.

2. Since the ſun's light is not tranſmitted through Mercury and Venus, when placed againſt him, it is plain they are denſe opake bodies; which is likewiſe evident of Jupiter, from his hiding the ſatellites in his ſhadow; and therefore, by analogy, the ſame may be concluded of Saturn.

3. From the variable ſpots in Venus, Mars, and Jupiter, it is evident thoſe planets have a changeable atmoſphere; which changeable atmoſphere may, by a like argument, be inferred of the ſatellites of Jupiter, and therefore by ſimilitude the ſame may be concluded of the other planets.

4. In like manner, from the mountains obſerved in Venus, the ſame may be ſuppoſed in the other planets.

5. Since then Saturn, Jupiter, both their ſatellites, Mars, Venus, and Mercury, are opake bodies, ſhining with the ſun's borrowed light, are furniſhed with mountains, and encompaſſed with a changeable atmoſphere; they have, of conſequence, waters, ſeas, &c. as well as dry land, and are bodies like the moon, and therefore like the earth. Q. E. D.

And hence nothing hinders but that the planets may alſo be concluded to be inhabited. — Huygens, in his Coſmotheoros, argues very plauſibly for the exiſtence of planetary inhabitants, from the ſimilitude of the planets with our earth; thoſe, like this, being opake, denſe, uneven, round, heavy, illuminated and warmed by the ſun; having night and day, ſummer and winter, &c.

Wolfius deduces ſomething relating hereto from arguments of another kind.—Thus, e. gr. it is ſcarce to be doubted, that the inhabitants of Jupiter are much larger than thoſe of the earth; and, in effect, of the giant kind. For it is ſhewn in optics, that the pupil of the eye contracts in a ſtrong light, and dilates in a weak one; wherefore, ſince in Jupiter the ſun's meridian light is much feebler than on the earth, by reaſon of Jupiter's greater diſtance from the ſun; the pupil will need to be much more dilatable in the inhabitants of Jupiter, than in thoſe of the earth. But the pupil is obſerved to have a conſtant proportion to the ball of the eye, and the eye to the reſt of the body; ſo that, in animals, the larger the pupil, the larger the eye, and the larger the body.

To aſcertain the ſize of theſe jovial inhabitants, it may be obſerved, that the diſtance of Jupiter from the ſun is to the earth's diſtance from the ſame, as 26 to 5; the intenſity of the ſun's light in Jupiter is to its intenſity on the earth, in a duplicate ratio of 5 to 26; but it is found by experience, that the pupil dilates in a ratio greater than that wherein the intenſity of light decreaſes; otherwiſe, a body at a great diſtance might be ſeen as clearly as nearer: the diameter, therefore, of the pupil in its greateſt dilatation, in Jupiter, is to its diameter in the like ſtate in the earth, in a ratio greater than that of 5 to 26.—If then we put it, as 10 to 26, or as 5 to 13: ſince the ordinary ſtature of the inhabitants of the earth is computed at 5 Engliſh feet, 4 inches and $\frac{3}{16}$ (which Wolfius tells us is his own height;) the ordinary ſtature of Jupiter's inhabitants will be found 14 feet $\frac{2}{3}$, which is very nearly the ſize of the giant Og, mentioned by Moſes, whoſe iron bed was 9 cubits long, and its breadth 4.

In the Copernican ſyſtem, the proportion between the ſemi-diameters of the planetary orbits, or between the diſtances of the ſeveral planets from the ſun, is found by trigonometry; ſo that if the diſtance of any one of them, as for inſtance, if the diſtance of the earth from the ſun be given, the diſtances of all the reſt of the planets from the ſun may be found: in any of the ſuperior planets, the ratio its diſtance from the ſun bears to the diſtance of the earth from the ſun is known, by meaſuring the angle of the planet's retrogradation: thus, let S (plate CII. *fig.* 2.) be the ſun, A B C the orbit of the earth, E F G the orbit of Mars, H L M be part of a great circle in the ſphere of the heaven wherein Mars appears to go retrograde; let the place of Mars be at F; by the earth paſſing in her orbit from B to C, Mars will appear to move retrograde from M to H: the angle then of the retrogradation of Mars, namely, M F H, is known by obſervation; to this the vertical angle B F C is equal; draw S F and S B, and you have the triangle S B F, wherein the angle S B F is a right one; but the angle S F B is equal to half the angle of retrogradation, and conſequently known; ſo that, in this triangle, two angles are known, and, therefore, the remaining angle F S B may be found; and, all the angles being known, the ratio of any one ſide to any other, as the ratio of S B, the diſtance of the earth from the ſun, to S F, the diſtance of Mars from the ſun, may be found.

The angle of the retrogradation of Mars is here expreſſed as if Mars ſtood ſtill at F, whilſt the earth went from B to C; whereas Mars, in the mean time, moves forward in his orbit, from F to K, ſo that his real retrogradation will be only M L leſs than M H: but ſince the quantity of Mars's motion in his orbit may be found, during the time of his retrogradation, it may be known how

how much the angle of his retrogradation is thereby diminiſhed, and conſequently what his retrogradation would have been, if he had ſtood ſtill all the while at F.

In either of the inferior planets, the ratio of the ſemi-diameter of its orbit to the ſemi-diameter of the orbit of the earth is eaſily found by the angle of the planet's greateſt elongation: thus, let S (*fig.* 1.) be the ſun, A B C the orbit of Mercury, E F G the orbit of the earth, L M N an arch of a great circle in the ſphere of the fixed ſtars, and the place of Mercury, when ſeen at L, in his greateſt elongation from the ſun; draw S E and SA, and you have a triangle, whereof the angle S A E is a right one; S E A is the angle of Mercury's elongation, known by obſervation, and, therefore, the remaining angle A S E may be found: and, conſequently, the ratio of E S, the diſtance of the earth from the ſun, to A S, the diſtance of Mercury from the ſun, may be known.

The two paragraphs immediately preceding, ſhew how to find the comparative diſtances of the planets from the ſun, but only in a general and leſs accurate way; becauſe neither the excentricities of the planetary orbits, nor the inclinations of their planes, are there taken into the account: more exact methods may be ſeen in Gregory's Aſtronomy, book 3, prop. 19, 21, and 22; and Caſſini's Elemens d'Aſtronomie, liv. 4. chap. 6.

The diſtances of the planets from the ſun are found to be in a certain ratio to the periodical times of their revolutions round the ſun; the ſquares of their periodical times are as the cubes of their diſtances: this analogy, diſcovered by Kepler, furniſhes us with a method of finding the ratio between the diſtances of the planets from the ſun, to greater exactneſs than can be done by any other method: becauſe the periodical times of the planets are known to great exactneſs.

That the different dimenſions, revolutions, denſities, quantities of matter, light, heat, &c. of the ſix primary planets, may be ſeen at one general view, we have drawn up the following ſynopſis, from Mr. Whiſton's calculations.

A ſynopſis of divers affections of the PLANETS.

We have hitherto conſidered the phænomena of the heavenly bodies without regard to the accurate form of their orbits, which is not circular, but elliptical; yet that it is very little ſo, even in the moſt excentric orbit, as that of Mercury, will appear by comparing their excentricities with their mean diſtances from the ſun. Thus, ſuppoſe the mean diſtance of the earth from the ſun be divided into 1000 equal parts, then in thoſe parts we have,

In Mercury,	CS : DS ::	80 :	387	:: 1 :	4,84
Venus,	CS : DS ::	5 :	723	:: 1 :	144,6
Earth,	CS : DS ::	17 :	1000	:: 1 :	19
Mars,	CS : DS ::	141 :	1524	:: 1 :	10,8
Jupiter,	CS : DS ::	250 :	5201	:: 1 :	20,8
Saturn,	CS : DS ::	547 :	9538	:: 1 :	17,4

It is found by experience, that the orbits of the planets are quieſcent, or that the line of the apſides A P (plate CII. *fig.* 3) always keeps one and the ſame poſition with reſpect to the fixed ſtars: and the aphelium, or point A, poſſeſſes different points in the ecliptic in the ſeveral orbits, as in the foregoing ſynopſis.

That the earth's orbit is elliptical, is well known from common experience; for were the orbit circular, the ſun's apparent diameter would always be the ſame; but we find it is not, for if it be meaſured with a micrometer in winter-time, it will be found conſiderably larger than in the ſummer, and it will be greateſt of all when the ſun is in the 8° of ♑ (which ſhews that is the place of the aphelium) it being then 32′ 47″; whereas, when the ſun is in the 8° of ♋, his diameter is but 31′ 40″.

Hence it is evident that the ſun is really nearer to us in the midſt of winter than in the midſt of ſummer; but this ſeems a paradox to many, who think the ſun muſt needs be hotteſt when it is neareſt to us, and that the ſun is apparently more diſtant from us in December than in June. As to the ſun's being hotter, it is true, it is ſo to all thoſe places which receive his rays directly or perpendicularly, but we find his heat abated on account of the obliquity of the rays, and his ſhort continuance above the horizon at that time. And, as to his diſtance, it is only with reſpect to the zenith of the place, not the center of the earth; ſince it is plain, the ſun may approach the center of the earth, at the ſame time that it recedes from the zenith of any place.

Agreeable to the ſun's nearer diſtance in the winter, we obſerve his apparent motion is then quicker than in ſummer; for in the 8° of ♑ it is about 61′ per day, but in the 8° of ♋ his motion is but 57′ per day. Accordingly, we find the ſummer half-year 8 days longer than the winter half-year, as appears by the following computation, according to the new ſtyle.

In March	10½ days.	In September	07 days.
April	30	October	31
May	31	November	30
June	30	December	31
July	31	January	31
Auguſt	31	February	28
September	23	March	20½
	186½		178½
	178½		
The difference	8 days.		

For the ſun's attracting force being one part of the cauſe of the planet's motion, and this force always increaſing and decreaſing in the inverſe ratio of the ſquares of the diſtances, it is evident the velocity of the planet will always be greater the nearer it is to the ſun. and *vice verſa*. Hence the motion of a planet is every where unequable, being conſtantly accelerated, as it paſſes from A (*fig.* 3.) by D to P, and in the other half from P to A it is retarded.

Yet is this unequal motion of a planet regulated by a certain immutable law, from which it never varies, which is, That a line, drawn from the center of the ſun to the center of the planet, does ſo move with the planet about the ſun, that it deſcribes elliptic areas always proportional to the times; that is, if when the planet moves ſloweſt, it deſcribes the arch A *d* in a given time, and when it moves quickeſt, it deſcribes the arch *b* P in the ſame time, then will the trilineal area A S *d* be equal to the other trilineal area *b* S P.

To demonſtrate this, let the time in which the planet moves through the periphery of its orbit be divided into equal parts, and ſuppoſe that in the firſt part it deſcribed any right line A B (*fig.* 4.) by the projectile force in any direction and the centripetal force conjointly; then in the ſecond part of time it would proceed in the ſame right line to *c*, if nothing prevented; ſo that B *c* = A B, as is manifeſt from the firſt law of motion.

Draw the right lines S B, S *c*, and the triangles A B S and B *c* S will be equal, as having equal baſes A B, B *c*, and the ſame altitude of the vertex S. But when the body comes to B, let the centripetal force act with a new impulſe either equal to the former or unequal, and let it cauſe the body to decline from the right line B *c*, and deſcribe the right line B C; draw C *c* parallel to B S, meeting B C in C; and at the end of the ſecond part of time the body will be at C, and in the ſame plane with the triangle A S B. Join S C, and becauſe of the parallels S B, C *c*, the triangle S B C will be equal to the triangle S B *c*, and therefore equal to the triangle S A B. By the ſame way of reaſoning, if the centripetal force act ſucceſſively in the points C, D, E, cauſing the body in each equal part of time to deſcribe the right lines C D, D E, E F, &c. the triangles S C D, S D E, S E F, &c. will be equal, and all in the ſame plane.

In equal times, therefore, equal area's are deſcribed; and, by compoſition of ratio's, any ſums of area's S A D S, S A F S, are to each other as the times in which they are deſcribed. Let now the number of triangles be increaſed, and their breadth be diminiſhed in infinitum; then will their perimeter A D F be ultimately a curve: and, therefore, the centripetal force, by which the body is drawn perpetually from the tangent to this curve, acts inceſſantly; and the area's deſcribed are alſo in this caſe proportional to the times of their deſcription. Hence the velocity of the revolving body or planet is every where inverſely, as the perpendicular let fall from the center S to the tangent of the orbit in the place of the planet. For the velocities in the points, A, B, C, &c. are the baſes of the triangles A B, B C, C D, &c. as being the ſpaces deſcribed in the ſame time; and the baſes of equal triangles are reciprocally as their perpendicular altitudes; and, therefore, ſince in the evaneſcent triangles A S B, and A S C, &c. the right lines A *c*, B *d*, C *e*, &c. become tangents to the curve in the points A, B, C, &c. it is manifeſt, the velocity in thoſe points will be inverſely, as a perpendicular from S let fall upon thoſe tangent lines produced.

Hence alſo it follows, that the times in which equal arches are deſcribed in any planetary orbit, are directly as thoſe perpendiculars, becauſe they are inverſely as the velocities.

PLANETARIUM, an aſtronomical machine, ſo called from its repreſenting the motions, orbits, &c. of the planets, agreeably to the Copernican ſyſtem.

The planetarium is more generally known by the name orrery, and therefore we have given its deſcription and uſe under that article. See ORRERY.

PLANETARY, ſomething relating to the planets.

Thus we meet with planetary days, hours, years, ſyſtems, &c.

PLANIMETRY, that part of geometry which conſiders lines and plain figures, without conſidering their height or depth.

PLANISPHERE ſignifies a projection of the ſphere and its various circles on a plane; in which ſenſe maps, wherein are exhibited the meridians, and other circles of the ſphere, are planiſpheres.

PLANISPHERE is more particularly uſed for an aſtronomical inſtrument uſed in obſerving the motions of the heavenly bodies.

It conſiſts of a projection of the celeſtial ſphere upon a plane, repreſenting the ſtars, conſtellations, &c. in their proper order; ſome being projected on the meridian, and others on the equator.

Among all theſe planiſpheres, that of M. Caſſini ſeems to deſerve the preference; it is compoſed of two circular, but unequal plates, A and B (plate CII. *fig.* 5.) whereof the leaſt, B, is ſo fitted within the other, as to turn round

upon the center, whilſt the larger circle, A, remains immoveable. On the leſſer plate are delineated the conſtellations of the northern hemiſphere, with its ſeveral circles. The limb of the inferior plate, A, is divided into three hundred and ſixty degrees, and into twenty-four hours, which are reckoned from twelve to twelve, and each hour into ſixty minutes. Between the two oppoſite hours, twelve and twelve, is extended a ſilver-thread, which paſſing over the center, or northern pole, repreſents the meridian. If then the ſouth point be turned towards the obſerver, the ſemi-circle towards the left hand will be the eaſt, and that on the right the weſt; and the hours on the former will be thoſe of the fore-noon, and the hours on the latter thoſe of the afternoon.

Uſe of the PLANISPHERE. 1. To repreſent the face of the heavens for any day and hour: find, on the leſſer moveable plate, the month and day propoſed, and turn the plate till the given day of the month ſtand againſt the hour and minute required; and the plate will then repreſent the face of the heavens, by ſhewing what ſtars are then riſing in the meridian, or what ſetting. 2. To know at what hour and minute any ſtar riſes or ſets, &c. Turn the moveable plate, till the given ſtar reaches the horizon, eaſt or weſt, and againſt the given day, on the moveable plate, is the hour and minute on the exterior or immoveable one: and in the ſame manner may moſt of the problems uſually reſolved by the celeſtial globe, be determined.

PLANT, *planta*, is defined to be an organical body, deſtitute of ſenſe and ſpontaneous motion, adhering to another body in ſuch a manner as to draw from it its nouriſhment, and having power of propagating itſelf by ſeeds.

As to the parts of which a plant conſiſts, they are the root, ſtalk, leaf, flower, and fruit.

Plant and vegetable are pretty near terms ſynonymous, every plant being a vegetable. Dr. Boerhaave defines a vegetable to be a body generated of the earth, or ſomething ariſing of the earth, to which it adheres or is connected by parts called roots, thro' which it receives the matter of its nouriſhment and increaſe; and conſiſts of juices and veſſels ſenſibly diſtinct from each other: or, a vegetable is an organical body, compoſed of veſſels and juices every where diſtinguiſhable from each other; to which body grow roots or parts, whereto it adheres, and from which it derives the matter of its life and growth.

This definition furniſhes a juſt and adequate idea of a vegetable; for by its conſiſting of diſtinct veſſels and juices, it is diſtinguiſhed from a foſſil; and by its adhering to another body, from which it derives its nouriſhment, and being deſtitute of ſenſation, it is ſufficiently diſtinguiſhed from an animal.

The veſſels, or containing parts of plants, conſiſt chiefly of earth, bound or connected together by oil, as a gluten: which being exhauſted by fire, air, age, or the like, the plant moulders, or returns again into its earth or duſt: but it muſt be owned, that water, air, ſalt, and ſulphur or oil, are likewiſe conſtituent parts of plants, ſince they can be all obtained by a well managed analyſis.

The root, or part whereby plants are connected to their matrix, and by which they receive their nutritious juice, conſiſts of an infinite number of abſorbent veſſels, which being diſperſed thro' the interſtices of the earth, attract or imbibe the juices of the ſame; conſequently, every thing in the earth that is diſſoluble in water, is liable to be imbibed, as air, ſalt, oil, and fumes of minerals, metals, &c. and of theſe plants do really conſiſt. See ROOT.

The motion of theſe nutritious juices is not unlike that of the blood in animals, being effected by the action of the air. The diſcovery of this we owe to the admirable Malpighi, who firſt obſerved, that plants conſiſt of two ſeries or orders of veſſels: 1. Such as receive and diſtribute the alimentary juices, anſwering to the arteries, lacteals, veins, &c. of animals. 2. The tracheæ, or air-veſſels, which are long hollow pipes, wherein air is commonly received and expelled; that is, inſpired and expired. Hence it follows, that the heat of the ſun muſt have a ſtrong effect on the air included in theſe tracheæ; whence ariſes a perpetual ſpring of action, to promote the circulation of the juices in plants.

For the botanical diſtribution of plants into claſſes, genera, &c. ſee the articles BOTANY, GENUS, &c.

Foſſile PLANTS, thoſe found buried in the earth, and lodged in almoſt all the kinds of ſtrata, or ſubſtances, to be met with there.

PLANTA, in anatomy, the ſole of the foot. See FOOT.

PLANTAIN, *Plantago*, in botany, a plant the flower whereof conſiſts of one petal, uſually wide expanded at the mouth, and with the limb divided into four oval ſegments: the fruit is a bilocular capſule, of an ovated figure, containing a great many oblong ſeeds.

The root, leaves, and ſeeds of plantain are uſed in medicine, and reckoned cooling and aſtringent; being much recommended in fluxes of all kinds, particularly hæmorrhages, whether from the noſe, mouth, or uterus. It is likewiſe accounted a great healer of freſh wounds.

Ribwort, and bucks-horn plantain, are two ſpecies of, and agree with, plantain in virtues.

PLANTATION, in the Weſt-Indies, denotes a ſpot of ground which a planter or perſon, arrived in a new colony, pitches on to cultivate for his own uſe, or is aſſigned for that purpoſe. However, the term plantation is often uſed in a ſynonymous ſenſe with colony.

PLANTING, in agriculture and gardening, is ſetting a tree or plant taken from its proper place, in a new hole or pit: throwing freſh earth over its root, and filling up the hole to the level of the ſurface of the ground.

The firſt thing in planting is to prepare the ground before the trees or plants are taken out of the earth, that they may remain out of the ground, as ſhort a time as poſſible, and the next is to take up the trees or plants in order to their being tranſplanted. In taking up the trees, carefully dig away the earth round the roots, ſo as to come at their ſeveral parts to cut them off; for if they are torn out of the ground without care, the roots will be broken and bruiſed, to the great injury of the trees. When you have taken them up, the next thing is to prepare them for planting by pruning the roots and heads. And firſt, as to the roots; all the ſmall fibres are to be cut off, as near to the place from whence they are produced, as may be, except they are to be replanted immediately after they are taken up. Then prune off all the bruiſed or broken roots, all ſuch as are irregular, and croſs each other, and all downright roots, eſpecially in fruit trees: ſhorten the larger roots in proportion to the age, the ſtrength, and nature of the tree, obſerving that the walnut, mulberry, and ſome other tender-rooted kinds, ſhould not be pruned ſo cloſe as the more hardy ſorts of fruit and foreſt trees: in young fruit trees, ſuch as pears, apples, plums, peaches, &c. that are one year old from the time of their budding or grafting, the roots may be left only about eight or nine inches long; but in older trees they muſt be left of a much greater length; but this is only to be underſtood of the larger roots; for the ſmall ones muſt be chiefly quite cut out, or pruned very ſhort. The next thing is the pruning of their heads, which muſt be differently performed in different times; and the deſign of the trees muſt alſo be conſidered: thus, if they are deſigned for walls, or eſpaliers, it is beſt to plant them with the greateſt part of their heads, which ſhould remain on till they begin to ſhoot in the ſpring, when they muſt be cut down to five or ſix eyes, at the ſame time taking care not to diſturb the roots. But if the trees are deſigned for ſtandards, you ſhould prune off all the ſmall branches cloſe to the place where they are produced, as alſo the irregular ones, which croſs each other; and, after having diſplaced theſe branches, you ſhould alſo cut off all ſuch parts of branches as have by any accident been broken or wounded; but by no means cut off the main leading ſhoots, which are neceſſary to attract the ſap from the root, and thereby promote the growth of the tree.

Having thus prepared the trees for planting, you muſt now proceed to place them in the earth; but firſt, if the trees have been long out of the ground, ſo that the fibres of the roots are dried, place them eight or ten hours in water, before they are planted, with their heads erect, and the roots only immerſed therein, which will ſwell the dried veſſels of the roots, and prepare them to imbibe nouriſhment from the earth. In planting them, great regard ſhould be had to the nature of the ſoil; for if that be

be cold and moiſt, the trees ſhould be planted very ſhallow; and if it be a hard rock or gravel, it will be better to raiſe a hill of earth where each tree is to be planted, than to dig into the rock or gravel, and fill it up with earth, as is too often practiſed, by which means the trees are planted, as it were, in a tub, and have but little room to extend their roots. The next thing to be obſerved is to place the trees in the hole in ſuch a manner that the roots may be about the ſame depth in the ground as before they were taken up: then break the earth fine with a ſpade, and ſcatter it into the hole, ſo that it may fall in between every root, that there may be no hollowneſs in the earth; then, having filled up the hole, gently tread down the earth with your feet, but do not make it too hard, which is a great fault, eſpecially if the ground be ſtrong or wet. Having thus planted the trees, they ſhould be faſtened to ſtakes driven into the ground, to prevent their being diſplaced by the wind, and ſome mulch laid about the ſurface of the ground about their roots: as to ſuch as are planted againſt walls, their roots ſhould be placed about five or ſix inches from the wall, to which their heads ſhould be nailed to prevent their being blown up by the wind. The ſeaſons for planting are various, according to the different ſorts of trees, or the ſoil in which they are planted: for the trees whoſe leaves fall off in winter, the beſt time is the beginning of October, provided the ſoil be dry; but if it be a very wet ſoil, it is better to defer it till the latter end of February, or the beginning of March; and for many kinds of evergreens, the beginning of April is by far the beſt ſeaſon; though they may be ſafely removed at Midſummer, provided they are not to be carried very far; but you ſhould always make choice of a cloudy wet ſeaſon. *Miller's Gard. Dict.*

For other obſervations on planting, ſee the articles NURSERY, KITCHEN-GARDEN, ORCHARD, GROVE, &c.

Reverſe PLANTING, a method of planting in which the natural poſition of the plant or ſhoot is inverted; the branches being ſet into the earth, and the root reared into the air. Dr. Agricola mentions this monſtrous method of planting, which he found to ſucceed very well in moſt or all ſorts of fruit-trees, timber-trees, &c. Bradley affirms that he has ſeen a lime-tree in Holland growing with its firſt roots in the air, which had ſhot out branches in great plenty, at the ſame time that its firſt branches produced roots and fed the tree. Mr. Fairchild, of Hoxton, has practiſed the ſame with us, and gives the following directions for performing it: Make choice of a young tree of one ſhoot, of alder, elm, willow, or any other tree that eaſily takes root by laying; bend the ſhoot gently down into the earth, and ſo let it remain till it has taken root. Then dig about the firſt root, and raiſe it gently out of the ground, till the ſtem be nearly upright, and ſtake it up. Then prune the roots, now erected in the air, from the bruiſes and wounds they received in being dug up, and anoint the pruned parts with a compoſition of two ounces of turpentine, four ounces of tallow, and four ounces of bees wax melted together and applied pretty warm. Afterwards prune off all the buds or ſhoots that are upon the ſtem, and dreſs the wounds with the ſame compoſition, to prevent any collateral ſhootings, that might ſpoil the beauty of the ſtem.

PLANTING, in architecture, the laying the firſt courſe of ſtones, in the foundation of buildings. See FOUNDATION.

PLASHING *of Quickſet-Hedges*, an operation very neceſſary to promote the growth and continuance of old hedges.

It is performed in this manner: the old ſtubs muſt be cut off, &c. within two or three inches of the ground, and the beſt and longeſt of the middle-ſized ſhoots muſt be left to lay down. Some of the ſtrongeſt of theſe muſt alſo be left to anſwer the purpoſe of ſtakes. Theſe are to be cut off to the height at which the hedge is intended to be left; and they are to ſtand at ten foot diſtance one from another: when there are not proper ſhoots for theſe at the due diſtances, their places muſt be ſupplied with common ſtakes of dead wood. The hedge is to be firſt thinned, by cutting away all but thoſe ſhoots which are intended to be uſed either as ſtakes, or the other work of the plaſhing: the ditch is to be cleaned out with the ſpade: and it muſt be now dug as at firſt, with ſloping ſides each way; and when there is any cavity on the bank on which the hedge grows, or the earth has been waſhed away from the roots of the ſhrubs, it is to be made good by facing it, as they expreſs it, with the mould dug from the upper part of the ditch; all the reſt of the earth dug out of the ditch is to be laid upon the top of the bank, and the owner ſhould look carefully into it that this be done; for the workmen, to ſpare themſelves trouble, are apt to throw as much as they can upon the face of the bank; which being by this means overloaded, is ſoon waſhed off into the ditch again, and a very great part of the work undone; whereas what is laid on the top of the bank always remains there, and makes a good fence of an indifferent hedge.

In the plaſhing the quick, two extremes are to be avoided; theſe are, the laying it too low, and the laying it too thick: this makes the ſap run all into the ſhoots, and leaves the plaſhes without ſufficient nouriſhment; which, with the thickneſs of the hedge, finally kills them. The other extreme of laying them too high is equally to be avoided; for this carries up all the nouriſhment into the plaſhes, and ſo makes the ſhoots ſmall and weak at the bottom, and, conſequently, the hedge thin. This is a common error in the north of England. The beſt hedges made any where in England, are thoſe in Hertfordſhire; for they are plaſhed in a middle way between the two extremes, and the cattle are by that prevented both from cropping the young ſhoots, and from going through; and a new and vigorous hedge ſoon forms itſelf. When the ſhoot is bent down that is intended to be plaſhed, it muſt be cut half way through with the bill: the cut muſt be given ſloping, ſomewhat downwards, and then it is to be wound about the ſtakes, and after this its ſuperfluous branches are to be cut off, as they ſtand out at the ſides of the hedge. If for the firſt year or two the field where a new hedge is made can be ploughed, it will thrive the better for it; but if the ſtubs are very old, it is beſt to cut them quite down, and to ſecure them with good dead hedges on both ſides, till the ſhoots are grown up from them ſtrong enough to plaſh; and wherever void ſpaces are ſeen, new ſets are to be planted to fill them up. A new hedge raiſed from ſets in the common way, generally requires plaſhing about eight or nine years after.

PLASTER, *Emplaſtrum*, in pharmacy, is defined to be an external application, of a harder conſiſtence than our ointments: theſe are to be ſpread according to the different circumſtances of the wound, place, or patient, either upon linnen or leather.

PLASTER, among builders, &c. The plaſter of Paris is a preparation of ſeveral ſpecies of gypſums, dug near Mont Maitre, a village in the neighbourhood of Paris; whence the name. See GYPSUM.

The beſt ſort is hard, white, ſhining, and marbly; known by the names of plaſter-ſtone, or parget of Mont Maitre. It will neither give fire with ſteel, nor ferment with aqua-fortis, but very freely and readily calcines in the fire, into a very fine plaſter; the uſe of which in building, and caſting ſtatues, is well known. See the article STUCCO.

As the modern taſte runs greatly into plaſtering, it were to be wiſhed that this art could be brought to its ancient perfection. The plaſters of the Romans were exceeding durable; witneſs ſeveral yards of it ſtill to be found on the top of the Pont de Garde, near Niſmes. At Venice they uſe a very durable plaſter; but as the ſecret of preparing it, is not known among us, it would be worth while to try whether ſuch a ſubſtance might not be made by boiling the powder of gypſum dry over the fire, for it will boil in the manner of water; and when this boiling or recalcining was over, the mixing with it reſin, or pitch, or both together, with common ſulphur, and the powder of ſea-ſhells. If theſe were all mixed together, and the water added to it hot, and the matter all kept hot upon the fire till the inſtant of its being uſed, ſo that it might be laid on hot, it is poſſible this ſecret might be hit upon.

Wax and oil of turpentine may be alſo tried as additions; theſe being the common ingredients in ſuch cements as we have accounts of are the firmeſt. Strong

ale-wort is by ſome directed to be uſed, inſtead of water, to make mortar of lime-ſtone be of a more than ordinary ſtrength. It is poſſible that the uſe of this tenacious liquor in the powdered ingredients of this propoſed plaſter, might greatly add to their ſolidity and firmneſs.

PLASTIC, πλαστικ⊙, denotes a thing endued with a formative power, or a faculty of forming or faſhioning a maſs of matter, after the likeneſs of a living being; ſuch a virtue as ſome of the ancient Epicureans, and perhaps the Peripatetics too, imagined to reſide in the earth, or, at leaſt, to have anciently reſided therein, by means whereof, and without any extraordinary intervention of a creator, it put forth plants, &c. Some of them ſeem to be of opinion, that animals, and even man himſelf, was the effect of this plaſtic power.

PLASTICE, the PLASTIC ART, a branch of ſculpture, being the art of forming figures of men, birds, beaſts, fiſhes, &c. in plaſter, clay, ſtuc, or the like.

PLAT, among ſeamen, a ſort of flat cordage faſtened about the cables to prevent them from fretting in the hawſe.

PLAT-VEINS, in the manege, the veins wherein we bleed horſes, one in the lower part of each ſhoulder, and the other in the flat part of the thighs.

PLAT-BAND *of a Door or Window*, in architecture, denotes the lintel where it is made ſquare, or not much arched. It is uſually croſſed with iron bars, when they have a great bearing; but it is much better to eaſe them by arches of diſcharge built over them.

PLAT-BANDS *of Flutings* are the liſts or fillets between the flutings of columns.

PLATE, in commerce, ſignifies gold or ſilver wrought into veſſels, for domeſtic uſes.

PLATE, in heraldry, is a round flat piece of ſilver, without any impreſſion; but as it were formed, ready to receive it.

PLATES, in gunnery. The priſe-plates are two plates of iron on the cheeks of a gun-carriage, from the cape-ſquare to the center, through which the priſe-bolts go, and on which the handſpike reſts when it poiſes up the breech of the piece. Breaſt-plates are the two plates on the face of the carriage, one on each cheek. Train-plates are the two plates on the cheeks at the train of the carriage. Dulidge-plates are the ſix plates on the wheel of a gun-carriage, where the felloes are joined together, and ſerve to ſtrengthen the dulidges.

PLATFORM, in the military art, an elevation of earth, on which cannon is placed, to fire on the enemy; ſuch are the mounts in the middle of curtins. On the rampart there is always a platform, where the cannon are mounted. It is made by the heaping up of earth on the rampart, or by an arrangement of madriers, riſing inſenſibly, for the cannon to roll on, either in a caſemate, or on attack in the out-works.

All practitioners are agreed, that no ſhot can be depended on, unleſs the piece can be placed on a ſolid platform; for if the platform ſhakes with the firſt impulſe of the powder, the piece muſt likewiſe ſhake, which will alter its direction, and render the ſhot uncertain.

PLATFORM, in architecture, is a row of beams, which ſupport the timber-work of a roof, and lie on the top of the wall, where the entablature ought to be raiſed. This term is alſo uſed for a kind of terrace, or broad, ſmooth, open walk at the top of a building, from whence a fair proſpect may be taken of the adjacent country. Hence an edifice is ſaid to be covered with a platform, when it is flat at top, and has no ridge. Moſt of the Oriental buildings are thus covered, as were all thoſe of the ancients.

PLATONIC, ſomething that relates to Plato, his ſchool-philoſophy, opinions, or the like; thus, Platonic love denotes a pure ſpiritual affection. for which Plato was a great advocate, ſubſiſting between the different ſexes, abſtracted from all carnal appetites, and regarding no other object but the mind and its beauties: or it is even a ſincere diſintereſted friendſhip ſubſiſting between perſons of the ſame ſex, abſtracted from any ſelfiſh views, and regarding no other object than the perſon, if any ſuch love or friendſhip has aught of a foundation in nature.

PLATONIC YEAR, or the GREAT YEAR, is a period of time determined by the revolution of the equinoxes, or the ſpace wherein the ſtars and conſtellations return to their former places, in reſpect of the equinoxes. The Platonic year, according to Tycho Brahe, is 25816, according to Ricciolus 25920, and according to Caſſini 24800 years. See the article PRECESSION *of the Equinoxes*.

This period once accompliſhed, it was an opinion among the ancients, that the world was to begin anew, and the ſame ſeries of things to turn over again.

PLATONISM, the doctrine and ſentiments of Plato and his followers, with regard to philoſophy, &c.

PLATTOON, or PLOTTOON, in the military art, a ſmall ſquare body of forty or fifty men, drawn out of a battalion of foot, and placed between the ſquadrons of horſe, to ſuſtain them; or in ambuſcades, ſtreights, and defiles, where there is not room for whole battalions or regiments. Plattoons are always uſed when they form the hollow ſquare, to ſtrengthen the angles. The grenadiers are generally poſted in plattoons.

PLEA, in law, is what either party alledges for himſelf in court, in a cauſe there depending; and, in a more reſtrained ſenſe, it is the defendant's anſwer to the plaintiff's declaration.

Pleas are uſually divided into thoſe of the crown, and common pleas. Pleas of the crown are all ſuits in the king's name, or in the name of the attorney-general on his behalf, for offences committed againſt his crown and dignity, and againſt his peace; as treaſon, murder, felony, &c. Common pleas are ſuch ſuits as are carried on between common perſons, in civil caſes. Theſe pleas may be divided into as many branches as there are actions. To an action there is either a general or a ſpecial plea: and here, a general plea is a general anſwer to the declaration; as in a debt or contract, the general plea is, that he owes nothing; in a debt upon bond, that it is not his deed, or he paid it on the day; in an action on a promiſe, that he made no promiſe; and in a treſpaſs, not guilty. Special pleas are either in bar to the action brought, or in abatement of the writ on which the action is framed. All pleas are to be ſuccinct, without any unneceſſary repetitions, and muſt be direct and pertinent to the caſe.

PLEADING, in law, a ſpeech uttered at the bar, in defence of a cauſe: but, in a ſtricter ſenſe, pleadings are all the allegations of the parties to a ſuit, made after the declaration, till the iſſue is joined. In this ſenſe they expreſs what is contained in the bar, replication, and rejoinder; and not what is in the declaration itſelf. Hence defaults in the matter of declaration are not confined within the miſpleading.

From the Conqueſt all pleading was performed in French, till the reign of Edward III. when it was appointed that the pleas ſhould be pleaded in Engliſh; but that they ſhould be entered or recorded in Latin. At Athens, and even in France and England, formal and prepared pleadings were prohibited, and it was unlawful to amuſe the court with long artful harangues; only it was the ſettled cuſtom here, in important matters, to begin the pleadings with a text out of the Holy Scriptures. It is but of late years that eloquence was admitted to the bar.

PLEASURE and Pain, ſays Mr. Locke, are ſimple ideas, which we receive both from ſenſation and reflection; there being thoughts of the mind, as well as ſenſation, accompanied with pleaſure or pain. See the article PAIN.

There are a great many modes of pleaſure and pain, which reſult from the various conſiderations of good and evil, whether natural or moral, and the paſſions thereby excited. See the articles GOOD, EVIL, and PASSIONS.

Pleaſure and pain ſeem to be the means made uſe of, by nature, to direct us in the purſuit of happineſs; ſince pleaſure is annexed to whatever contributes thereto, and pain is the companion of what tends to our ruin. Hence it is, that the pleaſures of a child, a youth, a grown perſon, and an old man, all vary, according to the different things required by nature in each ſtate, whether ſimply

for

for the preſervation of the individual, or for that and propagation jointly.

PLEBEIAN, *Plebeius*, any perſon of the rank of the common people. It is chiefly uſed in ſpeaking of the ancient Romans, who were divided into ſenators, knights, and plebeians or commons.

PLEBISCITUM, in Roman antiquity, a law enacted by the common people, at the requeſt of the tribune, or other plebeian magiſtrate, without the intervention of the ſenate; but more particularly denotes the law which the people made, when they retired to the Aventine mount.

PLEDGE, *Plegius*, in common law, a ſurety, either real or perſonal, which the plaintiff is to find, for proſecuting the ſuit.

PLEDGERY, or PLEGGERY, ſuretiſhip, or an anſwering for another perſon.

PLEDGET, BOLSTER, or COMPRESS, *Plumaceolus*, in ſurgery, a kind of flat tent, laid over a wound to imbibe the ſuperfluous humours, and keep it clean. See WOUND.

PLEIADES, *Virgiliæ*, in aſtronomy, an aſſemblage of ſeven ſtars in the neck of the conſtellation Taurus. See CONSTELLATION and TAURUS.

The word is formed from the Greek πλεω, to ſail, as being terrible to mariners, by reaſon of the rains and ſtorms that frequently riſe with them.

PLENARTY, in law, is when a church benefice is full of an incumbent.

PLENARY, ſomething complete or full.

PLENILUNIUM, in aſtronomy, that phaſis of the moon commonly called the full moon. See the article MOON.

PLENIPOTENTIARY, a perſon veſted with full power to do any thing. See AMBASSADOR.

PLENITUDE, *Plenitudo*, the quality of a thing that is full, or fills another.

In medicine it chiefly denotes a redundancy of blood and humours. See PLETHORA.

PLENUM, in phyſics, denotes, according to the Carteſians, that ſtate of things, wherein every part of ſpace is ſuppoſed to be full of matter; in oppoſition to a vacuum. See VACUUM.

PLEONASM, *Pleonaſmus*, *Redundantia*, a figure in rhetoric, whereby we uſe words ſeemingly ſuperfluous, in order to expreſs a thought with the greater energy; ſuch as, "I ſaw it with my own eyes, &c."

PLEROTICS, *Plerotica*, in medicine, a kind of remedies that are healing, or that fill up the fleſh: otherwiſe called incarnatives and ſarcotics. See the article SARCOTICS.

PLETHORA, in medicine, a greater redundance of laudable blood and humours than is capable of undergoing thoſe changes which muſt neceſſarily happen for the purpoſes of life, without inducing diſeaſes.

A plethora is cured by veneſection, exerciſe, watchings, a ſharp and acrid diet, after due evacuations, and by a gradual omiſſion of theſe evacuations.

PLETHORIC, *Plethoricus*, a perſon abounding with blood, or labouring under a plethora.

PLEURA, in anatomy, a ſmooth, robuſt, and tenſe membrane, adhering to the ribs and to the intercoſtal muſcles, and ſurrounding the whole cavity of the thorax. Its ſtructure reſembles two ſacks, one of which ſurrounds one ſide of the thorax, and the other the other ſide; and each of them contains one of the two lobes of the lungs: from the conjunction of theſe two ſacculi of the pleura, in the middle of the thorax, is formed the mediaſtinum.

The uſe of the pleura is to lubricate and ſtrengthen the whole cavity of the thorax.

PLEURISY, πλευρίτις, in medicine, a violent pain in the ſide, attended with an acute fever, a cough, and a difficulty of breathing.

This diſorder affects all the parts of the internal integuments of the thorax, the whole of the pleura, and the whole of the mediaſtinum; and therefore, when it is ſeated in the membrane internally lining the ribs, it is called a true or internal pleuriſy; but when it chiefly occupies the external parts, and only the intercoſtal muſcles, and thoſe above them, are affected, it is called a ſpurious or baſtard-pleuriſy.

The pleuriſy is moſt predominant between the ſpring and ſummer. It begins with chilneſs and ſhivering, which are ſoon ſucceeded by heat, thirſt, inquietude, and the other common ſymptoms of a fever. After a few hours the patient is ſeized with a violent pricking pain in one of his ſides, about the ribs, which ſometimes extends itſelf towards the ſhoulder-blades, ſometimes towards the back-bone, and ſometimes towards the fore-parts of the breaſt, and this is attended with frequent coughing. The matter which the patient ſpits is at firſt little and thin, and mixed with particles of blood; but as the diſeaſe advances, it is more plentiful and more concocted, but not without a mixture of blood. The pulſe is remarkably ſtrong, and ſeems to vibrate like a tenſe ſtring of a muſical inſtrument; and the blood drawn from a vein, as ſoon as it is cold, looks like melted ſuet. As to the ſpitting, it is frequently abſent; and hence pleuriſies are diſtinguiſhed into moiſt and dry.

As in all inflammatory fevers, ſo in this, too hot a regimen is to be ſhunned, both with reſpect to the bed-cloaths and the heat of the room; nor muſt the patient be expoſed to the cold air, nor drink things actually cold. Hoffman obſerves, that all ſtrong ſudorifics and cathartics are hurtful; and that if the patient has three or four ſtools, the courſe of nature muſt not be ſtopped. The diet ſhould be cooling, relaxing, ſlender, and diluting. Moiſtening things taken warm, are preferable to all others; and hence barley or oatmeal-gruel, ſweetened with honey, and alſo ſweet whey, are proper. If the phyſician is called before the third day, Boerhaave directs a large quantity of blood to be let, from a wide orifice in a large veſſel, and to fetch deep ſighs, or cough, to promote its celerity; and the part affected ſhould be rubbed gently at the ſame time, and the bleeding continued till the pain remits, or the patient is ready to faint. This ſhould be repeated as often as the ſymptoms return, which it was intended to remove, and till the abſence of the white inflammatory pellicle from the ſurface of the blood when cold, ſhews it is time to leave it off. This Huxham confirms by his own experience, and adds, that after the fourth day, bleeding is not ſafe; he likewiſe recommends fomenting the part, which often eaſes the pain, and terminates the diſeaſe: but if it is obſtinate, he recommends ſlight ſcarifications, then cupping, and afterwards a bliſter on the ſame place; which has been ſucceſsful, when the uſual methods failed. The patient's body ſhould be kept open, for which purpoſe emollient clyſters are proper; and he ſhould, at the ſame time, take large quantities of ſtrong, diluting, aperient, and antiſeptic liquors: for this purpoſe, take the leaves of ſcordium, jack-by-the-hedge, and white horehound, each two ounces: boil them in two pints of water, with which mix of the oxymel of ſquills, eight ounces; of nitre, three drams; and of treacle-vinegar, one ounce: of this mixture let the patient, every quarter of an hour, take two ounces, as warm as poſſible.

Dr. Mead obſerves, on the treatment of this diſorder, that after drawing as much blood as is neceſſary, draughts with freſh-drawn linſeed-oil, are of great ſervice for eaſing the cough; nitre, for allaying the heat; and for diſſolving the ſizy blood that obſtructs the ſmall canals, wild goat's blood and volatile ſalts; and, laſtly, a bliſter laid on the part affected, in order to draw forth the peccant humour.

A purulent abſceſs or empyema is ſometimes formed in this diſeaſe; for the treatment of which, ſee EMPYEMA.

As to the baſtard-pleuriſy, Hoffman ſays, that it is properly a kind of rheumatiſm, and does not require bleeding unleſs the patient is plethoric, but a diaphoreſis and a more free perſpiration. Lanciſi, however, adviſes plentiful bleeding in the arm, ſcarifying the part affected, and cupping: and during the cure, it is neceſſary to keep the body open, and the bowels free from ſpaſms; for which purpoſes, emollient clyſters are proper, with oil of ſweet almonds.

PLEUROPNEUMONY, in medicine, a diſeaſe partaking of the nature both of a pleuriſy and peripneu-

mony. See the articles PLEURISY and PERIPNEUMONY.

PLEXUS, among anatomiſts, a bundle of ſmall veſſels interwoven in the form of net-work: thus a congeries of veſſels within the brain is called plexus choroides, reticularis, or retiformis. See the article *Plexus* CHOROIDES.

A plexus of nerves is an union of two or more nerves, forming a ſort of ganglion or knot.

PLICA POLONICA, in medicine, a diſeaſe of the hair, almoſt peculiar to Poland and Lithuania, and hence denominated Polonica. It conſiſts of a preternatural bulk of the hair, which being firmly conglutinated and wrapped up in inextricable knots, and extended to a monſtrous length, affords a very unſeemly ſpectacle. When theſe are cut off, the blood is diſcharged from them, the head racked with pain, the ſight impaired, and the patient's life frequently endangered.

PLICATED, ſomething folded together, one part over another; as the leaves of certain plants, &c.

PLINTH, ORLE, or ORLO, in architecture, a flat ſquare member, in the form of a brick.

It is uſed as the foundation of columns, being that flat ſquare table, under the moulding of the baſe and pedeſtal, at the bottom of the whole order. It ſeems to have been originally intended to keep the bottom of the original wooden pillars from rotting.

Vitruvius alſo calls the Tuſcan abacus, plinth.

PLINTH *of a Statue*, &c. is a baſe, either flat, round, or ſquare, that ſerves to ſupport it.

PLINTH *of a Wall*, denotes two or three rows of bricks advancing out from a wall; or, in general, any flat high moulding, that ſerves in a front wall to mark the floors, to ſuſtain the eaves of a wall, or the larmier of a chimney.

PLOT, in dramatic poetry, is ſometimes uſed for the fable of a tragedy or comedy, but more particularly the knot or intrigue, which makes the embarras of any piece. The unravelling puts an end to the plot.

PLOT, in ſurveying, the plan or draught of any field, farm, or manor, ſurveyed with an inſtrument, and laid down in the proper figure and dimenſions.

PLOTTING, among ſurveyors, is the art of laying down on paper, &c. the ſeveral angles and lines of a tract of ground ſurveyed by a theodolite, &c. and a chain.

In ſurveying with the plain-table, the plotting is ſaved; the ſeveral angles and diſtances being laid down on the ſpot, as faſt as they are taken. See the article PLAIN-TABLE.

But, in working with the theodolite, ſemi-circle, or circumferentor, the angles are taken in degrees; and the diſtances in chains and links; ſo that there remains an after-operation to reduce theſe members into lines, and ſo to form a draught, plan, or map; this operation is called plotting.

Plotting then is performed by means of two inſtruments, the protractor and plotting ſcale. By the firſt, ſeveral angles obſerved in the field with a theodolite, or the like, and entered down in degrees in the field-book, are protracted on paper in their juſt quantity.

By the latter, the ſeveral diſtances meaſured with the chain, and entered down in like manner in the field-book, are laid down in their juſt proportion.

Under the articles Protractor and Plotting-ſcale, are found ſeverally the uſe of their reſpective inſtruments in the laying down of angles and diſtances: we ſhall here give their uſe conjointly in the plotting of a field, ſurveyed either with the circumferentor or theodolite.

Method of PLOTTING *from the Circumferentor.* Suppoſe an encloſure, e. gr. ABCDEFGHK (plate CII. *fig.* 6.) to have been ſurveyed; and the ſeveral angles, as taken by a circumferentor, in going round the field, and the diſtances, as meaſured by a chain, to be found entered in the field-book, as in the following table:

	Deg.	Min.	Cha.	Link.
A	191	00	10	75
B	297	00	6	83
C	216	30	7	82
D	325	00	6	96
E	12	24	9	71
F	324	30	7	54
G	98	30	7	54
H	71	00	7	78
K	161	30	8	22

On a paper of the proper dimenſions, as LMNO draw a number of parallel and equidiſtant lines. Their uſe is to direct the poſition of the protractor; the diameter whereof muſt always be laid either upon one of them or parallel thereto; the ſemi-circular limb downwards for angles greater than 180°, and upwards, for thoſe leſs than 180°.

The paper being thus prepared, aſſume a point on ſome meridian, as A, whereon lay the center of the protractor and the diameter along the line. Conſult the field-book for the firſt angle, i. e. for the degrees cut by the needle at A, which the table gives you 191°.

Now ſince 191° is more than a ſemi-circle, or 180, the ſemi-circle of the protractor is to be laid downwards; where keeping it to the point with the protracting pin, make a mark againſt 191; through which mark, from A, draw an indefinite line A *b*. The firſt angle thus protracted, again conſult the book, for the length of the firſt line AB; thus you find 10 chains 75 links. From a convenient ſcale, therefore, on the plotting ſcale, take the extent of 10 chains 75 links between the compaſſes; and ſetting one point in A, mark where the other falls in the line A *b*, which ſuppoſe in B: draw therefore the full line AB, for the firſt ſide of the incloſure.

Proceed then to the ſecond angle, and laying the center of the protractor on the point B, with the diameter as before directed, make a mark, as *c*, againſt 297°, the degrees cut at B; and draw the indefinite line B *c*. On this line from the plotting-ſcale, as before, ſet off the length of your ſecond line, viz. 6 chains 83 links; which extending from B to the point C, draw the line BC for the ſecond ſide. Proceeding now to the third angle or ſtation, lay the center of the protractor, as before, on the point C; make a mark, as *d*, againſt the number of degrees cut at C, viz. 216 degrees, 30 minutes; draw the indefinite line *d* C, and thereon ſet off the third diſtance, viz. 7 chains 82 links; which terminating, e. gr. at D, draw the full line CD for the third ſide. Proceed now to the fourth angle D; and, laying the center of the protractor over the point D, againſt 325°, the degree cut by the needle, make a mark *e*; draw the dry line D *e*, and thereon ſet off the diſtance 6 chains 96 links, which terminating in E, draw DE for the fourth line, and proceed to the fifth angle, viz. E.

Here the degrees cut by the needle being 12° 24′, which is leſs than a ſemi-circle, the center of the protractor muſt be laid on the point E, and the diameter on the meridian, with the ſemi-diameter limb turned upwards. In this ſituation make a mark, as before, againſt the number of degrees, viz. 12° 24′, cut by the needle at E; draw the dry line E *f*, on which ſet off the fifth diſtance, viz. 9 chains 71 links, which extending from E to F, draw the full line EF, for the fifth ſide of the incloſure. After the ſame manner proceed orderly to the angles F, G, H, and K; then placing the protractor, making marks againſt the reſpective degrees, drawing indefinite dry lines, and ſetting off the reſpective diſtances as above, you will have the plot of the whole incloſure ABC, &c.

Such is the general method of plotting from this inſtrument; but it muſt be obſerved, that in this proceſs the ſtationary lines, that is, the lines wherein the circumferentor is placed to take the angles, and wherein the chain is run to meaſure the diſtances, are properly the lines, here plotted. When, therefore, in ſurveying, the ſtationary lines are at any diſtance from the fence or boundaries of the field, &c. off-ſets are taken, that is, the diſtance of the fence from the ſtationary line is meaſured at each ſtation; and even at intermediate places, if there prove any conſiderable bends in the fence.

In plotting, therefore, the ſtationary lines being laid down as above, the off-ſets muſt be laid down from them, that is, perpendiculars of the proper lengths muſt be let fall at the proper places from the ſtationary lines; the extremes of which perpendiculars, being connected by lines, give the plot deſired. If inſtead of going round the field the angles and diſtances have been all taken from

one ſtation, the proceſs of plotting is obvious, from the example above; all here required being to protract, after the manner already deſcribed, the ſeveral angles and diſtances taken from the ſame ſtationary point in the field, from the ſame point or center of the paper. The extremities of the lines thus determined, being then connected by lines, will give the plot required.

The following is a new plotting inſtrument invented by Mr. Henry Beighton.—It is a plain ſmooth board, about eighteen inches ſquare and three fourths of an inch thick, as A B C D (plate CII. *fig.* 7.) made of mahogany, walnut, pear-tree or Norway oak, well clamped at the ends, or a braſs frame round it to prevent its warping, and, as much as poſſible, ſhrinking and ſwelling.

Within ſix tenths of an inch of its oppoſite ſides, and parallel to them and one another, are two grooves E F, G H, cut on the face half an inch deep, to let in two braſs holders in the ſhape of N O (*fig.* 8.) which are each of one piece of caſt braſs, like two braſs rulers joined together at right angles. The perpendicular part is one tenth and three-hundred parts of an inch thick, as at *d*, half an inch deep, and a little ſhorter at each end than the upper part, which is ſeventeen inches long, three tenths broad, and about eight parts of a hundredth of an inch thick; about two inches and a half from each end of the holder, are thick parts or boſſes in the upright piece, as at P and Q, through which are holes drilled to receive the ſcrews P S, Q R, which ſcrews go through a braſs plate at T and V, fixed by rivets on the under ſide of the table, and little round nuts, as at *a* and *b*, put on them, to confine them in their ſhoulders in turning in the plates, that they never riſe nor fall; theſe holes muſt go eaſy in the grooves, to ſink even with the upper ſurface of the table. Then when the ſcrews enter the holes of the holders by turning R and S at the ſame time forward, the holders will fall and pinch down any papers, &c. that are under them; and turning backward will riſe and releaſe them. In the middle of one end of the table is a groove to receive the braſs W, which has the ſame ſort of ſcrew and fixing as the other to riſe or fall at. But the groove is quadranial, that the holder W may on occaſion be turned ſo as to lie all on the outſide the line E K, and to croſs it in caſe of high winds, for ſecuring the papers down, on three ſides; and a fourth might be added, but there is ſeldom any occaſion for it.

To the center of the table underneath is fixed a braſs ſocket, ſo truly made that the table may, when ſet, turn round truly, horizontally: and a machine caſed with glaſs in which a plummet hangs to ſet the table level; or the parallel plates, or glaſs tubes of ſpirit of wine, may be uſed to make it horizontal, as any one ſees occaſion to fancy them.

To any one of the four edges underneath is ſcrewed a box and needle, ſet to the variation.

There belongs to this inſtrument a ſtrong three-legged ſtaff, and an index with plain or teleſcope ſights, near two feet long.

The papers or charts for this table are to be either a thin fine paſte-board, fine paper paſted on cartridge-paper, or two papers paſted together, cut as exactly ſquare as poſſible, each ſide being nearly ſixteen inches and a half long, juſt as they may ſlide in eaſy between the upright part, and between the flat part of the holders.

Any of theſe charts may be put in the table four different ways, be fixed, taken out, or changed at pleaſure; any two of them may be joined together truly on the table, if you make each of them meet exact at the line L M, whilſt near one half of each will hang over the ſides of the table; or, by creſting, or doubling each, the whole of them will be within the table. And if occaſion ſhould happen, as ſeldom it does, by creſting each paper both ways through the middle, four of them may be put on at one time, meeting in the center of the table.

Each chart is always croſſed by right angles through the middle, for the purpoſe above, and to make any of them anſwer to the guide lines on the table I K, L M, drawn quite through the center, and the whole table.—So the grand objection of ſhifting papers is obviated.

PLOTTING-SCALE, a mathematical inſtrument, uſually of wood, ſometimes of braſs, or other matter; and either a foot, or half a foot long. See SCALE.

On one ſide of the inſtrument (plate CII. *fig.* 9) are ſeven ſeveral ſcales, or lines, divided into equal parts. The firſt diviſion of the firſt ſcale is ſubdivided into ten equal parts, to which is prefixed the number 10, ſignifying that ten of thoſe ſubdiviſions make an inch; or that the diviſions of that ſcale are decimals of inches.

The firſt diviſion of the ſecond ſcale is likewiſe ſubdivided into 10, to which is prefixed the number 16, denoting that 16 of thoſe ſubdiviſions make an inch.—The firſt diviſion of the third ſcale is ſubdivided in like manner into 10, to which is prefixed the number 20.—To that of the fourth ſcale is prefixed the number 24; to that of the fifth 32; that of the ſixth 40; that of the ſeventh 48; denoting the number of ſubdiviſions equal to an inch, in each, reſpectively.

The two laſt ſcales are broken off before the end, to give room for two lines of chords marked by the letters *ct.* See CHORD.

On the back-ſide of the inſtrument is a diagonal ſcale, the firſt of whoſe diviſions, which is an inch long, if the ſcale be a foot, and half an inch, if half a foot, is ſubdivided, diagonally, into 100 equal parts.—At the other end of the ſcale is another diagonal ſubdiviſion, of half the length of the former, into the ſame number of parts, viz. 100.

Next the ſcales, is a line divided into hundredth parts of a foot, numbered 10, 20, 30, &c. and a line of inches ſubdivided into tenth parts, marked, 1, 2, 3, &c.

As to the uſe of the plotting ſcale, if we were required to lay down any diſtance upon paper, ſuppoſe 6 chains 50 links: draw an indefinite line; then ſetting one foot of the compaſſes at figure 6 on the ſcale, e. gr. the ſcale of 20 in an inch, extend the other to 5 of the ſubdiviſions, for the 50 links: this diſtance, being transferred to the line, will exhibit the 6 chains 50 links required.

If it be deſired to have 6 chains 50 links take up more or leſs ſpace, take them off from a greater or leſſer ſcale, that is, from a ſcale that has more or fewer diviſions in an inch.

To find the chains and links contained in a right line, e. gr. that is juſt drawn, according to any ſcale, e. gr. that of 20 in an inch. Take the length of the line in the compaſſes, and applying it to the given ſcale, you will find it extend from the number 6 of the great diviſions, to 5 of the ſmall ones: hence the given line contains 6 chains 50 links.

PLOVER, *Pluvialis*, in ornithology, the Engliſh name of ſeveral diſtinct birds; as the green plover, or variegated black and yellowiſh charadrius, about the ſize of the common lapwing; and the grey plover, or blackiſh-brown tringa, with a black beak and green legs, a very beautiful bird.

Baſtard PLOVER, the name by which the vanellus, or lapwing, is called in ſeveral parts of the kingdom. See VANELLUS.

PLOUGH, in agriculture, a machine for turning up the ſoil, contrived to ſave the time, labour, and expence, that without this inſtrument muſt have been employed in digging land, to prepare it for the ſowing of all kinds of grain.

The ſtructure of a plough is various for various kinds of grounds; but the common two-wheeled plough, in plate CIII. *fig.* 1. uſed in almoſt all the counties in the ſouth of England, is generally eſteemed the beſt for all ſorts of land, except ſuch miry clays as ſtick to the wheels, and clog them up ſo as to prevent their turning round. It is commonly divided into two parts, the plough-head, and the plough-tail. The plough-head contains the two wheels A, B, and their axis, or iron-ſpindle, which paſſes through the box C, and turns round both in it and in the wheels; the two crow-ſtaves D, D, faſtened perpendicularly into the box, having in each two rows of holes, in order to raiſe or ſink the beam, by pinning up or down the pillow E, to encreaſe or diminiſh the depth of the furrow; the gallows F, through which the crow-ſtaves paſs at top, by mortiſes into which they are pinned; G the wilds, with its links and crooks of iron, by which the plough is drawn; H the tow-chain, which faſtens the plough-tail to the plough-head, by the collar

5 JA 59

collar I at one end, and by the other end paſſing through a hole in the middle of the box, where it is pinned in by the ſtake K; L the bridle-chain, one end of which is faſtened to the beam with a pin, and the other end to the top of the ſtake, which ſtake is held up to the left crow-ſtaff, by the end of the with or rope M paſſing round it above, and under the end of the gallows below, or by the end of the bridle-chain itſelf, when that is long enough. The plough-tail conſiſts of the beam, N; the coulter, O; the ſhare, P; and the ſheat, Q; the hinder ſheat, R, paſſing through the beam near its end; S the ſhort handle, faſtened to the top of the hinder ſheat by a pin, and to the top of the fore-ſheat by another pin; T the drock, which belongs to the right-ſide of the plough-tail, and to which the ground-wriſt V is faſtened; as is the earth-board, whoſe fore-part W, is ſeen before the ſheat; as alſo the long handle X, whoſe fore-part Y appears before the ſheat, and is faſtened to the drock by the pin at *a*, the other end of which pin goes into the beam. Z is the double retch, which holds up the ſheat, and paſſes through the beam to be faſtened by its ſcrews and nuts at *b* and *c*.

The ſtructure of the four-coultered plough (*fig.* 2.) is in ſeveral reſpects different from this, though in general founded on it. Its beam is ten feet four inches long, whereas that of the common plough is but eight feet: it differs alſo in ſhape; for as the other is ſtraight from one end to the other, this is ſtraight only from *a* to *b*, and thence turns up, in the manner ſhewn in the plate; ſo that a perpendicular line let down from the corner at *a*, to the even ſurface on which the plough ſtands, would be eleven inches and an half, which is its height in that place; and if another line was let down from the turning of the beam at *b*, to the ſame ſurface, it would be one foot eight inches and a half, which is the height the beam ſtands from the ground at that part; and a third line let down to the ſurface from the bottom of the beam, at that part which bears upon the pillow, will ſhew the beam to be, in that part, two feet ten inches high above the ſurface. At the diſtance of three feet two inches from the end of the beam, at the plough-tail, the firſt coulter, or that next the ſhare, is let through: and at thirteen inches from this, a ſecond coulter is let through: a third at the ſame diſtance from that; and finally, a fourth at the ſame diſtance from the third. The crookedneſs of the beam is to avoid the too great length of the fore-moſt coulters, which would be ſo long if the beam was ſtraight all the way, that they would be apt to bend and be diſplaced, unleſs they were vaſtly thick and clumſy.

The ſheat in this plough is to be ſeven inches broad, and the fixing the ſheat in this, as well as in the common plough, is the niceſt part, and requires the utmoſt art of the maker; for ſuppoſing the axis of the beam, and the left ſide of the ſhare to be both horizontal, they muſt never be ſet parallel to each other; but the ſtraight ſide of the ſhare muſt make an angle on the left-ſide of the beam, which muſt be very acute, that the tail of the ſhare may preſs leſs againſt the ſide of the trench than the point does: this angle is ſhewn by the pricked lines at the bottom of *fig.* 1. where the line *e f* is ſuppoſed to be the axis of the beam let down to the ground, and the line *g h*, parallel to the left-ſide of the ſhare. The great thing to be taken care of, is the placing the four coulters, which muſt be ſo ſet that the four imaginary planes deſcribed by the four edges, as the plough moves forwards, may be all parallel to each other, or very nearly ſo; for if any one of them ſhould be very much inclined to, or ſhould recede much from either of the other, then they would not enter the ground together. In order to the placing them thus, the ſecond coulter-hole muſt be two inches and a half more on the right-hand than the firſt; the third muſt be as much more to the right of the ſecond; and the fourth the ſame diſtance to the right of the third: and this two inches and a half muſt be carefully meaſured from the center of one hole to the center of the other. Each of theſe holes is a mortiſe of an inch and a quarter wide, and is three inches and a half long at the top, and three inches at the bottom. The two oppoſite ſides of the hole are parallel to the top and bottom, but the back is oblique, and determines the obliquity of the ſtanding of the coulter, which is wedged tight up by pieces of wood. The coulters are two feet eight inches long, of which ſixteen inches are allowed for the handles, which is to be thus long, that the coulter may be drawn down as the point wears away. As to the wheels, the left-hand wheel is twenty inches diameter, and that on the right hand, two feet three inches; and the diſtance the wheels are ſet from each other is two feet five inches and a half.

Beſides theſe there are, the Lincolnſhire plough, proper for fenny-lands ſubject to weeds and ſedges, and remarkable for the largeneſs of its ſhare, which is frequently a foot broad and very ſharp, (*fig.* 3.) At A is a foot, which is ſet higher or lower, by a wedge drove in at B; and which keeps the fore part of the plough from going deeper than they would have it. At C there are wedges by which the hinder part is ſet. Inſtead of a coulter there is a wheel with a ſharp edge, which cuts the roots of the graſs or ſedge as it turns round, while the broad ſhare cuts them up at the bottom.

The Caxton or trenching plough, invented to cut drains about Caxton in Cambridgeſhire, in ſtiff, miry, clay ground. This plough (*fig.* 4.) is larger and ſtronger than an ordinary: to the beam is fixed a piece of wood at A, in which is a coulter ſet at B, and another ſet in the beam at C, which two coulters ſtand bending inwards as at D, to cut each ſide of the trench. The ſhare is very flat and broad, in order to form the bottom of the trench; and the mould board is three times the length of other ploughs, in order to caſt the turf a great way from the trench. This plough cuts a trench a foot wide at the bottom, a foot and a half broad at the top, and a foot deep, and it is drawn with twenty horſes.

But the moſt common plough, ſays Mortimer, is the dray-plough repreſented in *fig.* 6. which is beſt for miry clays, when the land is ſoft; but is extremely bad in ſummer, when the land is hard, becauſe its point will be continually flying out of the ground: it is ſet higher or lower, by wedges at *a*. *Fig.* 5. is a Spaniſh plough, with which and one horſe, they will plough two or three acres of their light lands in a day. We have given a figure of it, merely on account of its ſingularity.

PLOUGH, among book-binders, is a machine for cutting the edges of the leaves of books ſmooth.

PLOUGHMAN, the perſon who guides the plough in the operation of tilling.

PLOUGHING, or PLOWING, in agriculture, the art of turning up the earth with a plough.

Ploughing is principally either that of lays or of fallows. Ploughing of lays, is the firſt cutting up of graſs-ground for corn, and is a work commonly performed in January. The beſt time for doing it is when the land is wet, becauſe the turf is then ſoft and tough, and will turn up without breaking. In the well turning of this conſiſts the chief part of this ſort of ploughing, which if rightly performed, will lay the turf ſo flat and true, that it can hardly be ſeen where the plough went. This, indeed, depends greatly upon the make of the plough; but if the earth-board does not turn the turf well, ſome nail upon it a ſmall piece of wood to take the upper part of the earth as it riſes upon the earth-board, which cauſes it to fall with the graſs-ſide downwards. Ploughing of fallows, called alſo fallowing, is preparing land by ploughing long before it is ploughed for ſeed. See the article FALLOWING.

PLUM-TREE, in botany, a genus of plants, the flower of which conſiſts of five roundiſh, concave, and large petals: the fruit is a roundiſh drupe, marked with a longitudinal furrow, and containing a compreſſed and acute-pointed nut, with the ſutures ſtanding out each way in an edge.

PLUMAGE, the feathers which ſerve birds for a covering.

PLUMBAGO, MOCK-LEAD, in mineralogy, a foſſile ſubſtance reſembling lead-ore, much uſed in drawing, and for making pencils.

PLUMBERY, the art of caſting, preparing, and working of lead, and of uſing it in buildings, &c.

The word is formed of the Latin, *plumbum*, lead.

The lead uſed in plumbery, is furniſhed from the lead works in large ingots called pigs of lead, ordinarily weighing about a hundred pounds a piece.

As lead melts very eaſily, it is no hard matter to caſt figures hereof by running it into moulds. But the chief article in plumbery is the ſheets and pipes of lead.

PLUMBUM, lead, in natural hiſtory. See the article LEAD.

PLUMMET, PLUMB-RULE, or PLUMB-LINE, an inſtrument uſed by carpenters, maſons, &c. in order to judge whether walls, &c. be upright planes, horizontal, or the like. It is thus called from a piece of lead, *plumbum*, faſtened to the end of a cord, which uſually conſtitutes this inſtrument. Sometimes the ſtring deſcends along a wooden ruler, &c. raiſed perpendicularly on another; in which caſe it becomes a level. See LEVEL.

PLUMMING, among miners, is the method of uſing a mine-dial, in order to know the exact place of the work where to ſink down an air-ſhaft, or to bring an adit to the work, or to know which way the load inclines when any flexure happens in it.

It is performed in this manner: A ſkilful perſon, with an aſſiſtant, and with pen, ink, and paper, and a long line and a ſun-dial, after his gueſs of the place above ground, deſcends into the adit or work, and there faſtens one end of the line to ſome fixed thing in it, then the incited needle is let to reſt, and the exact point where it reſts is marked with a pen: he then goes on farther in the line ſtill faſtened, and at the next flexure of the adit he makes a mark on the line by a knot or otherwiſe; and then letting down the dial again, he there likewiſe notes down that point at which the needle ſtands in this ſecond poſition. In this manner he proceeds, from turning to turning, marking down the points, and marking the line till he comes to the intended place; this done, he aſcends, and begins to work on the ſurface of the earth what he did in the adit, bringing the firſt knot in the line to ſuch a place where the mark of the place of the needle will again anſwer its pointing, and continues this till he comes to the deſired place above ground, which is certain to be perpendicularly over the part of the mine into which the air-ſhaft is to be ſunk.

PLUMOSE, ſomething formed in the manner of feathers, with a ſtem and fibres iſſuing from it on each ſide: ſuch are the antennæ of certain moths, butterflies, &c.

PLUNGER, in mechanics, the ſame with the forcer of a pump. See FORCER.

PLURAL, *Pluralis*, in grammar, an epithet applied to that number of nouns and verbs which is uſed when we ſpeak of more than one thing; or that which expreſſes a plurality or number of things. See the article NUMBER.

PLURALITY, *Pluralitas*, a diſcrete quantity, conſiſting of two or a greater number of the ſame kind: thus we ſay a plurality of gods, &c.

Hence plurality of benefices, or livings, is where the ſame clerk is poſſeſſed of two or more ſpiritual preferments, with cure of ſouls.

PLUS, in algebra, a character marked thus +, uſed for the ſign of addition. See CHARACTER.

PLUSH, in commerce, &c. a kind of ſtuff having a ſort of velvet knap, or ſhag, on one ſide, compoſed regularly of a woof of a ſingle woolen thread and a double warp, the one wool, of two threads twiſted, the other goats or camels hair; though there are ſome pluſhes entirely of worſted, and others compoſed wholly of hair.

Pluſh is manufactured, like velvet, on a loom with three treadles; two of theſe ſeparate and depreſs the woolen warp, and the third raiſes the hair-warp, upon which the workman throwing the ſhuttle, paſſes the woof between the woollen and hair-warp; and afterwards laying a braſs-broach, or needle, under that of the hair, he cuts it thereon with a knife deſtined for that uſe; conducting the knife on the broach, which is made a little hollow all its length, and thus gives the ſurface of the pluſh an appearance of velvet. See VELVET.

There are other kinds of pluſh, all of ſilk; ſome of which have a pretty long knap on one ſide, and ſome on both.

PNEUMATICS, called alſo PNEUMATOLOGY and PNEUMATOSOPHY, among the ſchoolmen, the doctrine and contemplation of ſpirits and ſpiritual ſubſtances, as God, angels, and the human ſoul, in which ſenſe pneumatics are the ſame with what we otherwiſe call metaphyſics. See METAPHYSICS.

PNEUMATICS is more commonly uſed among us, for that part of natural philoſophy which treats of the nature and properties of the air; the doctrine and laws of which will be found under the articles AIR, ATMOSPHERE, &c.

PNEUMATIC ENGINE. See the article AIR-PUMP.

PNEUMATOCELE, HERNIA FLATULENTA, or WINDY-RUPTURE, in ſurgery and medicine, a ſpecies of hernia, which ſeveral authors aſſure us occurs in practice. The ſigns by which they tell us it may be diſcovered are, 1. That upon handling the ſcrotum it feels like a bladder diſtended with wind; and that, therefore, 2. it ſeems to be much lighter than if it contained any humour, appearing alſo pellucid at the approach of a candle; and, 3. if it be ſtruck by a fillip of the finger, it ſounds like a bladder which is diſtended with wind, and ſtruck in the ſame manner. However, Heiſter is of opinion that theſe authors have miſtaken the hydrocele or enterocele for the pneumatocele, and ſeems to be more confirmed in this opinion, not only becauſe the ſymptoms and cure of this diſorder, with which they acquaint us, agree exactly with thoſe of the hydrocele, but becauſe that in all his practice he never obſerved any thing like this diſorder; this makes him at leaſt ſuſpect that the caſe does not ſo often occur as ſome would inſinuate: but whenever it is met with he directs to proceed in the cure as follows. Let the tumour be treated externally with warm and diſcutient medicines, as in the hydrocele, together with fomentations and plaſters; and internally may be taken carminative and gentle purges: but if theſe take no effect, and the tumour ſtill increaſes, or continues the ſame, the ſcrotum ſhould then be perforated with the trochar, and its contents thereby diſcharged, which will demonſtrate whether it be wind or water.

PNEUMATOMACHI, Πνευμοτομαχοι, ancient heretics, ſo called becauſe they oppoſed the divinity of the Holy Spirit, placing him in the number of creatures.

PNEUMONICS, in pharmacy, medicines proper in diſeaſes of the lungs, in which reſpiration is affected. Of this number are ſulphur, lungwort, hyſſop, ground-ivy, and colt's-foot: they are uſed in phthiſes, aſthmas, peripneumonies, pleuriſies, &c.

POA, meadow-graſs, in botany, a genus of plants, the corolla whereof is compoſed of two valves, of an ovato-acuminated figure, hollow, compreſſed, and ſomewhat longer than the cup, and without awns. It ſupplies the place of a pericarpium; and adheres every way to the ſeed, which is ſingle, of an oblong figure, compreſſed, and pointed at each end.

This is the moſt common of all graſſes with us, and makes principally the green covering of moſt of our fields and meadows.

POCKET, in the woolen trade, a word uſed to denote a larger ſort of bag, in which wool is packed up to be ſent from one part of the kingdom to another. The pocket contains uſually twenty-five hundred weight of wool.

POD, among botaniſts, a term uſed to expreſs a pericarpium conſiſting of two valves, which open from the baſe to the point, and are ſeparated by a membranaceous partition, from which the ſeeds hang by a kind of funiculus umbilicalis.

PODAGRA, in medicine, the gout in the feet. See GOUT.

PODOMETER, or PEDOMETER, the ſame with perambulator. See PERAMBULATOR.

PODARIA, in zoology, a diviſion, order, or ſeries of wingleſs inſects, with ſhort bodies, and not very numerous legs; comprehending the puceron, pediculus, acarus, ſpider, ſquill, &c.

PODEX, in anatomy, &c. the ſame with anus or fundament. See ANUS.

POEM, Ποιημα, a compoſition in verſe of a due length and meaſure. See the article VERSE, and MEASURE.

Poems are generally denominated from the ſubject matter, as the apobaterion, epibaterion, epinicion, epithalamium, genethliac, elegiac, ſatiric, epitaph, panegyric, lyric, paſtoral, &c. and others, from the manner of narration, as epic, dramatic, &c. to which may be added, odes,

odes, eclogues, and idylliums. To this head may alſo be referred ſeveral other compoſitions of a leſs ſerious kind, as the acroſtic, enigma, anagram, cento, echo, &c.

The Abbé Du Bos obſerves, in regard to poems, that ſome are intereſting in general, others in particular; that the beauties of execution alone do not conſtitute a good poem; that the defects of poems are leſs diſcernible than thoſe of a picture; that our diſlike falls only on the bad part of a poem; that every kind of poem has ſomething particular in its ſtyle; that by the beauty of the ſtyle we muſt judge of poems; that it muſt be a long time before the merit of a good poem is diſtinguiſhed; and finally, that the character of the poetic ſtyle has always decided the good or bad ſucceſs of poems, even of thoſe which by their length ſeem to have the greateſt dependance on the œconomy of the plan, on the diſtribution of the action, and on the decency of the manners.

POESY, the ſame with poetry. See POETRY.

POET, ποιητης, the author of a poem. See POEM.

POETICAL, ſomething that relates to poetry or poets, in which ſenſe we ſay poetical genius, poetical licence, &c.

POETICAL *Juſtice*, is chiefly uſed in reſpect of the drama, to denote a diſtribution of rewards and puniſhments to the ſeveral perſons at the cataſtrophe or cloſe of a piece, anſwerable to the ſeveral characters they appeared in.

POETICAL *riſing and ſetting of the Stars*. The three kinds of riſing and ſetting, viz. the coſmical, acronical, and heliacal, were made by the ancient poets referring the riſing, &c. of the ſtars to that of the ſun. See COSMICAL, &c.

POETICS, the doctrine of poetry, or the laws and rules of conducting pieces, or compoſitions of poetry: ſuch is Ariſtotle's Poetics, a work much valued.

POETRY, the art of compoſing poems, or pieces in verſe; or, as defined by Voſſius, the art of repreſenting actions in metre.

Voſſius thinks that love was the firſt occaſion of poetry, which is not improbable, conſidering that this affection is coeval with mankind, is univerſal, and naturally productive of poetry; yet it undoubtedly owes its increaſes and progreſs to religion: Dacier indeed calls it the offspring of religion; and it is certain, in the earlieſt ages of the world, that it was uſual to ſing hymns to the honour of the gods upon ſolemn feſtivals. Du Bos thinks that poetry has been employed in all ages, even by the moſt unpoliſhed nations, to preſerve the memory of paſt events. Its principal aim is to flatter our ſenſes and imagination; for, according to Plato, it awakens the ſpiritual empire of the ſoul. Every kind of poetry charms us in proportion to its object, ſays Du Bos; and to be very affecting, it ought to be very exact. It is not the ſame with poetry as with other arts, for an ignorant perſon may judge of poetry by the impreſſion it makes on him; whence all men have a right to give their opinion, and this judgment ought to be founded on experience rather than on argumentation. Poetry is an art where every thing ſhould pleaſe. It is not enough to exhibit nature, which in certain places and circumſtances is rude and unpleaſant; but the poet muſt chuſe in her what is beautiful from what is not: whence a poet ought to chuſe, for the ſubject of his imitation, ſomething that is naturally affecting. There is a particular rhetoric for poetry, which conſiſts in diſcerning very preciſely what ought to be ſaid figuratively, and what to be ſpoken ſimply; and in knowing where ornament is required, and where not: yet the ſtyle ſhould be copious, and every ſpecies of writing in this art ſhould have a diction proper to itſelf.

The qualifications then neceſſary for poetry, or thoſe which form a good poet, are ſeldom found united in one perſon: he muſt have an extraordinary genius, great natural gifts, a wit juſt, piercing, ſolid, and univerſal; an underſtanding clear and diſtinct; an imagination neat and pleaſant; an elevation of ſoul that depends not on art, or ſtudy, and which is purely a gift of heaven, and muſt be ſuſtained by a lively ſenſe and vivacity, a great judgment to conſider wiſely of things, and a vivacity to expreſs them with that grace and abundance which gives them beauty. In fine, to accompliſh a poet, is required a temperature of wit and fancy, of ſtrength and ſweetneſs, of penetration and delicacy; but, above all, he muſt have a ſovereign eloquence, and a profound capacity. Theſe are the qualities that muſt concur together to form the genius of a poet, and ſuſtain his character. The rules of poetry and verſifying are taught by art, and acquired by ſtudy; but this force and elevation of thought, which Horace calls ſomething divine, and which alone makes the poetry of any value, muſt be derived from nature; or, according to Ariſtotle, from ſome happy tranſports, to which that author gives the name of madneſs. Hence the critics conclude, the end of poetry is to pleaſe; its cauſe, either the excellence of the poet's genius, or a poetical fury and tranſport of the ſoul, manageable by the judgment; its matter, long and ſhort ſyllables, and feet compoſed hereof, with words furniſhed by grammar; and its form, the arrangement of all theſe things in juſt and agreeable verſe, expreſſing the thoughts and ſentiments of the author after the manner already mentioned. But after all, how narrow are all theſe bounds, if we conſider poetry in the light wherein the works of Homer and Virgil have ſet it! This, which is therefore diſtinguiſhed by the name of the greater poetry, in contradiſtinction to the low and ſimple, or verſification, conſiſts principally in fiction, or the invention of fables, in the expreſſing of things by allegories and metaphors, and in the inventing of actions, under which the truths which the poet has to teach, may be agreeably diſguiſed.

POINT, a term uſed in various arts.

POINT, *Punctum*, in geometry, as defined by Euclid, is a quantity which has no parts, or which is indiviſible. Points are the ends or extremities of lines. If a point be ſuppoſed to be moved any way, it will, by its motion, deſcribe a line.

POINT, in phyſics, the leaſt ſenſible object of ſight, marked with a pen, point of a compaſs, or the like. Of ſuch points all phyſical magnitude conſiſts. This phyſical point is the ſame with what Mr. Locke calls the point ſenſible, and which he defines to be the leaſt particle of matter, or ſpace, we can diſcern. He adds, that to the ſharpeſt eye, this is ſeldom leſs than thirty ſeconds of a circle, whereof the eye is the center.

POINT, in grammar, a character uſed to mark the diviſions of diſcourſe. A point proper, is what we otherwiſe call a full ſtop or period. See PERIOD.

The points, or vowel-points, in the Hebrew grammar, are certain characters which, in the writings of that language, ſerve to mark the vowels. The antiquity of theſe points make the ſubject of a celebrated controverſy; ſome maintaining their origin to be the ſame with that of the Hebrew language; and others aſſerting them to have been firſt introduced by Eſdras, after the Babyloniſh captivity, when he compiled the canon, tranſcribed the books into the preſent Chaldee character, and reſtored the purity of the Hebrew text. Some will have them invented by the doctors of the ſchool of Tiberias, uſually called the Maſſoretes, five or ſix hundred years after Chriſt.

POINT, in muſic, a mark or note anciently uſed to diſtinguiſh the tones or ſounds: hence we ſtill call it ſimple counter-point, when a note of the lower part anſwers exactly to that of an upper; and figurative counter-point, when any note is ſyncopated, and one of the parts makes ſeveral notes or inflexions of the voice, while the other holds on one.

We ſtill uſe a point, to raiſe the value of a note, and prolong its time by one half; e. g. a point added to a ſemibreve, inſtead of two minims, makes it equal to three; and ſo of the other notes.

POINT, in aſtronomy, a term applied to certain points or places, marked in the heavens, and diſtinguiſhed by proper epithets.

The four grand points or diviſions of the horizon, viz. the eaſt, weſt, north, and ſouth, are called the cardinal points.

The zenith and nadir are the vertical points; the points wherein the orbits of the planets cut the plane of the ecliptic, are called the nodes: the points wherein the equator and ecliptic interſect, are called the equinoctial points; particularly, that whence the ſun aſcends towards the north pole, is called the vernal point; and that by which he deſcends to the ſouth pole, the autumnal point.

POINT *of the Horizon*, or *Compaſs*, in navigation and geography. See the articles HORIZON and COMPASS.

POINT is alſo uſed for a cape or headland, jetting out into the ſea: thus ſeamen ſay, two points of land are in one another, when they are ſo in a right line againſt each other, as that the innermoſt is hindered from being ſeen by the outermoſt.

POINTS, in heraldry, are the ſeveral different parts of an eſcutcheon, denoting the local poſitions of any figure.

POINT is alſo uſed in heraldry for the loweſt part of the eſcutcheon, which uſually terminates in a point.

POINT is alſo an iron or ſteel-inſtrument uſed with ſome variety in ſeveral arts. Engravers, etchers, cutters in wood, &c. uſe points to trace their deſigns on the copper, wood, ſtone, &c.

POINT, in the manufactories, is a general term uſed for all kinds of laces wrought with the needle; ſuch are the point de Venice, point de France, point de Genoa, &c. which are diſtinguiſhed by the particular oeconomy and arrangement of their points.

POINT, in poetry, denotes a lively briſk turn, or conceit, uſually found or expected at the cloſe of an epigram.

POINT-BLANK, in gunnery, denotes the ſhot of a gun levelled horizontally. See GUNNERY.

POINTS, little flat platted cords, by which the ſails are reefed. See REEF, and EARING.

POINTING, in grammar, the art of dividing a diſcourſe, by points, into periods and members of periods, in order to ſhew the proper pauſes to be made in reading, and to facilitate the pronunciation and underſtanding thereof.

POINTING, in war, the levelling a cannon, or mortar, ſo as to play againſt any certain point.

POINTING, among ſailors, the act of tapering the end of a rope, ſo as to make it ſtiff, that it may eaſily enter ſome hole or other; it is afterwards covered by a kind of matt, or coat, which they weave round it.

POISON, in medicine, a malignant quality in ſome animal, vegetable, or mineral body, which renders it hurtful and even mortal to thoſe who take it.

There are three eſſential marks of poiſons, which diſtinguiſh them from other things that are noxious to human bodies. The firſt is, that they conſiſt of moſt ſubtile parts, and are conſequently pernicious in a ſmall quantity. The ſecond, that they in a ſhort time prevent the regular motions of the ſolids and fluids throughout the body, and induce the moſt grievous ſymptoms, and even death itſelf. And the third, that they exerciſe their cruelty on the moſt ſubtile fluids, and the moſt nervous parts. Poiſons are of various kinds, and operate in various manners; ſome by diſſolving the blood, others by coagulating it, and others by corroding and deſtroying the ſolid parts. All the three kingdoms have poiſons peculiar to themſelves; but the animal kingdom affords the moſt ſubtile, which are communicated by the bite of mad or venomous beaſts, when they are angered. The mineral kingdom produces arſenicals and mercurials. And the vegetable, herbs and plants of a moſt acrid, noxious, and deleterious quality, ſuch as the moſt violent cathartics and narcotics. Every ſort of poiſon ſeems to have an effect peculiar to itſelf; thus arſenic occaſions the moſt cruel torments, convulſions, mortification of the coats of the inteſtines: the ſeeds of datura induce madneſs or abſolute ſtupidity: opium brings on ſleepineſs, and a torpor on the mind: the berries of deadly nightſhade produce madneſs, rage, or folly: litharge, unwarily taken, cauſes a convulſive colic, with an obſtinate coſtiveneſs: the bite of a mad dog occaſions the dread of water: the venom induced by the ſting of a tarantula, produces wonderful effects; for the patient is delighted with muſical inſtruments, and when he hears their ſounds, immediately falls to capering: the ſting of a ſcorpion produces a ſudden chilneſs and exceeding cold ſweats. The mineral kingdom furniſhes very few real poiſons; the only natural one is cobalt; the factitious are arſenic, corroſive ſublimate, and glaſs of antimony. The moſt dangerous vegetable poiſons are the true hemloc, wolf's bane, the deadly nightſhade, henbane, and datura, to which may be added the roots of hemloc-drop-wort.

Milk mixed with oil, is an excellent remedy againſt all corroſive poiſons. Hoffman ſays, that he once prevented the death of ten young perſons, who had taken among them almoſt two ounces of arſenic in water-gruel, which in a ſhort time produced the higheſt anxieties, and corroding tortures, by oil of ſweet almonds and milk. They took at leaſt ten quarts a-piece, which they vomited up again before the reaching to vomit ceaſed. The ſame author alſo affirms, that milk, in a large quantity, is an univerſal remedy againſt all poiſons that kill by inflammation, as hemloc does; and, if taken in time, will prevent their dreadful conſequences. Allen thinks a vomit with warm water and oil, taken in large draughts, and often repeated, will be of great ſervice; as alſo warm with freſh butter; milk and oil, or milk and butter: but for fat broths, which he alſo recommends, or any thing elſe which requires ſome time for the preparation, they only allow the poiſon to take deeper root, and therefore ought not to be waited for. If the above things will not provoke the patient to vomit, oxymel of ſquills, ſalt of vitriol, or a decoction of tobacco may be uſed, as having a more immediate effect. It is hardly ſafe to give even the moſt gentle cathartic. The ſtomach being thus emptied of all, or as much as poſſible of the hemloc, recourſe muſt be had to generous wine and alexipharmics, ſuch as venice-treacle, the bezoardic powder, &c. When there is a ſuſpicion that the coats of the ſtomach or inteſtines are corroded, or ulcerated, it will not be proper for the patient to uſe ſpices or vinegar, nor to indulge in drinking too much wine; but to take a decoction of barley with raiſins, and a decoction of china-root, ſaſſafras, &c. The ſame method is moſt likely to anſwer when any deleterious herb or root has been eaten by miſtake, though the particular ſpecies ſhould not be known: and Hoffman affirms, that when the patient has been ſtupified by narcotics, the beſt remedies are vomits mixed with oil.

To POISON *a Piece*, with gunners, is the ſame as to clog and nail it up.

POISON-WEED, *Toxicodendron*, in botany. See TOXICODENDRON.

POLACRE, among ſeamen, a ſhip which, contrary to the common method, has caſt off her maſts, formed of one piece of timber for the whole length, and without the addition of top-maſts. Some polacres are fitted with two maſts, but in general they have three; and are alſo diſtinguiſhed by a prow, formed in a manner quite different to thoſe of other ſhips. See PROW.

POLAND, a large kingdom of Europe, ſituated between 16° and 34° eaſt longitude. and between 46° and 57° north latitude; bounded by Ruſſia on the north and eaſt; by Beſſarabia, Moldavia, Tranſilvania, and Hungary on the ſouth; and by Pomerania, Brandenburg, and Sileſia on the weſt; being almoſt ſquare, and ſeven hundred miles over either way.

The conſtitution of Poland is a mixed monarchy, in which the nobility and gentry ſeem to have the greateſt ſhare, whence it is frequently called a republic. The king is elective by the whole body of the gentry, who oblige him to ſwear to what conditions they pleaſe.

POLAR, in general, ſomething relating to the poles of the world, or poles of the artificial globes: thus we meet with polar circles, polar dial, polar projection, &c.

POLARITY, the quality of a thing conſidered as having poles; but chiefly uſed in ſpeaking of the magnet.

POLE, πολος, in aſtronomy, one of the extremities of the axis on which the ſphere revolves.

Theſe two points, each 90° diſtant from the equinoctial or equator, are by way of eminence called the poles of the world; and the extremities of the axes of the artificial globes correſponding to theſe points in the heavens are termed the poles thereof.

POLES, in ſpherics, a point equally diſtant from every part of the circumference of a great circle of the ſphere, as the center is in a plane figure; or it is a point 90° diſtant from the plane of a circle, and in a line, called the axis, paſſing perpendicularly through the center. The zenith and nadir are the poles of the horizon; and the poles of the equator are the ſame with thoſe of the ſphere.

POLES *of the Ecliptic*, are two points on the ſurface of the

the ſphere, 23° 30′ diſtant from the poles of the world, and 90° diſtant from every part of the ecliptic.

POLES, in magnetics, are two points of a loadſtone, correſponding to the poles of the world; the one pointting to the north, the other to the ſouth. See the article MAGNET.

POLE, or VERTEX *of a Glaſs*, in optics, is the thickeſt part of the convex, or the thinneſt of a concave-glaſs. If the glaſs be truly ground, the pole will be exactly in the middle of its ſurface.

POLE, PERCH, or ROD, in ſurveying, is a meaſure containing ſixteen feet and a half.

POLE, or POLAR-STAR, is a ſtar of the ſecond magnitude, the laſt in the tail of urſa minor.

The nearneſs of this ſtar to the pole, whence it happens that it never ſets, renders it of vaſt ſervice in navigation, &c. for determining the meridian line, the elevation of the pole, and, conſequently, the latitude of the place, &c.

POLEMICAL, in matters of literature, an appellation given to books of controverſy, eſpecially thoſe in divinity.

POLEMOSCOPE, in optics, a kind of reflecting perſpective glaſs, invented by Hevelius, who commends it as uſeful in ſieges, &c. for diſcovering what the enemy is doing, while the ſpectator lies hid behind an obſtacle.

POLIANTHES, in botany, a genus of plants, with a monopetalous, funnel-faſhioned flower; and a roundiſh capſule for its fruit, with a great many ſemi-orbiculated ſeeds.

POLISHER, or BURNISHER, among mechanics, an inſtrument for poliſhing and burniſhing things proper to take a poliſh. The gilders uſe an iron-poliſher to prepare their metals before gilding, and the blood-ſtone to give them the bright poliſh after gilding.

The poliſher uſed by the makers of ſpurs, and bits, &c. is partly iron, partly ſteel, and partly wood; it conſiſts of an iron-bar with a wooden handle at one end, and a hook at the other, to faſten it to another piece of wood held in the vice, while the operator is at work. In the middle of the bow, withinſide, is what is properly called the poliſher, being a triangular piece of ſteel with a tail, whereby it is riveted to the bow.

The poliſhers, among cutlers, are a kind of wooden wheels made of walnut-tree, about an inch thick, and of a diameter at pleaſure, which are turned round by the great wheel; upon theſe they ſmooth and poliſh their work with emery and putty.

The poliſhers for glaſs conſiſt of two pieces of wood; the one flat, covered with old hat; the other long and half-round, faſtened on the former, whoſe edge it exceeds on both ſides by ſome inches, which ſerve the workmen to take hold of, and to work backwards and forwards by.

The poliſhers uſed by ſpectacle-makers, are pieces of wood a foot long, ſeven or eight inches broad, and an inch and a half thick, covered with old beaver-hat, whereon they poliſh the ſhell and horn-frames their ſpectacle-glaſſes are to be ſet in.

POLISHING, in general, the operation of giving a gloſs or luſtre to certain ſubſtances, as metals, glaſs, marble, &c.

The operation of poliſhing optic-glaſſes, after being properly ground, is one of the moſt difficult points of the whole proceſs. See GLASS and GRINDING.

Before the poliſhing is begun, it is proper to ſtretch an even well-wrought piece of linnen over the tool, duſting thereupon ſome very fine tripoli. Then taking the glaſs in your hand, run round forty or fifty times upon the tool, to take off the roughneſs of the glaſs about the border of it. This cloth is then to be removed, and the glaſs to be poliſhed upon the naked tool, with a compound powder made of four parts tripoli mixed with one of fine blue vitriol; ſix or eight grains of which mixture is ſufficient for a glaſs five inches broad. This powder muſt be wetted with eight or ten drops of clear vinegar, in the middle of the tool; being firſt mixed and ſoftened thoroughly with a very fine ſmall mullet. Then with a nice bruſh, having ſpread this mixture thinly and equably upon the tool, take ſome very fine tripoli, and ſtrow it thinly and equably upon the tool ſo prepared; after which take the glaſs to be poliſhed, wiped very clean, and apply it on the tool, and move it gently twice or thrice in a ſtraight line backwards and forwards; then take it off, and obſerve whether the marks of the tripoli, ſticking to the glaſs, be equably ſpread over the whole ſurface thereof; if not, it is a ſign that either the tool or glaſs is too warm; in which caſe you muſt wait a while and try again, till you find the glaſs takes the tripoli every where alike. Then you may begin to poliſh boldly, there being no danger of ſpoiling the figure of the glaſs, which in the other caſe would infallibly happen. This is Mr. Huygens's method; but it ought to be obſerved, that almoſt every operator has a peculiar one of his own, and of which ſome of them make a mighty ſecret.

Sir Iſaac Newton no where expreſsly deſcribes his method of poliſhing optic-glaſſes; but his method of poliſhing reflecting metals he thus deſcribes in his Optics. He had two round copper plates, each ſix inches in diameter, the one convex, the other concave, ground very true to one another. On the convex one he ground the object-metal, or concave which was to be poliſhed, till he had taken the figure of the convex, and was ready for a poliſh. He then pitched over the convex very thinly, by dropping melted pitch upon it, and warming it to keep the pitch ſoft, whilſt he ground it with the concave copper wetted to make it ſpread evenly all over the convex, till it was no thicker than a groat-piece; and after the convex was cold, he ground it again, to give it as true a figure as poſſible. He then ground it with very fine putty, till it made no noiſe; and then upon the pitch he ground the object-metal with a briſk motion for two or three minutes; when laying freſh putty upon the pitch, he ground it again till it had done making a noiſe, and afterwards ground the object-metal upon the pitch as before: and this operation he repeated, till the metal was perfectly poliſhed.

POLITICAL, in general, ſomething relating to policy or government.

POLITICAL *Arithmetic* is the application of arithmetical calculations to political ſubjects, as the public revenues, number of people, extent and value of lands, taxes, trade, manufactures, &c. of any commonwealth.

The calculations of this kind, which Sir William Petty attempted, Dr. Davenant gives ſome good reaſons why many of his numbers are not to be entirely depended on; and therefore he advances others of his own founded on the obſervations of Mr. Greg. King.

The land of England, he ſays, is 39 millions of acres; the number of people about 5,545,000, increaſing about 9,000 every year, allowance being made for plagues, &c. wars, ſhipping, plantations. The people in London he reckons at 530,000; thoſe in the other cities and market-towns 870,000; and thoſe in the villages and hamlets at 4,100,000; the yearly rent of the land he accounts to be 10,000,000 l. that of the houſes and buildings 2,000,000 l. per annum; the produce of all kinds of grain he reckons to be worth 9,075,000 l. in a moderately plentiful year; the rent of the corn-lands annually 2,000,000 l. and their net produce above 9,000,000 l. the rent of the paſtures, meadows, woods, foreſts, commons, heaths, &c. 7,000,000 l. The annual produce in butter, cheeſe, and milk, about 2,500,000 l. The value of the wool, yearly ſhorn, about 2,000,000 l. Of horſes yearly bred, about 250,000 l. Of the fleſh yearly conſumed about 3,350,000 l. Tallow and hides about 600,000 l. Hay yearly conſumed by horſes 1,300,000 l. By other cattle, 1,000,000 l. The timber yearly felled for building, 500,000 l. Wood yearly burnt, &c. 500,000 l. The land of England is now about ſeven acres one quarter to each inhabitant. The value of the wheat, rye, and barley, neceſſary for the ſuſtenance of England, at leaſt 6,000,000 l. per annum. The value of the woollen manufacture made here is about 8,000,000 l. per annum, and our exports of all kinds of woollen manufactures above 2,000,000 l. per annum. The annual income of England, on which the people live, and out of which taxes of all kinds are paid, is now about 43,000,000 l. that of France 81,000,000 l. and Holland 18,250,000 l.

Major Grant, in his obſervations on the bills of mortality, computes that there are 39,000 ſquare miles of land

land in England; that in England and Wales there are 4,600,000 ſouls; that the people of London are about 640,000, and one fourteenth part of the people of England. That in England and Wales are about 10,000 pariſhes, and 25 millions of acres, being about 4 acres to every head. That but 64 out of a hundred of the children born are living at 6 years old; but 40 at 16; but 25 at 26; but 16 at 36; but 10 at 46; but 6 at 56; but 3 at 66; but 1 at 76. And that London doubles itſelf in about 64 years.

Let p repreſent the number of perſons in being at any given time, and put $\frac{p}{s}$ for the increaſe at the end of the firſt year; then $p+\frac{p}{s}$ will expound the number of perſons living at the end of the firſt year, and conſequently $\frac{p}{s}+\frac{p}{ss}$ will be the increaſe in the ſecond year; therefore the number of perſons in being at the expiration of the ſecond year will be denoted by $p+\frac{p}{s}+\frac{p}{s}+\frac{p}{ss}$, or $p+\frac{2p}{s}+\frac{p}{ss}$; at the end of the third year there will be $p+\frac{3p}{s}+\frac{3p}{ss}+\frac{p}{s^3}$, perſons living; at the end of the fourth year $p+\frac{4p}{s}+\frac{6p}{ss}+\frac{4p}{s^3}+\frac{p}{s^4}$; and at the end of the fifth year, $p+\frac{5p}{s}+\frac{10p}{s^2}+\frac{10p}{s^3}+\frac{5p}{s^4}+\frac{p}{s^5}$; from whence the law of continuation becomes manifeſt, the coefficients of p being the unciæ of a binomial raiſed to that power, whoſe exponent is the propoſed number of years; and therefore the number of people in being at the expiration of 11 years will be expreſſed by $p+n\times\frac{p}{s}+n\times\frac{n-1}{2}\times\frac{p}{s^2}+n\times\frac{n-1}{2}\times\frac{n-2}{3}\times\frac{p}{s^3}+n\times\frac{n-1}{2}\times\frac{n-2}{3}\times\frac{n-3}{4}\times\frac{p}{s^4}$, &c.

Sir William Petty, in his diſcourſe about duplicate proportion, ſays, that it is found by experience that there are more perſons living between 16 and 26 than of any other age; and thence he infers that the ſquare roots of every number of men's ages under 16, ſhew the proportion of the probability of ſuch perſons reaching the age of 70.

Thus, it is 4 times more likely that one of 16 years of age lives to be 70, than a child of one year old; it is thrice as probable that one of 9 years lives to be 70, as ſuch a new-born child, &c. That the odds is 5 to 4, that one of 25 dies before one of 16; and ſo on as the ſquare roots of the ages.

Dr. Halley has made a very exact eſtimate of the degrees of the mortality of mankind, from a curious table of the births and burials at the city of Breſlau, the capital of Sileſia, with an attempt to aſcertain the price of annuities upon lives. See the *Philoſophical Tranſactions*.

From the whole he makes the two following very good obſervations: 1. How unjuſtly we uſe to complain of the ſhortneſs of our lives; for that it appears that one half of thoſe that are born, do not live above 17 years; and, 2. That the growth and increaſe of mankind is not ſo much ſtinted by any thing in the nature of the ſpecies, as it is from the curious difficulty moſt people make of venturing on the ſtate of marriage; and, therefore, that celibacy ought to be every way diſcouraged by all wiſe governments; and thoſe who have numerous families of children encouraged by good laws, ſuch as the *jus trium liberorum*, &c. among the Romans.

POLITICS, the firſt part of œconomy, conſiſting in the well governing and regulating the affairs of a ſtate, for the maintenance of the public ſafety, order, tranquility, and morals.

POLITY, or POLICY, πολιτεια, denotes the peculiar form and conſtitution of the government of any ſtate or nation; or the laws, orders, and regulations, relating thereto.

POLL, a word uſed in ancient writings for the head: hence to poll, is either to vote or to enter down the names of thoſe perſons who give in their votes at an election.

POLL-MONEY, a capitation or tax impoſed by the authority of parliament on the head or perſon either of all indifferently, or according to ſome known mark of diſtinction.

POLLARD, among hunters, a ſtag which has caſt his horns.

POLLARD, or POLLENGER, in agriculture, ſignifies a tree that has been frequently polled, or lopped.

POLLEX, in anatomy, denotes either the thumb or great toe, according as either manus or pedis is added to it.

POLLING, among gardeners, the operation of ſpreading the worm caſts all over the walks, by means of long aſh-poles; which is ſaid to be very beneficial to the graſs of the walks.

POLLUX, in aſtronomy, a fixed ſtar of the ſecond magnitudein the conſtellation of Gemini, or the Twins. Its longitude is 19°. 56′. 29″ of ♋, and its latitude 6°. 39′. 27″ N.

POLVERINE, in commerce, the aſhes of the herb hali, preſerved for the uſe of making glaſs.

POLYADELPHIA, in botany, a claſs of plants, the eighteenth in order, whoſe ſtamina are connected together at their baſes into ſeveral ſerieſes.

The plants of this claſs are ſubdvided into orders according to the number of their ſtamina: thus the polyadelphia pentandria contain five ſtamina; and the polyadelphia icoſandria and polyandria contain twenty or more ſtamina.

POLYANDRIA, in botany, a claſs of plants, the thirteenth in order, with hermaphrodite-flowers, and a large number of ſtamina, or male parts in each; theſe always exceed the number of twelve, and grow on the receptacle of the future ſeeds. The genera of this claſs being numerous, are arranged under different orders; the firſt of which is called polyandria monogynia, as containing only one ſtyle; the ſecond, polyandria digynia, as having two ſtyles; and ſo of the polyandria trigynia, tetragynia, pentagynia, &c. from their containing three, four, five, &c. ſtyles.

POLYANTHUS, in botany, a beautiful garden flower of the primroſe kind; the varieties of which are innumerable, being produced from ſeeds, which ſhould be ſown in February, either in borders, boxes, or pots, and ſhould have an eaſt aſpect, ſo as to be ſhaded from the heat of the day; in May they will be fit to be planted out for good, which ſhould be in a ſhady border of ſtrong rich earth, at about ſix inches aſunder, and the ſucceeding ſpring they will ſhew their bloſſoms, when their goodneſs may be judged of.

POLYCHREST, in pharmacy, a medicine that ſerves for many uſes, or that cures many diſeaſes.

Sal POLYCHREST, a compound ſalt made of equal parts of ſalt-petre and ſulphur, laid on a red-hot crucible.

POLYGAMIA, in botany, a claſs of plants, the twenty-third in order, the characters of which are, that they have flowers of different ſtructure; ſome having male-flowers, others female ones, and others hermaphrodite.

Of this claſs there are two orders, or ſubdiviſions; whereof the firſt comprehends ſuch polygamious plants as contain the different kinds of flowers on different parts of the ſame plant; and hence called polygamia monoecia: ſuch are the muſa, veratum, celtis, parietaria, &c. The ſecond order conſiſts of ſuch polygamious plants, as have their different flowers, not on the ſame individual plant, but on different plants of the ſame ſpecies: ſuch are the chamærops, fraxinus, rhodiola, &c.

POLYGAMY, a plurality of wives or huſbands, in the poſſeſſion of one man or woman, at the ſame time.

POLYGLOTT, πολυγλοττος, among divines and critics, chiefly denotes a bible printed in ſeveral languages. In theſe editions of the Holy Scriptures, the text in each language is ranged in oppoſite columns. The firſt polyglott bible was that of cardinal Ximenes printed in 1517, which contains the Hebrew text, the Chaldee

paraphraſe on the Pentateuch, the Greek verſion of the LXX. and the ancient Latin verſion. After this, there were many others, as the bible of Juſtiniani, biſhop of Nebio, in Hebrew, Chaldee, Greek, Latin, and Arabic; the pſalter by John Potken, in Hebrew, Greek, Ethiopic, and Latin; Plantin's polyglott bible, in Hebrew, Chaldee, Greek, and Latin, with the Syriac verſion of the New Teſtament; M. le Jay's bible in Hebrew, Samaritan, Chaldee, Greek, Syriac, Latin, and Arabic; Walton's polyglott, which is a new edition of Le Jay's polyglott, more correct, extenſive, and perfect, with ſeveral new Oriental verſions, and a large collection of various readings, &c.

POLYGON, in geometry, a figure whoſe perimeter conſiſts of more than four ſides and angles.

The word is compounded of the Greek, πολυς, many, and γωνια, angle.

If the ſides and angles be equal, the figure is called a regular polygon. Polygons of five ſides are called pentagons; of ſix, hexagons; of ſeven, heptagons; of eight, octagons, &c.

General Properties of POLYGONS.—Every polygon may be divided into as many triangles as it hath ſides.—

If you take a point, as *a* (plate CII. *fig.* 7.) any where within the polygon, and from thence draw lines to every angle *ab*, *ac*, *ad*, &c. they ſhall make as many triangles as the figure hath ſides. Thus, if the polygon hath ſix ſides (as in the figure above) the double of that is twelve, from whence take four, and there remains eight: I ſay, that all the angles *b*, *c*, *d*, *e*, *f*, *g*, of that polygon, taken together, are equal to eight right angles.—For the polygon, having ſix ſides, is divided into ſix triangles; and the three angles of each by 1. è 32 Eucl. are equal to two right ones; ſo that all the angles together make twelve right ones: but each of theſe triangles hath one angle in the point *a*, and by it they complete the ſpace round the ſame point; and all the angles about a point are known to be equal to four right ones, wherefore thoſe four taken from twelve leave eight, the ſum of the right angles of the hexagon.

So it is plain the figure hath twice as many right angles, as it hath ſides, except four. Q. E. D.

Every polygon circumſcribed about a circle is equal to a rectangled-triangle, one of whoſe legs ſhall be the radius of the circle, and the other the perimeter (or ſum of all the ſides) of the polygon.

Hence every regular polygon is equal to a rectangled triangle, one of whoſe legs is the perimeter of the polygon, and the other a perpendicular drawn from the center to one of the ſides of the polygon.

And every polygon circumſcribed about a circle is bigger than it; and every polygon inſcribed is leſs than the circle, as is manifeſt, becauſe the thing containing is always leſs than the thing contained.

The perimeter of every polygon circumſcribed about a circle is greater than the circumference of that circle, and the perimeter of every polygon inſcribed is leſs. Hence, a circle is equal to a right-angled triangle whoſe baſe is the circumference of the circle, and its height the radius of it.

For this triangle will be leſs than any polygon circumſcribed, and greater than any inſcribed; becauſe the circumference of the circle, which is the baſe of the triangle, is greater than the compaſs of any inſcribed, therefore it will be equal to the circle. For, if this triangle be greater than any thing that is bigger than the circle, and leſſer than any thing that is leſſer than the circle, it follows that it muſt be equal to the circle. This is called the quadrature or ſquaring of the circle; that is, to find a right-lined figure equal to a circle, upon a ſuppoſition that the baſis given is equal to the circumference of the circle: but actually to find a right line equal to the circumference of a circle is not yet diſcovered geometrically.

To find the Area of a regular POLYGON.—Multiply a ſide of the polygon, as AB (*fig.* 8.) by half the number of the ſides, e. gr. the ſide of a heptagon by $2\frac{1}{2}$. Again, multiply the product by a perpendicular let fall from the center of the circumſcribing circle to the ſide AB; the product is the area required. See AREA.

Thus ſuppoſe A B 54, and half the number of the ſides $2\frac{1}{2}$, the product or ſemi-diameter is 135. Suppoſing the perpendicular F*g* 29, the product of theſe two, 3915, is the area of the pentagon required.

To find the Area of an irregular POLYGON, or *Trapezium.*—Reſolve it into triangles, and find the ſeveral area's of the ſeveral triangles; the ſum of this is the polygon required.

To find the Sum of all the Angles in any POLYGON.

Multiply the number of ſides by 2, and from the product ſubtract 4, the remainder multiplied by 90° gives the ſum required.

Thus in a pentagon 90° being multiplied by 6, or $2 \times 5 - 4$, gives 540, the ſum of the angles of a pentagon.

Hence, if the ſum found be divided by the number of ſides, the quotient will be the angle of a regular polygon.

POLYGON, in fortification, denotes the figure of a town, or other fortreſs.

POLYGONAL *Numbers*, in algebra, are ſuch as ariſe from a continual addition of a rank of numbers in arithmetical progreſſion, beginning from unity; ſo called by reaſon the units of which it conſiſts may be diſpoſed in ſuch a manner as to repreſent the figure of ſeveral equal ſides and angles.

Polygonal numbers are divided, with reſpect to the number of their terms, into, triangular, which are thoſe whoſe number of terms is 1; quadrangular or ſquare, where it is 2; pentagonal, where 3; hexagonal, where 4; heptagonal, where 5; octagonal, where 6, &c.

The geneſis of the ſeveral kinds of polygonal numbers from the ſeveral arithmetical progreſſions, may be conceived from the following examples:

Arithmetical progreſſion —	1.	2.	3.	4.	5.	6.	7.
Triangular numbers —	1.	3.	6.	10.	15.	21.	28.
Arithmetical progreſſion —	1.	3.	5.	7.	9.	11.	13.
Square numbers — —	1.	4.	9.	16.	25.	36.	49.
Arithmetical progreſſion —	1.	4.	7.	10.	13.	16.	19.
Pentagonal numbers —	1.	5.	12.	22.	35.	51.	70.
Arithmetical progreſſion —	1.	5.	9.	13.	17.	21.	25.
Hexagonal numbers — —	1.	6.	15.	28.	45.	66.	91.

Polygonal numbers may be thus generally repreſented. Let *d* be the common difference of the terms in any arithmetical progreſſion, beginning with an unit, and call the number of terms *n*; then will 1, $2 + d$, $\overline{2 + 2d} \times \frac{1}{2}$, $\overline{2+3d} \times \frac{1}{2}$, $\overline{2+4d} \times \frac{1}{2}$, &c. to *n* terms be the polygonal number correſponding to the propoſed arithmetical progreſſion.

Side of a POLYGONAL *Number* is the number of terms of the arithmetical progreſſion that compoſe it; and the number of angles is that which ſhews how many angles that figure has, whence the polygonal number takes its name.

The number of angles, therefore, in triangular numbers, is 3, in tetragonal 4, in pentagonal 5, &c. conſequently the number of angles exceeds the common difference of terms by two.

POLYGONATUM, Solomon's ſeal, in botany, is ranked by Linnæus among the convallaria.

The root of this plant is a famous vulnerary; for being applied in form of a poultice, it not only heals freſh wounds, but takes away the marks of bruiſes, &c.

POLYGONUM, knot-graſs, in botany, a genus of plants, the flower of which conſiſts of a ſingle imperforate petal, divided into five oval ſegments at the limb: there is no pericarpium, the ſeeds being contained in the cup.

An infuſion of this plant is a valuable aſtringent medicine in hæmorrhages of all kinds.

POLYGYNIA, among botaniſts, denotes an order or ſubdiviſion of a claſs of plants; comprehending ſuch plants of that claſs, as have a great number of piſtils, or female organs of generation. See PISTIL and GENERATION.

POLYHEDRON, in geometry, a body compriſed under many rectilinear ſides or planes.

If the ſides of a polyhedron be regular polygons, all ſimilar and equal, it becomes a regular body, and may be inſcribed in a ſphere. See SPHERE.

POLYHISTOR, a perſon of great and various erudition; whence

POLYMATHY, πολυμαθια, denotes the knowledge of many arts and ſciences.

POLYMYTHY, πολυμυθια, in poetry, a fault in an epic poem, when, inſtead of a ſingle mythos, or fable, there is a multiplicity of them.

POLYNOMIAL, or MULTINOMIAL, in algebra. See MULTINOMIAL.

POLYOPTRUM, in optics, a glaſs through which objects appear multiplied, but diminiſhed.

POLYPE, or POLYPUS, in zoology, a ſmall freſh-water inſect, of a cylindric figure, but variable, with very long tentacula.

There is ſcarce an animal in the world more difficult to deſcribe than this ſurpriſing inſect; it varies its whole figure at pleaſure, and is frequently found beſet with young in ſuch a manner as to appear ramoſe and divaricated; theſe young ones adhering to it in ſuch a manner as to appear parts of its body.

When ſimple, and in a moderate ſtate as to contraction or dilatation, it is oblong, ſlender, pellucid, and of a pale-reddiſh colour: its body is ſomewhat ſmaller towards the tail, by which it affixes itſelf to ſome ſolid body; and larger towards the other extremity, where it has a large opening, which is the mouth, around which are the tentacula, which are eight in number, and one uſually extended to about half the length of its body. By means of its tentacula, or arms, as they are commonly called, expanded into a circle of more than half a foot diameter, the creature feels every thing that can ſerve it for food; and ſeizing the prey with one of them, calls in the aſſiſtance of the others, if neceſſary, to conduct it to its mouth.

The production of its young is different from the common courſe of nature in other animals; for the young one iſſues from the ſide of its parent in the form of a ſmall pimple, which lengthening every hour, becomes, in about two days, a perfect animal, and drops from off its parent to ſhift for itſelf; but before it does this, it has often another growing from its ſide; and ſometimes a third from it, even before the firſt is ſeparated from its parent; and what is very extraordinary is, that there has never yet been diſcovered among them any diſtinction of ſex, or appearance of copulation; every individual of the whole ſpecies being prolific, and that as much if kept ſeparate, as if ſuffered to live among others. But what is even ſtill more ſurpriſing, is the reproduction of its ſeveral parts when cut off, for when cut into a number of ſeparate pieces, it becomes in a day or two ſo many diſtinct and ſeparate animals; each piece having the property of producing a head and tail, and the other organs neceſſary for life, and all the animal functions. There are ſeveral other ſpecies of this animal, moſt of which are found in our ditches. Plate CII. *fig.* 9. repreſents a cluſter-polype, extending itſelf; and *fig.* 10. the ſame polype after being ſoaked in water, and the tentacula, or branches, laid ſtraight.

POLYPODY, *Polypodium*, in botany, a plant with long leaves iſſuing from the root, divided on both ſides, down to the rib, into a number of oblong ſegments broadeſt at the baſe: it has no ſtalk, or manifeſt flower; the ſeeds are a fine duſt, lying on the backs of the leaves, in roundiſh ſpecks, which are diſpoſed in rows parallel to the rib: the roots are long and ſlender, of a reddiſh brown colour on the outſide, greeniſh within, full of ſmall tubercles, which are reſembled to the feet of an inſect, whence the name of the plant. It grows in the clefts of old walls, rocks, and decayed trees: that produced on the oak has been generally accounted the beſt, though not ſenſibly different from the others. It is found green at all ſeaſons of the year.

The leaves of polypody have a weak ungrateful ſmell, and a nauſeous ſweet taſte, leaving a kind of roughneſs and ſlight acrimony in the mouth. This root is ſuppoſed to be aperient, reſolvent, and expectorant: it was formerly ranked among the purgatives, but operates ſo weakly, a decoction of an ounce or two ſcarcely moving the belly, that it has long been expunged from that claſs: the preſent practice pay very little regard to it in any intention.

POLYPUS, or POLYPUS *of the Heart*, in medicine, a maſs compoſed of various pellicles and fibres generated in the heart and large veſſels.

Polypuſes are generally found in acute as well as chronic diſeaſes. Their principal ſeat is in the heart, pulmonary artery, and the aorta. They chiefly attack the ſanguine conſtitutions, and ſuch as have ſmall veſſels and ſoft fibres; thoſe who are of a ſedentary life, who drink little, or are free in the uſe of acid wines and ſpirituous liquors, or who eat great ſuppers.

The beginning of a polypus may be known by a compreſſion of the breaſt, a fixed pain about the heart; and when it increaſes, there is a frequent palpitation of the heart, from very ſlight cauſes; the pulſe is ſtrangely unequal, and often intermits; on a violent motion of the body, or the patient's taking a medicine which diſturbs the blood, or on the mind's being violently affected, there ariſes a ſhortneſs of breath, and an incredible anxiety of the heart. Laſtly, there are frequent faintings, without any evident cauſe, or only from a certain poſition of the body; and if the blood is let fall into hot water, it will congeal like jelly, and cleave into white filaments.

A polypus frequently produces the moſt dreadful diſeaſes, and even ſudden death. In the cure, an exact regimen and diet muſt be made uſe of, with frequent exerciſe, and motions of the body. Etmuller ſays, that when it proceeds from the ſcurvy, or hyſteric affection, it is curable; and that the cure is to be attempted with chalybeate and coraline medicines, with cinnabar, volatiles, preparations of amber, and all antiſpaſmodics.

POLYPUSES *of the Lungs* are viſcous excretions of the ſmall glands, formed in the deeper branches of the aſpera arteria, and frequently miſtaken for pieces of the blood-veſſels or lungs.

POLYPUS *of the Noſe*, a fleſhy excreſcence, in the inſide of the noſtrils, which is of various ſizes, and of different conſiſtencies; ſometimes theſe excreſcences are ſoft, ſometimes they are capable of elongation, and at other times they turn hard and rigid. In their beginning they are generally ſmall, and advance gradually; ſome are concealed within the noſe, and others hang out of that organ down to the lips, while others deſcend backwards through the apertures by which we draw the air through the noſtrils, and not only occaſion great difficulty in ſpeaking and ſwallowing, but ſometimes almoſt ſtrangle the patient. They are generally attended with pain; but ſome, which are hard and livid, are extremely painful. They have generally but one root; but ſometimes they have many.

Heiſter mentions a method of extirpating a polypus, by conveying a ligature round its baſis, and tying it faſt: but when the roots are inacceſſible, he adviſes taking hold of it with a crooked forceps, and twiſting it till the roots are broken. If the flux of blood is not conſiderable, the ſurgeon may ſuffer it to continue till it ceaſes of itſelf; but if it is profuſe and dangerous, it is to be ſtopped with doſſils dipt in ſtyptic liquors and powders, thruſt up the noſtrils. Mr. Le Dran cured a polypus of the noſe, which he could not extract wholly, in the following manner: he introduced one end of a large ſeton put on the point of the fore-finger of the left-hand into the patient's mouth, till he brought it behind the velum pendulum; then ſliding a pair of thin crooked forceps into the affected noſtril, catched hold of the ſeton, after covering what was to be introduced into the noſe with a ſuppurant medicine. While he drew the cord, he endeavoured to preſerve the velum pendulum from being hurt, by introducing his fore-finger into the mouth, and ſupporting the cord upon it. He continued the ſuppurant till he was ſenſible by the patient's breathing freely thro' the noſtril, that the remains of the polypus was deſtroyed, and then he injected deſiccatives to cauterize the ulcer.

POLYPYRENEOUS, an appellation given to fruits containing ſeveral kernels, or ſeeds.

POLYSCOPE, in optics, the ſame with polyhedron. See POLYHEDRON.

POLYSPASTON, in mechanics, a machine conſiſting of an aſſemblage of ſeveral pullies; for the nature and force of which, ſee PULLEY.

POLYSPERMOUS, among botaniſts, ſuch plants as have

have more ſeeds than four ſucceeding each flower, without any certain order.

POLYSYLLABLE, in grammar, a word conſiſting of more ſyllables than three; for when a word conſiſts of one, two, or three ſyllables, it is called a monoſyllable, diſſyllable, and triſyllable.

POLYSYNDETON, in grammar and rhetoric, a figure whereby a redundance of conjunctions, eſpecially copulative ones, is uſed.

POLYTHEISM, in matters of religion, the doctrine or belief of a plurality of gods.

POMATUM, an ointment made thus: Take of freſh hog's lard, and beat it into cream with roſe water, and ſcent it with oil of lemons, thyme, or the like. Pomatums are alſo occaſionally perfumed with the odours of jeſſamines, oranges, jonquils, tuberoſes, &c. They are principally uſed for pimples, and foulneſſes of the ſkin.

POMEGRANATE, *Malus Punica*, in botany, a prickly tree or ſhrub; with long narrow leaves; deep red pentapetalous flowers ſet in bell ſhaped cups of the ſame colour; producing fruit about the ſize of an orange, which conſiſts of a thick tough rhind, externally browniſh and internally yellow, with a juicy pulp and numerous ſeeds in cells like a honey-comb. It is a native of the ſouthern parts of Europe, and rarely brings its fruit to full perfection in this climate.

The flowers of this tree are mild aſtringents, ſimilar to thoſe of the wild pomegranate or balauſtine, which laſt are preferred only on account of their being larger. See BALAUSTINE.

The pulp of the fruit, when in perfection, is of a grateful dulco-acid taſte, and of the ſame general qualities with the other *fructus horæi*. The rhind of the fruit is moderately aſtringent, and in this intention is now and then directed, under the names of *cortex granati*, *malicorium*, *pſidium*, and *ſidium*, both in the London and Edinburgh college.

POMEIS, in heraldry, are green roundles, ſo called by the Engliſh heralds, who give diſtinct names to the different coloured roundles.

POMMÉ, or POMMETTÉ, in heraldry, is a croſs with one or more balls or knobs at each of the ends.

POMMEL, or PUMMEL, in the manege, a piece of braſs, or other matter, at the top and in the middle of the ſaddle-bow.

POMMEL is alſo a round ball of ſilver, ſteel, or the like, fixed at the end of the guard, or graſp of a ſword, to ſerve, in ſome meaſure, as a counterpoiſe.

POMPHOLYX, in the materia medica, ſemi-metallic recrement, very nearly allied in its nature to tutty; being a kind of flowers of zinc or calamine, ſublimed higher than tutty, and carrying leſs of any metalline particles with it.

POMPION, in botany. See CUCURBITA.

POMUM ADAMI. See ADAMI *Pomum*.

POND, or FISH-POND. See FISH-POND.

PONIARD, a little pointed dagger, very ſharp-edged; it is now little uſed, except among aſſaſſins and at the theatres.

PONS VAROLI, in anatomy, the upper part of a duct in the third ventricle of the brain.

PONTIFEX, PONTIF, or HIGH-PRIEST, a perſon who has the ſuperintendance and direction of divine worſhip, as the offering of ſacrifices and other religious ſolemnities. The Romans had a college of pontifs, and over theſe a ſovereign pontif, or *pontifex maximus*, inſtituted by Numa, whoſe function it was to preſcribe the ceremonies each god was to be worſhipped withal, compoſe the rituals, direct the veſtals, and for a good while to perform the buſineſs of augury, till, on ſome ſuperſtitious occaſion, he was prohibited intermeddling therewith. The office of the college of pontifs was to aſſiſt the high-prieſt in giving judgment in all cauſes relating to religion, inquiring into the lives and manners of the inferior prieſts, and puniſhing them if they ſaw occaſion, &c. The Jews too had their pontifs; and among the Romaniſts, the pope is ſtill ſtyled the ſovereign pontif.

PONTIFICATE is uſed for the ſtate or dignity of a pontif, or high-prieſt; but more particularly, in modern writers, for the reign of a pope.

PONTON, or PONTOON, in war, denotes a little floating bridge made of boats and planks. The ponton is a machine conſiſting of two veſſels, at a little diſtance, joined by beams, with planks laid acroſs for the paſſage of the cavalry, the cannon, infantry, &c. over a river, or an arm of the ſea, &c. The late invented ponton is of copper furniſhed with an anchor, &c. to fix it. To make a bridge, ſeveral of theſe are diſpoſed two yards aſunder, with beams acroſs them; and over thoſe are put boards or planks. They are alſo linked to each other and faſtened on each ſide the river by a rope run through a ring in each of their heads, and fixed to a tree or ſtake on either ſhore: the whole makes one firm uniform bridge, over which a train of artillery may paſs.

PONT VOLANT, flying bridge. See the article BRIDGE.

POOL is properly a reſervoir of water ſupplied with ſprings, and diſcharging the overplus by ſluices, defenders, weirs, and other cauſeways.

Mill POOL, a ſtock of water by whoſe force, &c. the motion of a mill is effected.

POOP, the aftmoſt or hindmoſt deck of a ſhip. See DECK.

POOR, in law, an appellation given to all perſons who are in ſo low and mean a condition as that they either are, or may become, a burden to a pariſh.

Hence under the term poor, may be included thoſe who are ſo through impotency; as the aged, the blind, the lame, the fatherleſs and motherleſs, perſons labouring under ſickneſs, or who are idiots, lunatics, &c. for all whom the overſeers of the poor are obliged to provide.

There is alſo another kind of poor, on account of caſualties and misfortunes; as decayed houſe keepers, and thoſe who have been ruined either by fire, water, robbery, or loſſes in trade, &c. all of whom, being able, are to be ſet to work, and otherwiſe relieved by the pariſh; and it is the ſame with reſpect to poor perſons over-charged with children, diſabled labourers, &c. As for vagabonds, ſtrumpets, and other thriftleſs ſorts of poor, they may and ought to be ſent to houſes of correction, and put to hard labour whereby they may be maintained: yet if even theſe fall ſick there, or their work is not ſufficient to maintain them, in that caſe there muſt be an allowance by the overſeers for their ſupport.

Before the reign of queen Elizabeth, we had few or no laws for the relief of the poor of this kingdom; but then a ſtatute was made, enacting, that the churchwardens of every pariſh, and two or more houſholders, are to be nominated and appointed yearly in Eaſter week by two juſtices of the peace, as overſeers of the poor; which ſaid overſeers ſhall meet once a month at the pariſh church, there to conſider of proper ways to relieve the poor, &c. And with the aſſent of the juſtices they may make a rate on every inhabitant of the pariſh, and occupier of lands, houſes, tithes, as alſo perſonal eſtate, to raiſe a ſtock for employing of the poor, relieving the impotent, and others not able to work, the placing poor children out apprentices, and erecting cottages for poor perſons, &c. The overſeers are likewiſe to give a true account to two juſtices within four days after the end of the year, or forfeit twenty ſhillings; and where theſe officers are not appointed, the juſtices incur five pounds penalty, 43 Eliz. c. 2. By this ſtatute the father or grandfather, and mother or grandmother, or even children of poor impotent perſons, where they are of ability, are obliged to relieve ſuch poor, according to ſuch rates as juſtices of peace in their ſeſſions ſhall appoint, under a penalty of twenty ſhillings a month for every failure therein.

It has been adjudged that a grandfather or father-in-law, that is married to the grandmother, or mother, is within this ſtatute; and if the father of any children leaves the pariſh, and there is a grandfather to be found, in caſe he is able to do it, it is ſaid he ſhall be chargeable with the keeping of the children, and not the pariſh where they are.

By a late act, the churchwardens and overſeers of the poor, where a wife or child is left upon a pariſh, by perſons who have eſtates or effects which might maintain them, on a warrant of two juſtices, may ſeize the goods and

and receive the rents of the huſband or father, in order to ſupport ſuch wife or child. 5 Geo. 1. c. 8.

Every pariſh is generally to keep and maintain its own poor; and in caſe any poor perſons demand relief, that are not pariſhioners, they ought to be removed to their proper pariſhes, and there be relieved; for that pariſh the poor were laſt legally ſettled at, is deemed the place that ſhall provide for them. And where perſons are removed by warrant or order of juſtices of peace, they ſhall be received by the churchwardens and overſeers whither ſent, on pain of forfeiting five pounds to the poor of the pariſh whence conveyed, to be levied by diſtreſs and ſale of goods, &c. Nevertheleſs a ſick perſon ſhould not be ſent out of the pariſh where he is, ſo as farther to endanger his health; in which caſe, if the juſtices grant a warrant to remove him, it will be a miſdeameanor in ſuch juſtices.

As to the ſettlement, which entitles poor perſons to relief, it is acquired ſeveral ways, viz. on account of birth, in the caſe of baſtards, vagrants, &c. by continuance for forty days in a pariſh, after public notice given to overſeers, &c. or coming into a pariſh and renting ten pounds a year eſtate, or executing any public annual office, paying a ſhare to the pariſh taxes, &c. Alſo ſervants acquire this title, by ſerving a year in any pariſh; and perſons bound apprentices: and though a perſon be only a lodger, it is held that his ſervant may gain a ſettlement by ſerving a year in any pariſh.

The wife of a perſon is to be ſent to, and ſettled with her huſband, even though he ſhould be only a ſervant; and as generally all children are to their parents. It is however provided, that poor perſons ſhall have the liberty to go to any pariſh, by virtue of a certificate from churchwardens and overſeers, atteſted by two witneſſes, and ſubſcribed by two juſtices of peace, owning them to be pariſhioners; and likewiſe agreeing, when they become chargeable, to receive them again.

It is alſo ordained, that there ſhall be kept in every pariſh a book, wherein the names of all ſuch perſons, as receive any relief, ſhall be regiſtered, with the occaſion thereof; and the pariſhioners are once a year, or oftener, to have a meeting for that purpoſe, when the ſaid liſt ſhall be examined into, by calling over the perſons, and enquiring into the reaſons why they are relieved; and at this time a new liſt muſt be made of thoſe thought fit to be allowed to receive collection; and the perſons thus receiving relief, ought to wear badges on their right ſhoulders, alſo no others ſhall have any benefit, unleſs by order under the hand of one juſtice, &c. 3 & 4 W. & M. c. 11. And no juſtice of peace ſhall make any ſuch order in behalf of any poor perſon, till oath is made of reaſonable cauſe for it, and that he was refuſed to be relieved by the overſeers, &c. And ſuch perſon ſhall be regiſtered in the pariſh books as other poor; nor may churchwardens and overſeers bring to the pariſh account any money given to poor perſons, except on ſudden and emergent occaſions, who are not regiſtered, on pain of five pounds. The churchwardens and overſeers of pariſhes are impowered to purchaſe or hire houſes, and contract with perſons, to maintain the poor, &c. who refuſing to be ſo kept, ſhall be ſtruck out of the pariſh books, &c. 9. Geo. 1 cap. 7. See 3 Geo 2. c. 29.

POPE, Papa, the ſovereign pontif, or ſupreme head of the Romiſh church. The appellation of pope was anciently given to all Chriſtian biſhops, but about the latter end of the eleventh century, in the pontificate of Gregory VII. it was uſurped by the biſhop of Rome, whoſe peculiar title it has ever ſince continued. The ſpiritual monarchy of Rome ſprung up ſoon after the declenſion of the Roman empire.

POPLES, in anatomy, the inner part of the juncture, whereby the thigh-bone is articulated with the tibia.

POPLITÆUS, in anatomy, a ſmall muſcle obliquely pyramidal, ſituated under the ham. It is fixed above by a ſtrong narrow tendon, to the outer edge of the condyle of the inner os femoris, and to the neighbouring poſterior ligament of the joint; from thence it runs obliquely downwards, under the inner condyle of the os femoris; its flat and pretty thick fleſhy body increaſing gradually in breadth, till it is fixed in the backſide of the head of the tibia, all the way to the oblique line obſervable on that ſide.

POPLITEA, in anatomy, a name given to the third vein of the leg, ariſing from the heel, where it is formed out of ſeveral branches, coming both from the heel and ancle. It lies pretty deep in the fleſh, and aſcending up to the ham, terminates in the crural vein.

POPPY, *Papaver*, a medicinal plant with oblong leaves, and round ſtalks, divided into a few branches, each of which is terminated by a large tetrapetalous flower, ſet in a two-leaved cup, that falls off as the flower opens: the flower itſelf likewiſe ſoon falls, leaving a ſmooth roundiſh head or capſule, covered with a radiated crown, and containing a number of ſmooth roundiſh ſeeds. It is annual, and flowers from June to near the end of ſummer.

There are various kinds; ſome wild, ſome cultivated; the chief are the white, black, and red poppy: the former has ſmooth, ſlightly indented leaves, and whitiſh flowers and ſeeds: the black has alſo ſmooth, ſlightly indented leaves, purple flowers, and black ſeeds; and the latter has deep red flowers, dark-coloured ſeeds, hairy leaves and ſtalks, and the leaves cut almoſt, or quite, to the pedicle into indented ſegments. It is common in corn fields; and is ſometimes, like the others, made to vary its flowers by culture.

Theſe plants are found wild, as hath been already obſerved, in ſome parts of Europe; and ſeveral varieties of them, in regard to the flowers, are produced by culture in our gardens. The heads, ſtalks, and leaves, have an unpleaſant ſmell, and a bitteriſh biting taſte, of the ſame kind with thoſe of opium. Their ſmell and taſte is lodged in a milky juice, which abounds chiefly in the cortical part of the heads; which may be collected, in conſiderable quantity, by ſlightly wounding them when almoſt ripe; and which, on being expoſed for a little time to a warm air, thickens into a tenacious dark-coloured maſs, ſimilar to the opium brought from abroad, but ſtronger in ſmell and taſte. The juices, thus obtained from the black and white poppies, appear to be the ſame quality, the difference being only in the quantity afforded: the white, which is the largeſt, is the ſort cultivated by the preparers of opium in the eaſtern countries, and for medicinal uſes in this.

The collection of the pure milky juice of the poppy has not, among us, been as yet practiſed in large, or with a view to the ſupplying of the common demand of opium. Inſtead of this troubleſome proceſs, we extract the narcotic matter by menſtrua; the active parts of opium being completely diſſolvible both by water and rectified ſpirit. A portion of the herbaceous inert ſubſtance of the plant is indeed, at the ſame time, taken up, at leaſt when water is made uſe of, ſo as to render an enlargement of the doſe neceſſary; but this addition to the bulk of a doſe of opium would be of no inconvenience, if the compound was always of the ſame ſtrength, or the narcotic and inert matter in the ſame proportions to one another; a point which cannot be attained with ſo much preciſion as could be wiſhed, but which may nevertheleſs, by due care in the preparation, be adjuſted as nearly as common practice in moſt caſes requires.

The college of London directs the dried heads, cut and cleared from the ſeeds, to be boiled in water, in the proportion of three pounds and a half to ſix gallons, and now and then ſtirred to prevent their burning, till only about one third part of the liquor remains, which will be almoſt entirely ſoaked up by poppies: the decoction is to be ſtrongly preſſed out, boiled down to about four pints, then ſtrained whilſt hot, firſt through a ſieve, and afterwards through a fine woollen cloth, and ſet by for a night to ſettle: to the liquor poured off clear, ſix pounds of double refined ſugar are to be added; and the mixture boiled till its weight come to nine pounds or a little more, that it may become a ſyrup of a proper conſiſtence. An ounce of this ſyrup is reckoned equivalent to about a grain of opium, being found to have nearly the ſame ſoporific power with that quantity of the concrete juice, though it acts in general rather more kindly, and agrees in ſome caſes where opium itſelf cannot well be borne. See Opium.

POPLAR, *Populus*, in botany, a genus of trees producing male and female flowers on ſeparate plants, growing in an oblong amentum, looſely imbricated, and compoſed of

of ſcales which are oblong, plain, and cut at their margin; the corolla has no petals, but conſiſts of a monophyllous nectarium, turbinated at bottom, and tubulated at top; the ſtamina are eight very ſhort filaments, topped with large, tetragonal antheræ. The fruit is an ovate bilocular capſule, containing a number of oval ſeeds covered with a hairy down. There are different ſpecies of this genus, as the white poplar or abele tree, the black poplar, the aſpen tree, the Carolina poplar, &c. They are propagated either by layers, or large cuttings, planted in February, in a moiſt ſoil, where they will readily take root.

The beſt uſe theſe trees can be applied to, is for breaking off the weſterly, or northerly winds, and to be planted in ſuch land where ſcarce any other tree will thrive, for the advantage as will ariſe from its timber; for the wood of theſe trees, eſpecially of the abele, is very good to lay for floors, where it will laſt many years; and for its exceeding whiteneſs, is by many perſons preferred to oak; but being of a ſoft contexture, is very ſubject to take the impreſſion of any thing hard and pointed, which renders it leſs proper for this purpoſe: it is alſo very proper for wainſcotting rooms, being leſs ſubject to ſwell or ſhrink than moſt other ſorts of wood; but for turnery-ware there is no wood equal to this, for its exceeding whiteneſs; ſo that trays, bowls, and many other utenſils, are made of it: and the bellows-makers prefer it for their uſe; as do alſo the ſhoe-makers, for heels for womens ſhoes; and of this wood the ſhoes are made which are worn by the peaſants in France; it is alſo very good to make light carts; and the poles are very proper to ſupport vines, hops, &c. and the loppings will afford good fuel.

PORCELAIN, or PURCELAIN, a fine ſort of earthenware, chiefly manufactured in China, and thence called China-ware. See CHINA-WARE.

PORCELAIN-SHELL, *Porcellana*, in natural hiſtory, a genus of ſhell-fiſh, with a ſimple ſhell without any hinge, formed of one piece, and of a gibboſe figure on the back: the mouth is long, narrow, and dentated on each ſide; and the animal inhabitant is a limax.

PORCH, in architecture, a kind of veſtibule ſupported by columns; much uſed at the entrance of the ancient temples, halls, churches, &c.

A porch, in the ancient architecture, w asa veſtibule, or a diſpoſition of inſulated columns uſually crowned with a pediment, forming a covert-place before the principal door of a temple, or court of juſtice. Such is that before the door of St. Paul's Covent-Garden, the work of Inigo Jones.

PORCUPINE, *Hiſtrix*, in zoology, a very ſingular genus of quadrupeds, belonging to the order of the glires.

The fore-teeth of the porcupine are obliquely truncated, and it has no canine teeth: its ears are of a figure approaching to round, and the body is covered with prickles, or ſpins, and alſo with briſtles, like thoſe of a hog. The ſpines or quills, as they are commonly called, are of two kinds; ſome being ſhorter, thicker, ſtronger, and more ſharp-pointed; and others longer, weaker, and more flexible: theſe laſt are a foot long, and compreſſed at the point. The ſpines of the firſt kind are white at the baſe, and of a duſky cheſnut-colour on the upper part; and the latter kind are white at each extremity, and variegated with black and white in the middle. This terrible covering makes the creature appear much larger than it really is: it ſomewhat reſembles the badger in ſhape; and its length, from the noſe to the tail, is about two feet.

PORE, in anatomy, a little interſtice or ſpace between the parts of the ſkin, ſerving for perſpiration.

The pores are moſt eaſily perceived in the hands and feet. In viewing the hand with a moderate glaſs, after its being well waſhed, we perceive innumerable little ridges of equal ſize and diſtance running parallel to each other, eſpecially on the tips and joints of the fingers, where they are regularly diſpoſed into ſpherical triangles and ellipſes: on theſe ridges, the pores are placed in even rows, and by a good eye may be diſcerned without a glaſs; but with one, every pore looks like a little fountain, in which the ſweat may be ſeen to riſe like clear rock-water. They are placed in the ridges, and not in the furrows between them, that they might be leſs liable to be ſtopped by compreſſion; and on this account, the pores of the hands and feet are larger than the reſt.

PORPESSE, in ichthyology, a ſpecies of the delphinus, with a coniform body, a broad back, and a ſubacute roſtrum; it is a very large fiſh, frequently confounded with the dolphin, from which it is different.

PORPHYROGENITUS, in antiquity, an appellation given to the children of the eaſtern emperors, as being deſcended of parents who wore purple.

PORPHYRY, in natural hiſtory, a kind of ſtone of a plain uniform maſs, ſpotted with ſeparate concretions, of great hardneſs, giving fire with ſteel, not fermenting with acids, and very ſlowly and difficultly calcining in a ſtrong fire.

Porphyry is of ſeveral ſorts, as 1. The porphyry of the ancients, which is a moſt elegant maſs of an extremely firm and compact ſtructure, remarkably heavy and of a fine ſtrong purple, variegated more or leſs with pale, red and white; its purple is of all degrees, from the claret-colour to that of the violet, and its variegations are rarely diſpoſed in veins, but ſpots, ſometimes very ſmall, and at others, running into large blotches. It is leſs fine than many of the ordinary marbles, but it excels them all in hardneſs, and is capable of a moſt elegant poliſh. It is ſtill found in immenſe ſtrata in Egypt. 2. The hard red-lead-coloured porphyry, variegated with black, white and green. This is a moſt beautiful and valuable ſubſtance. It has the hardneſs, and all the other characters of the Oriental porphyry, and even greatly excels it in brightneſs, and in the beauty and variegation of its colours. It is found in great plenty in the iſland of Minorca, and is extremely worth importing, for it is greatly ſuperior to all the Italian marbles. 3. The hard, pale-red porphyry, variegated with black, white and green. This is of a pale fleſh-colour; often approaching to white. It is variegated in blotches from half an inch to an inch broad. It takes a high poliſh, and emulates all the qualities of the Oriental porphyry. It is found in immenſe ſtrata in Arabia Petræa, and in the upper Egypt; and in ſeparate nodules in Germany, England and Ireland.

PORRACEOUS, in medicine, a term applied to the bile, fœces, &c. when their colour approaches to that of a leek.

PORRUM, the leek, in botany, agrees with the cepa, or onion, both in botanical characters and medicinal virtues, being only accounted weaker. See the article ONION.

PORT, a harbour, river, or haven, either formed by nature or art, to receive and ſhelter ſhipping from the ſtorms and waves of the open ſea.

Artificial ports are thoſe which are either formed by throwing a ſtrong mound or rampire acroſs the harbour's mouth to ſome iſland or rock, or erecting two long barriers, which ſtretch from the land on each ſide like arms or the horns of a creſcent, and nearly incloſe the haven; the former of theſe are called mole-heads, and the latter piers. See the articles MOLE-HEAD, PIER, and HARBOUR.

PORT alſo implies the left-ſide of the ſhip, as port the helm, i. e. put the helm to the larboard or left-ſide.

PORTS *of a Ship*, the embraſures or holes thro' which the cannon are fixed.

Bar-PORT, a port whoſe entrance is ſtopped up with a bar, or bank of ſand, and can only be entered at high water, as that of Dublin.

Cinque PORTS. See CINQUE-*Ports*.

Cloſe-PORT, a port within the body of a city, as thoſe of Venice, Rhodes, and Amſterdam.

Free-PORT, in commerce, a port in which merchants of all nations may load and unload their veſſels, without paying any duties or cuſtoms: as thoſe of Leghorn, Genoa, &c.

PORT is alſo a ſtrong wine brought from Port-a-port, alſo called Porto and Oporto. See PORTO.

PORT *of the Voice*, in muſic, the faculty or habit of making the ſhakes, paſſages, and diminutions, in which the beauty of a ſong or piece of muſic conſiſts.

PORT-CRAYON, a pencil-caſe, which is uſually four

or five inches long, and contrived ſo as that the pencil may ſlide up and down. Its inſide is round, and its outſide is ſometimes filed into eight ſides or faces, on which are drawn the ſector-lines; ſometimes it is made round both without-ſide and within, and has its length divided into inches and parts of inches.

PORT-CULLICE, or HERSE. See HERSE.

PORT-GREVE, or PORT-GRAVE, was formerly the principal magiſtrate of maritime towns. The chief magiſtrate of London was anciently called by this name, till Richard I. cauſed the city to be governed by two bailiffs, ſoon after which king John granted the city a mayor.

PORT-VENT, in an organ, is a wooden pipe which ſerves to convey the wind from the bellows to the ſound-board. See ORGAN.

PORTA, or VENA-PORTA, in anatomy, one of the three primary veins of the human body.

The vena-porta in its ſtructure has ſome reſemblance of a tree; the roots or inferior branches of which are divided into the right and left. From the right ariſe all the meſeraic veins of the inteſtines, the internal hæmorrhoidal, and the right epiploics: and from the left, which is called the ſplenic vein, ariſe the gaſtric veins, which are various, and form the coronary vein of the ſtomach; the vaſa brevia, the epiploic, and the gaſtro-epiploic veins; the pancreatic, and ſometimes alſo the internal hæmorrhoidal vein. The trunk of the vena-porta, which goes to the liver, affords the cyſtic veins, the right gaſtric, the duodenal, and this laſt often the pancreatic. In the branches, where the trunk begins to explicate, it conſtitutes the ſinus-portæ in the liver; and from this it is divided into innumerable branches, which are diſperſed through the whole ſubſtance of the liver.

PORTAIL, in architecture, the frontiſpiece of a church viewed on the ſide on which is the great door.

Portail is alſo uſed for the great door of a palace, caſtle, &c.

PORTAL, in architecture, a little gate where there are two gates of a different bigneſs; alſo a little ſquare corner of a room cut off from the reſt by the wainſcot, and forming a ſhort paſſage into the room. The ſame name is alſo ſometimes given to a kind of arch of joiners work before a door.

PORTATE, or a CROSS-PORTATE, in heraldry, a croſs which does not ſtand upright, as croſſes generally do, but lies acroſs the eſcutcheon in bend, as if it were carried on a man's ſhoulder.

PORTICO, in architecture, a kind of gallery on the ground, ſupported by columns, where people walk under covert. Though this word is derived from *porta*, a gate or door, yet it is uſed for any diſpoſition of columns which form a gallery.

PORTION, in law, a part, or proportion, either of money given with a daughter, or of an inheritance.

PORTION, in the canon-law, is that proportion or allowance which a vicar receives out of a rectory or impropriation.

PORTIONER, is where a perſonage is ſerved by two or more clergymen alternately, in which caſe the miniſters are called portioners, becauſe they have only their proportion of the tithes or profits of the living.

PORTMANTEAU, a cloak-bag of cloth, leather, &c. in which the cloak, linen, and other habiliments of travellers are diſpoſed and laid on the horſe's crupper.

PORTRAIT, POURTRAIT, or *Pourtraiture*, in painting, the repreſentation of a perſon, and eſpecially of a face done from the life.

In this ſenſe we uſe the term portrait-painting, in contradiſtinction to hiſtory painting, where a reſemblance of perſon is uſually diſregarded. Portraits, when as large as the life, are uſually painted in oil-colours; ſometimes they are painted in miniature with water-colours, crayons, paſtils, &c.

PORTUGAL, the moſt weſterly kingdom in Europe; it is about three hundred miles long, and one hundred broad, and is ſituated between the ſeventh and tenth deg. of weſt longitude, and between the thirty-ſeventh and forty-ſecond of north latitude; being bounded by Spain on the north and eaſt, and by the Atlantic ocean on the ſouth and weſt. This country is neither ſo hot nor ſo fruitful as Spain; it however produces plenty of grapes, olives, oranges, and lemons.

PORUS BILARIUS, according to ſome, is the ſame with the hepatic duct; but others make a diſtinction between them, and obſerve, that the ductus hepaticus runs from the liver to the ductus choledochus; and that the branches of this diſtributed through the whole liver, make what are called the pori bilarii.

POSE', in heraldry, denotes a lion, horſe, or other beaſt ſtanding ſtill with all his four feet on the ground.

POSITION, or SITUATION, in phyſics, an affection of place, which expreſſes the manner of any body's being therein.

POSITION, in architecture, denotes the ſituation of a building with regard to the points of the horizon. Vitruvius directs the poſition of a building to be ſuch, as that the four corners point directly to the four cardinal winds.

POSITION, *Falſe Poſition*, or *Rule of Falſhood*, in arithmetic, conſiſts in calculating on ſeveral falſe numbers, taken at random, and, from the differences found therein, determining the number ſought.

POSITION is either ſingle or double.

Single POSITION is when there happens in the propoſition ſome partition of numbers into parts proportional, and then, by one operation, the queſtion may be reſolved by this rule:

Imagine a number at pleaſure, and work therewith, according to the tenor of the queſtion, as if it were the true number, and what proportion there is between the falſe concluſion and the falſe poſition, ſuch proportion hath the given number to the number ſought; therefore the number, found by augmentation, ſhall be the firſt term of the rule of three, and the number ſuppoſed ſhall be the ſecond term, and the given number ſhall be the third term.

Double POSITION, is when there can be no partition in the numbers to make a proportion: therefore, you muſt make a ſuppoſition twice, proceeding therein, according to the tenor of the queſtion; and if either of the ſuppoſed numbers happens to ſolve the propoſition, the work is done; but, if not, obſerve the errors, and whether they be greater or leſs than the reſolution requireth; and mark the errors accordingly, with the ſigns + or −.

Then multiply contrariwiſe the one poſition by the other error, and if the errors be both too great, or both too little, ſubtract the one product from the other, and divide the difference of the products by the difference of the errors.

But if the errors be unlike, as the one + and the other −, add the products, and divide the ſum thereof by the ſum of the errors added together: for the proportion of the errors is the ſame with the proportion of the exceſſes or defects of the numbers ſuppoſed to the numbers ſought.

POSITION, in geometry.—A line is ſaid to be given in poſition, when its ſituation, bearing, or direction, with regard to ſome other line, is given.

POSITION is alſo uſed for a theſis or propoſition maintained in the ſchools.

POSITIVE, a term of relation ſometimes oppoſed to negative: hence a poſitive quantity, in algebra, is a real or affirmative quantity, or a quantity greater than nothing: thus called in oppoſition to a privative or negative quantity, which is leſs than nothing, and marked by the ſign −. Poſitive quantities are deſigned by the character + prefixed or ſuppoſed to be prefixed to them.

POSITIVE DEGREE, in grammar, is the adjective in its ſimple ſignification, without any compariſon; or it is that termination of the adjective which expreſſes itſelf ſimply, and abſolutely, without comparing it with any other.

POSITIVE, in muſic, denotes a little organ uſually placed behind or at the feet of an organiſt, played with the ſame wind, and the ſame bellows, and conſiſting of the ſame number of pipes with the larger one, though thoſe much ſmaller, and in a certain proportion: this is properly the choir-organ.

POSSE COMITATUS, in law, ſignifies the power of the county, or the aid and aſſiſtance of all the knights, gentlemen, yeomen, labourers, ſervants, apprentices, &c. and all others within the county that are above the age of fifteen,

fifteen, except women, eccleſiaſtical perſons, and ſuch as are decrepid and infirm.

POSSESSION, in law, the holding or occupying of any thing, either de jure or de facto.

Poſſeſſion de jure is the title a man has to enjoy a thing, though it be uſurped, and in the actual poſſeſſion of another; or where lands are deſcended to a perſon, and he has not yet entered into them: and poſſeſſion de facto, or actual poſſeſſion, is where there is an actual and effectual enjoyment of a thing.

POSSESSIVE, in grammar, a term applied to pronouns which denote the enjoyment or poſſeſſion of any thing, either in particular or in common; as *meus*, mine, and *tuus*, thine; *noſter*, ours, and *veſter*, yours. See PRONOUN.

POSSIBILITY, *Poſſibilitas*, in law, is defined to be any thing that is altogether uncertain, or what may or may not be, and is taken to be either near or remote. A near poſſibility is where an eſtate is limited to one after another's decreaſe, whilſt a remote poſſibility is ſomething extraordinary that is never likely to come to paſs.

POSSIBLE, *Poſſibile*, is ſometimes oppoſed to real exiſtence, and underſtood of a thing which, though it does not actually exiſt, yet may exiſt; as a new ſtar, another world, &c. which are particularly ſaid to be phyſically poſſible. It is alſo oppoſed to impoſſible, in which ſenſe it is applicable to any thing that does not contradict itſelf, or involve contradictory predicates, whether it actually exiſt or not, as a man, fire, &c. theſe are alſo ſaid to be logically poſſible.

POST, a courier or letter-carrier, or one who frequently changes horſes, poſted or placed on the road, for quicker diſpatch. The word is alſo applied to the houſes where ſuch a perſon takes up and lays down his charge.

Penny-POST, a poſt eſtabliſhed for the benefit of London and the adjacent parts; by which any letter or parcel not exceeding ſixteen ounces weight, or ten pounds value, is ſpeedily conveyed to and from all parts within ten miles of London.

POST, in the military art, is any place or ſpot of ground fortified or not, where a body of men may make a ſtand and fortify themſelves, or remain in a condition to fight an enemy. Hence it is ſaid, that the poſt was relieved, the poſt was taken ſword in hand, &c.

Advanced POST is a ſpot of ground ſeized by a party to ſecure the army, and cover the poſts that are behind.

POSTS, in building, large pieces of timber placed upright in houſes. The poſts framed into breſſummers for ſtrengthening the carcaſe of a houſe, are called prick-poſts, and the corner-poſts are called the principal poſts.

Burning a little the ends of the poſts that are to be ſet into the ground, is ſaid to be an excellent method to prevent them from rotting.

POSTS, in ſculpture, are ornaments formed after the manner of rolls or wreathings, ſome of which are ſimple, and others enriched, or flouriſhed.

POSTERIOR, a term of relation implying ſomething behind, or that comes after another, in which ſenſe it is uſed in oppoſition to prior and anterior.

POSTERN, in fortification, is a ſmall gate generally made in the angle of the flank of a baſtion, or in that of the curtin, or near the orillon, deſcending into the ditch; by which the garriſon may march in and out unperceived by the enemy, either to relieve the works, or to make private ſallies, &c.

POSTHUMOUS, a child born after the death of his father, or taken out of the body of a dead mother, from whence it is frequently applied to the works of an author not publiſhed till after his deceaſe.

POSTIL, a name anciently given to a note in the margin of the Bible, and afterwards to one in any other book poſterior to the text.

POSTING, among merchants, the putting an account forward from one book to another, particularly from the journal or waſte-book to the ledger.

POSTIQUE, in architecture, an ornament of ſculpture ſuper-added after the work is done. A table of marble, or other matter, is alſo ſaid to be poſtique, when it is incruſtated in a decoration of architecture, &c.

POSTPONING, putting any thing after or behind another, with regard to time.

POSTSCRIPT, an article added to a letter or memoir, containing ſomething learnt or recollected after the piece was written.

POSTULATE, *Poſtulatum*, in mathematics, &c. is deſcribed to be ſuch an eaſy, and ſelf-evident ſuppoſition, as needs no explication or illuſtration to render it intelligible; as, that a right line may be drawn from one point to another; that a circle may be deſcribed on any center given, of any magnitude, &c. However, authors are not well agreed as to the ſignification of the term poſtulatum; ſome make the difference between axioms and poſtulata to be the ſame as that between theorems and problems; axioms, according to thoſe authors, being indemonſtrable theoretical truths. But others will have it, that axioms are primitive and common to all things, partaking of the nature of quantity, and which therefore may become the objects of mathematical ſcience: ſuch as number, time, extenſion, weight, motion, &c. and that poſtulata relate particularly to magnitudes, ſtrictly ſo called, as to things having local extenſion, ſuch as lines, ſurfaces, and ſolids; ſo that in this ſenſe of the word poſtulatum, Euclid, beſides axioms, or thoſe principles which are common to all kinds of quantities, has aſſumed certain poſtulata to be granted him peculiar to extenſive magnitude. Hence ſeveral of the principles aſſumed in his Elements, and ranked among the axioms by the moderns, are by Proclus ranked among the poſtulata, which has induced Dr. Wallis to judge that the laſt of the two ſenſes given to the term poſtulatum is moſt agreeable to the meaning of the ancient geometers.

POSTURE, in painting and ſculpture, the ſituation of a figure with regard to the eye, and of the ſeveral principal members thereof with regard to one another, whereby its action is expreſſed.

POTABLE, *Potabilis*, ſomething that may be ſwallowed by way of drink.

POT-ASH, the lixivious aſhes of certain vegetables, uſed in the making of glaſs, ſoap, &c. See GLASS, SOAP, &c.

There are two principal ſorts of theſe ſalts brought chiefly from Germany pearl aſh, and pot-aſh. The pearl aſh is either of the whitiſh pearl colour from which it receives its name, or externally of a bluiſh caſt, which theſe kinds of ſalts are apt to receive in calcination from the contact of any inflammable matter. Both the pearl-aſhes are tolerably pure alkalies: diſſolved in water, or deliquiated in the air, they leave only a ſmall quantity of earthy matter, ſcarcely more than every alkaline ſalt does upon repeated ſolutions and calcinations. They are ſometimes, however, adulterated with heterogeneous ſaline matters, particularly ſea-ſalt. The purity of pearl-aſh from ſubſtances of the earthy kind points out the method in which it has been prepared, namely, evaporating a ley of vegetable aſhes till the ſalt remains dry.

Pot-aſh is a much more impure ſaline maſs: that called Ruſſia or Moſcovy pot-aſh is accounted the beſt. This is of a dark-colour, conſiderably hard, and does not eaſily grow moiſt in the air: on boiling it in water, a quantity of earth remains undiſſolved, much larger than that of the ſalt which is extracted. It is nevertheleſs found to be ſtrongly alkaline, to be more pungent to the taſte, to ſaturate more acid, and more powerfully to diſſolve oils, than the purer alkaline ſalts: hence it is preferred by the ſope-boiler.

This ſalt is ſaid to be prepared, by burning wood with a cloſe ſmothering heat; making a ley from the coarſer part of the aſhes, and moiſtening therewith the finer part into the conſiſtence of a paſte, ſtratifying this paſte with ſome of the inflammable kinds of wood, and ſetting the pile on fire. It is not improbable that the ſaline and earthy part of the aſhes would thus run together into hard lumps; but a maſs poſſeſſing the activity of Ruſſia pot-aſh is not to be obtained by any proceſs of this kind. For the diſcovery of the ingredient on which that quality depends, we are obliged to Dr. Home, who, in his Eſſay

on

on bleaching, has proved, by a number of curious experiments, that Ruſſia pot-aſh contains a large admixture of quick-lime.

POTATOE, in botany, the Engliſh name for a ſpecies of the tuberoſe rooted ſolanum.

Culture of POTATOES.—The moſt advantageous way of propagating potatoes is, the planting them at large diſtances, and digging or horſe-hoeing the ground ſeveral times between them.

Mr. Tull gives an example of this, in which the hoeing ſucceeded much better than dung, and without the expence of it. A piece of ground was planted with potatoes, the greater part of it in the common way; but in one part, worſe than the reſt, they had been ſet at a yard diſtance every way. The reſt of the ground was dunged; this poor part had no dung, but was ploughed deep at ſeveral times four different ways, ſo that the ground was ſtirred and broken thoroughly every-where about the potatoes. The conſequence was, that though no dung was uſed here, and though the plants appeared much weaker than in the dung part, yet the crop was greatly better than that of the other part of the field. The roots here were all large, and in the other parts of the field, where the dung had been uſed without ploughing, they were ſo ſmall, that the crop was ſcarce worth taking up.

This is one of many inſtances of the no great uſe in dunging land, without properly ſtirring it up, and ſerves to prove, what the crops of corn and every thing elſe confirm upon trial, that the ſtirring the earth ſufficiently, without any farther trouble, will anſwer better without any other manure, than all the manure in the world without it. *Tull's Horſe-hoeing Huſbandry.*

POTENT, or POTENCE, in heraldry, a term for a kind of a croſs, whoſe ends all terminate like the head of a crutch.

POTENTIA, POWER, that whereby a thing is capable either of acting, or being acted upon. See the article POWER.

POTENTIAL, in the ſchools, is uſed to denote and diſtinguiſh a kind of qualities, which are ſuppoſed to exiſt in the body in potentia only, by which they are capable in ſome manner of affecting and impreſſing on us the ideas of ſuch qualities, though not actually inherent in themſelves; in which ſenſe we ſay, potential heat, potential cold.

POTENTIAL, in medicine. Cauteries are diſtinguiſhed into actual and potential. See the article CAUTERY.

POTENTIAL, in grammar, an epithet applied to one of the moods of verbs. The potential is the ſame in form with the ſubjunctive, and is according to Ruddiman implied in that mood, for which reaſon that grammarian rejects it; but others will have it differ from the ſubjunctive in this, that it always implies in it either *poſſum*, *volo*, or *debeo*. It is ſometimes called the permiſſive mood, becauſe it often implies a permiſſion or conceſſion to do a thing.

POTERIUM, burnet, in botany. See BURNET.

POTION, POTIO, a liquid medicine, conſiſting of as much as can be drank at one draught. The writers on pharmacy diſtinguiſh potions into cathartic, cardiac, and alterative.

POTTERY, the manufacture of earthen-ware, or the art of making earthen veſſels.

The wheel and lathe are the chief, and almoſt the only inſtruments uſed in pottery: the firſt for large works, and the laſt for ſmall. The potters wheel conſiſts principally in the nut, which is a beam or axis, whoſe foot or pivot plays perpendicularly on a free-ſtone, ſole or bottom. From the four corners of this beam, which does not exceed two feet in height, ariſe four iron-bars, called the ſpokes of the wheel; which, forming diagonal lines with the beam, deſcend, and are faſtened at bottom to the edges of a ſtrong wooden circle, four feet in diameter, perfect like the felloes of a coach-wheel, except that it has neither axis nor radii, and is only joined to the beam, which ſerves it as an axis by the iron-bars. The top of the nut is flat, of a circular figure, and a foot in diameter; and on this is laid the clay which is to be turned and faſhioned. The wheel, thus diſpoſed, is encompaſſed with four ſides of four different pieces of wood faſtened on a wooden frame; the hind-piece, which is that on which the workman ſits, is made a little inclining towards the wheel; on the fore-pieces are placed the prepared earth; on the ſide-pieces he reſts his feet, and theſe are made inclining to give him more or leſs room. Having prepared the earth, the potter lays a round piece of it on the circular head of the nut, and fitting down turns the wheel with his feet till it has got the proper velocity; then, wetting his hands with water, he preſſes his fiſt or his fingers-ends into the middle of the lump, and thus forms the cavity of the veſſel, continuing to widen it from the middle; and thus turning the inſide into form with one hand, while he proportions the outſide with the other, the wheel conſtantly turning all the while, and he wetting his hands from time to time. When the veſſel is too thick, he uſes a flat piece of iron, ſomewhat ſharp on the edge, to pare off what is redundant; and when it is finiſhed, it is taken off from the circular head, by a wire paſſed underneath the veſſel.

The potters-lathe is alſo a kind of wheel, but more ſimple and ſlight than the former; its three chief members are an iron-beam or axis three feet and a half high, and two feet and a half diameter, placed horizontally at the top of the beam, and ſerving to form the veſſel upon: and another larger wooden wheel, all of a piece, three inches thick, and two or three feet broad, faſtened to the ſame beam at the bottom, and parallel to the horizon. The beam or axis turns by a pivot at the bottom in an iron-ſtand. The workman gives the motion to the lathe with his feet, by puſhing the great wheel alternately with each foot, ſtill giving it a greater or leſſer degree of motion, as his work requires. They work with the lathe, with the ſame inſtruments, and after the ſame manner as with the wheel. The mouldings are formed by holding a piece of wood or iron cut in the form of the moulding to the veſſel, while the wheel is turning round; but the feet and handles are made by themſelves and ſet on with the hand; and if there be any ſculpture in the work, it is uſually done in wooden moulds, and ſtuck on piece by piece on the outſide of the veſſel. For the glazing of the work, ſee GLAZING.

POTTLE, an Engliſh meaſure containing two quarts. See MEASURE.

POULTICE, or POULTIS, a form of medicine alſo called cataplaſm. See CATAPLASM.

POULTRY, all kinds of domeſtic birds brought up in yards, as cocks, hens, capons, ducks, turkeys, &c.

POUNCE, gum ſandaric pounded and ſifted very fine, to rub on paper, in order to preſerve it from ſinking, and to make it fit to write upon.

POUNCE is alſo a little heap of charcoal duſt, incloſed in a piece of muſlin or ſome other open ſtuff, to be paſſed over holes pricked in a work, in order to mark the lines or deſigns thereof on paper, ſilk, &c. placed underneath; which are to be afterwards finiſhed with a pen and ink, a needle, or the like. This kind of pounce is much uſed by embroiderers, to transfer their patterns upon ſtuffs; by lace-makers, and ſometimes alſo by engravers.

POUND, *Libra*, a ſtandard-weight, for the proportion and ſubdiviſions of which, ſee the article WEIGHT.

POUND alſo denotes a money of account; ſo called, becauſe the ancient pound of ſilver weighed a pound troy.

POUND, among lawyers, denotes a place of ſtrength, in which to keep cattle that are diſtrained, or put in for treſpaſs, until they are replevied or redeemed.

POUNDAGE, a ſubſidy of twelve pence in the pound, granted to the crown on all goods and merchandizes exported or imported; and if by aliens, one penny more.

POURSUIVANT, PURSUIVANT, in heraldry, the loweſt order of officers at arms.

POURTRAIT, or PORTRAIT. See the article PORTRAIT.

POURVEYANCE, or PURVEYANCE, in law, the providing corn, fuel, victuals, &c. for the king's houſehold; and hence, the officer, who did ſo, was termed pourveyor.

POWDER, *Pulvis*, in pharmacy, a dry medicine well broken, either in a mortar, by grinding, or by chemical operations.

POW-

POWDERINGS, among builders, certain devices, ſerving to fill up vacant places in carved works.

POWER, *Potentia*, in phyſiology, the faculty of doing or ſuffering any thing.

Power therefore is two-fold, viz. conſidered as able to make, or able to receive any change; the former of which may be called active power, and the latter paſſive power. Of paſſive power, all ſenſible things abundantly furniſh us with ideas, whoſe ſenſible qualities and beings we find to be in a continual flux, and therefore we look on them as liable to the ſame changes. Nor have we fewer inſtances of active power; ſince whatever change is obſerved, the mind muſt collect a power ſomewhere able to effect it; but, eſpecially, by reflecting on the operations of our own minds, as the power of perception, of volition, &c. See the articles FREEDOM, WILL, PERCEPTION, &c.

Dr. Keil demonſtrates that the phyſical power, or action of bodies, propagated in orbem; as light, heat, odour, &c. has its efficacy increaſed or diminiſhed in a duplicate ratio of the diſtances from the center of radiation, or exertion of that power.

POWER, in mechanics, denotes any force whether of a man, horſe, a ſpring, the wind, water, &c. which being applied to a machine, tends to produce motion. See MACHINE and ENGINE.

The intenſity of a power is its abſolute force; that is, its force, ſuppoſing its velocity equal to its weight: for its moving or acting force may be greater or leſs, according as its velocity is increaſed or diminiſhed, in reſpect of that of the weight. As for example, if a man be the power, and can raiſe from the ground a certain weight, that weight will expreſs or be equal to the intenſity of the power; for in this caſe, whatever engine be made uſe of, that part of the engine, where the weight is duly applied, will move juſt as faſt as that on which a man acts with his whole force.

A power may act in any direction whatever; but a weight has only one direction, viz. towards the center of the earth. See GRAVITATION.

When we ſpeak of the mechanical powers, the word power is taken in a very different ſenſe from that above laid down; ſince, in this caſe, it ſignifies only an organ or inſtrument, whereby a power of a known intenſity is made to act upon a weight: and therefore we muſt take care not to attribute any real force to any ſimple or compound machine, as many are apt to do merely becauſe the name power has been given to mechanical organs, not from their effect, but from the effect which the power produces by their means. For how much ſoever the force of a power is thereby increaſed, in order to ſuſtain or raiſe a weight far ſuperior to it in intenſity; yet this cannot be done without loſing in ſpace and time what is gained in force; contrary to what ſome have vainly imagined, becauſe the vulgar commonly ſpeak of a machine as they do of an animal; attributing that effect to the machine, which is only the effect of the power by means of the machine: thus, it is uſual to ſay, ſuch a machine raiſes ſuch a quantity of water, or performs ſuch and ſuch work; when we ſhould ſay, if we would ſpeak philoſophically, ſuch a running ſtream; ſuch a fall of water, the wind, or ſo many men, horſes, oxen, &c. raiſe ſo much water in ſuch a time, &c. by means of ſuch or ſuch a machine. It were therefore to be wiſhed, that the word power were to be confined to its proper ſenſe, and not uſed to ſignify one of the mechanical organs; however, as it has been cuſtomary to uſe it in that ſenſe, we have done ſo too, but withal thought proper to give the above caution.

The ſimple mechanical organs or powers are the lever, ballance, axis in peritrochio, pully, ſcrew, wedge, and inclined plane. See the articles LEVER, BALLANCE, &c.

POWER, in law, ſignifies in general, a particular authority, granted by any perſon to another to repreſent him, or act in his ſtead.

POWERS, in arithmetic and algebra, are numbers or quantities ariſing from the ſquaring or multiplication of any number or quantity by itſelf, and then that product by the root or firſt number again; and this third product by the root again; and ſo on ad infinitum; as 2, 4, 8, 16, 32, 64, 128, 256, &c. Where 2 is called the root or firſt power, 4 is its ſquare or ſecond power, 8 its cube or third power, 16 its biquadrate or fourth power, &c. And theſe powers in letters or ſpecies are expreſſed by repeating the root as often as the index of the power expreſſes. Thus a is the root or firſt power, $a\,a$, the ſquare or ſecond power, $a\,a\,a$ the cube, $a\,a\,a\,a$ the biquadrate or fourth power. And to avoid the tedioufneſs of repeating the root ſo often, when the powers are high, we only put down the root with the index of the power over it, thus; a^9 is the ninth power of a; b^{16}, b^{94}, are the 16th and 94th powers of b. See the article INVOLUTION.

POWER *of an Hyperbola*, is the ſixteenth part of the ſquare of the conjugate axis, or the one fourth part of the ſquare of the ſemi-conjugate axis; or it is equal to a rectangle under the one fourth of the tranſverſe axis, and one fourth part of the ſum of the tranſverſe axis, and parameter.

POX, or SMALL-POX, *Variolæ*, in medicine, a contagious diſeaſe appearing on the ſurface of the ſkin, which it covers with puſtules, or ulcerous eruptions, that frequently leave ſcars behind them.

The ſmall-pox is commonly divided into two kinds, the diſtinct and the confluent. The diſtinct or regular ſort, according to Sydenham, begins with a ſhuddering chilneſs, which is ſucceeded by an intenſe heat, violent pain of the head and back, vomiting, drowſineſs, and ſometimes epileptic fits, eſpecially in children, which ſhew the pox to be ready to burſt forth, and that they will be mild. The eruptions are uſually on the fourth day from the beginning, at which time the feveriſh ſymptoms either abate or wholly diſappear. The ſpots are at firſt reddiſh, and ſpread themſelves over the neck, breaſt, and the whole body. On the eighth day the ſpaces between the puſtules which were hitherto white, begin to grow red, and ſwell, the eye-lids are puffed up, and cloſe the eyes; next to the face, the hands begin to ſwell; and the puſtules of the face, before ſmooth and red, begin to be rough and whitiſh, and throw out a yellowiſh matter. On the eleventh day, the ſwelling of the face and inflammation diſappear; and the puſtules being ripe, grow dry and fall off: and on the fourteenth or fifteenth day, periſh entirely. In the confluent ſorts there are the ſame ſymptoms, but more violent; and as the diſeaſe increaſes, the eruptions do not ariſe to any conſiderable height: this ſort is attended with ſpitting in adults, and generally with a looſeneſs in children.

But though moſt authors, as we have already obſerved, divide the ſmall pox into the diſtinct and confluent ſorts, Dr. Mead thinks it more accurate, and agreeable to the nature of the diſeaſe, to divide it into ſimple and malignant. The ſimple ſort is that in which the eruption is attended with a ſlight fever of ſhort duration, the puſtules fill kindly, make good matter in a few days, and at laſt fall off in dry ſcabs. The malignant ſort is that in which the eruption is attended with a malignant fever, the puſtules hardly come to any tolerable degree of maturity, and either ſuppurate not at all, or if they do in ſome meaſure, they are with difficulty brought to end in little cruſts. The malignity appearing in various forms, has given various appellations to this diſeaſe, as the cryſtalline, the warty, and the bloody. The puſtules of the cryſtalline ſort, inſtead of a thick well-digeſted matter, contain nothing but a thin pale water, and are in ſome meaſure pellucid. And this ſort is ſometimes obſerved in the diſtinct as well as the confluent: ſometimes this fluid flies off, and leaves hollow bladders. The warty puſtules contain no fluid, but grow hard and prominent above the ſkin like warts; theſe are peculiar to the diſtinct ſort. The bloody puſtules are produced more ways than one; for ſometimes, at the very beginning of the diſeaſe, the puſtules are ſmall tubercles full of blackiſh blood, as if the ſkin was pinched with a forceps; then purple and livid ſpots follow, as in the true plague: but it more frequently happens, that the puſtules coming out very thick; on the third or fourth day after, when they ought to fill, become livid and a little bloody, with black ſpots ſpread over the whole body, which forebode death in a day or two, theſe being real gangrenes. It very often falls out at this time, that a thin blood flows not only out of the patient's mouth, noſe, and eyes, but alſo by every outlet

of the body, but more eſpecially by the urinary paſſages, as it does ſometimes on the firſt days of the diſtemper: theſe are manifeſtly of the confluent kind.

In the management of the patient, in the diſtinct ſort, it is a general rule, ſays Dr. Mead, to keep the patient in bed during the firſt days of the diſtemper, but neither to ſtifle him by heat and cloaths, nor to check the perſpiration by cold; yet care ought to be taken to ſupply him with pure and cool air. With regard to diet, it ought to be very ſlender, moiſtening, and cooling, ſuch as oatmeal or barley-gruel; and in the beginning, the beſt regimen is that which keeps the body open, and promotes urine: this end is obtained by boiling preſerved fruit with their food, and giving them ſubacid liquors for drink, as ſmall beer acidulated with orange or lemon-juice, whey turned with apples boiled in milk, &c.

In the cure, Sydenham adviſes bleeding on any of the three firſt days, and then an ounce or an ounce and an half of emetic wine. Mead alſo, in the firſt place, adviſes bleeding even to children, and affirms that when they are ſeized with convulſions at the onſet of the diſeaſe, ſome evacuation ought to be made, which may be ſafely done by leeches applied to the temples, or behind the ears, and that in moſt young ſubjects, if blood cannot be drawn from the arm, either of the jugulars may be opened. In youths and adults, he ſays, it is often neceſſary to take away blood two or three times, only with an intermiſſion of two or three days between each time; for blood-letting is ſo far from being an obſtacle to the eruption of the puſtules, if the patient is not too weak, that it forwards it conſiderably. He adds, that after bleeding, a vomit ſhould be given, if the ſtomach abound with phlegm or bile, or be loaded with food unſeaſonably taken: otherwiſe a purge may be preſcribed before the eruption of the puſtules, which may be the infuſion of ſena with manna, or manna alone, eſpecially for children. To keep the inflammation of the blood within due bounds, and to aſſiſt the expulſion of the morbific matter through the ſkin, take half an ounce of bezoardic powder, and two drams of purified nitre; mix theſe powders: half a dram of this mixture may be taken by an adult three or four times in a day; diminiſhing the quantity for children according to their age. Sometimes equal quantities of theſe ingredients may be preſcribed; and if the effervеſcence of the fever runs very high, a proper quantity of the ſpirit of vitriol may be added to the patient's drink. When the eruption of the puſtules is completed, an adult patient may take about fourteen drops of liquid laudanum, or an ounce of ſyrup of white poppies, in a little cowſlip-flower-water, every night. But opiates are improper for children.

If this method is proper in the diſtinct ſmall-pox, it will be found more neceſſary in the confluent. In the cryſtalline ſort, the water of the puſtules can never be brought to a laudable ſuppuration; therefore, while the thinner parts are made to tranſpire through the ſkin, the groſſer ought to be drawn off through the urinary paſſages. To this purpoſe nitre may be adminiſtered three or four times a day, from a ſcruple to half a dram, in ſmall wine; and while nitre is thus taken, it will be proper to interpoſe medicines which cheriſh the heart, and promote the flux of the humours into the puſtules, as the cordial confection, or the bezoardic powder, ſometimes with a little ſaffron. Beſides, on the fifth or ſixth day, bliſters are to be applied between the ſhoulders, and to the arms and legs; for which purpoſe the bliſtering epithem is moſt convenient. In the warty ſmall-pox, which is more dangerous than the cryſtalline, the utmoſt endeavours are to be uſed to take off the fever, and to provoke a ſweat, in order to digeſt the morbid humour, by the cordial medicines above-mentioned; and, in this caſe, bliſters are likewiſe to be applied. The bloody ſmall-pox requires peculiar attention; and Mead obſerves, that if there be any room for phyſic, thoſe medicines bid faireſt for ſucceſs, which tend to thicken the blood: the beſt of this kind are the Peruvian bark, alum, and oil of vitriol; which are beſt uſed alternately in this manner, a dram of the bark may be given every ſixth hour, and three hours after a proper quantity of alum; which will be a powerful medicine, if thus compounded, melt three parts of alum with one part of dragon's blood, over the fire; and when the maſs is grown cold, reduce it to a powder: a ſcruple of this, made into a bolus with oil of roſes, will be a proper doſe. The moſt convenient manner of giving the oil of vitriol is in the tincture of roſes; of which tincture five or ſix ſpoonfuls may be taken four or five times a day. In every ſort of this diſeaſe, it is proper to open the body on the decline, that is, on the ninth or tenth day from the eruption; becauſe a putrid fever generally comes on about that time, while the puſtules are drying; or upon the ſubſiding of the ſwelling of the inflamed ſkin, where there is no ſuppuration; gentle cathartics are the ſafeſt means of removing this fever, and ſuch as were directed before the eruption; but if any purulent matter ſhould ſtill lurk under the withered ſkin of the puſtules, the body is not yet to be purged, but rather to be ſupported by proper diet, till the matter is all come away.

French Pox, *Lues Venerea*, is defined a malignant and putredinous dyſcraſy of all the humours, but eſpecially of the ſerum and lymph, ariſing from a venereal taint received into the body; or, according to Sydenham, when a gonorrhœa has continued a long while, or long enough for the poiſonous matter to make its way into the blood; or by aſtringents given unſeaſonably, it cannot make its exit, then the patient is infected with the French pox. See Gonorrhoea.

The buboes in the groin conſtitute the firſt degree of this diſtemper: then follow pains of the head, joints, of the ſhoulders, arms, and ancles, coming on by fits, but at no certain intervals, unleſs in the night, when the patient is warm in bed. See Bubo.

There are alſo ſcabs and ſcurfs in various parts of the body, which are as yellow as a honeycomb; ſometimes they have large ſurfaces, anſwering the deſcription which authors give of the leproſy. All theſe ſymptoms gradually increaſe, eſpecially the pain, which becomes ſo intenſe that the patient is unable to lie in bed.

Afterward, nodes or exoſtoſes ariſe in the ſkull, ſhinbones, and bones of the arms, which being attended with conſtant pain and inflammation, at length grow carious and putrefied. Phagedenic ulcers likewiſe ſeize various parts of the body, but generally firſt begin with the throat, and from thence gradually creep by the palate to the cartilage of the noſe, which they deſtroy, and the noſe being deſtitute of its prop, falls down flat. The ulcers and pains daily increaſing, the patient ſinks under the torment, and one member rotting away after another, is hurried into his grave.

The methods of curing the French pox are principally four: 1. The common one, by ſalivation. 2. By giving quickſilver-pills. 3. By mercurial frictions, which are to be purged off before a ſalivation is raiſed. And, 4. By ſweating, with a decoction of guaiacum. For the firſt of theſe methods, ſee Salivation.

The ſecond method of curing the French pox is by a quickſilver pill. This was brought into reputation by Belloſte; and, though he has kept the compoſition a ſecret, yet there is no reaſon to doubt but it is quickſilver mixed with a certain proportion of cathartic. Turner's imitation of this pill is as follows: take of quickſilver, two drams; turpentine, and pill of calocynth with aloes, of each half a dram; of which make twelve pills. The quickſilver muſt be well incorporated with the turpentine till it becomes inviſible; and then the pill of calocynth with aloes is to be added: ſometimes it will require a little crabs eyes, to give it a conſiſtence. If one of theſe pills be taken night and morning, after the two firſt days, it will give two or three ſtools a day, without gripes or ſickneſs. It may be proper, either night or morning, after the pill, to ſweat the patient with a pint of the ſtrong decoction of guaiacum, drank hot upon it. In the milder ſpecies of this diſeaſe, the patient is directed to obſerve no particular regimen, but may go about his affairs as uſual. The method of cure, as is allowed, may be preſcribed to very good purpoſe in this ſtubborn diſeaſe; but it is not thought ſo effectual as ſalivation; without which, Turner is of opinion, that exoſtoſes and carious tophi cannot be cured.

The third method of curing the French pox is by mercurial frictions, which Deſault gives as follows: when the patient has a pox of a long continuance, and the venereal poiſon is diſperſed all over the body, he ſhould be

be prepared by bathing and drinking whey. But in a recent pox the bath is not neceſſary. After this, inſtead of raiſing a ſalivation, he brings on a flux of the belly, by means of clyſters of a decoction of ſena, and the pulp of caſſia, before the frictions are adminiſtered. When he finds that the looſeneſs does not anſwer the number of frictions, nor the quantity of mercury made uſe of, he purges the patient with powder of jalap, and procures copious ſtools. While the looſeneſs is going on, the friction does the office of a purge; and in proportion as they are repeated, the flux of the belly revives; and when it ſlackens or ſtops, he has recourſe to the clyſters and purges of jalap. He purſues this method till the ſymptoms ceaſe, and till he is perſuaded, by the abundance of the evacuations, the venereal poiſon is entirely drained off. By this means he carries off the pox and gonorrhœa at once. Dr. Douglas not only approved, but uſed this method with ſucceſs. The frictions are to be made with mercurial ointment, and one third of quickſilver, from two or three drams to an ounce or an ounce and a half, every night or every other night.

The fourth and laſt method of curing this diſtemper is with ſtrong decoctions of guaiacum. This we have the firſt account of, from Sir Ulric Hutten, who purſued it himſelf. A pound of guaiacum is to be boiled in a gallon of ſpring-water, to one half, and the ſcum reſerved to anoint the ſores; and a ſecond decoction is to be uſed for common drink. Boerhaave, who recommends this method, ſuppoſes that a ſalivation will be ineffectual, if every drop of fat in the blood is not melted down into water, and carried off; and the patient reduced to a death-like paleneſs. He likewiſe ſuppoſes that guaiacum performs its taſk by reſolving all the unctuous particles, whether incorporated in the maſs of blood, or accumulated in their proper repoſitories; and by emaciating the habit ſo exquiſitely, as not to leave one drop of oil therein. He directs the patient to keep in a room of ſuch a warmth, as that its mere heat will incline him to ſweat; he adviſes alſo, through the whole courſe of the cure, to abſtain from every thing that has the leaſt oilineſs in its nature, eating nothing but ſea biſcuit and raiſins, and drinking only a weaker decoction of guaiacum. He muſt alſo drink eight ounces every day of the ſtrong decoction, the more the better, till ſome days his habit is bloated with it, as if he had the dropſy. After this, let the patient every morning drink faſting as much of the decoction as his ſtomach will hold, and place himſelf in an erect poſture in a ſweating-box; or if he lies a-bed, let a ſtove be put under it. In either place he muſt receive on his naked body the ſteam of kindled ſpirits of wine, and there let him ſweat as long and as plentifully as his ſtrength will allow. After he has ſuffered this heat for half an hour, let the flame be extinguiſhed, and the patient ſweat in his bed about half an hour longer. After which let him take eight or ten ounces of veal-broth boiled in a ſmall quantity of rice, but void of fat. His body muſt now be carefully wiped with warm dry flannel, after which let him riſe and drink of his decoction, as formerly, throughout the day. This muſt be done morning and evening, in every article, for fourteen days ſucceſſively; after this, in the morning fourteen days more.

PRACTICE, in arithmetic, *Practica Italica*, or Italian uſages, certain compendious ways of working the rule of proportion, or golden rule, eſpecially where the firſt term is one or unity. They were thus called from their expediting of practice and buſineſs, and becauſe firſt introduced by the merchants and negotiants of Italy.

The moſt uſeful of theſe practices are as follow: — 1. Since the uſe of the rule of three is to find a fourth proportional to three given numbers, divide the firſt and ſecond, or the firſt and third, by ſome common number, if that can be done exactly; and work with the quantities in their ſtead: as in the following example:

Price of 3 ℔. is 9 ſhillings: What is the price of 7 ℔?

3) 1 3

$\frac{3}{21}$ facit ſhill.

Price of 14 ℔. is 26 ſhillings: What is the price of 7 ℔?

7) 2 2) —

1

facit 13 ſhillings.

2. If the firſt term be 1, and the ſecond an aliquot part of a pound, ſhilling, or penny; divide the third by the aliquot part, the quotient is the anſwer.

Note, to find the aliquot part, thoſe who cannot do it otherwiſe, may ſee the table of aliquot parts of a pound in table hereafter.

E. gr. If 1 ell coſt 10 ſhillings: What coſt 957 ells?

facit 478 l. 10 ſhillings.

3. If the firſt or third number be 1; the other not exceeding large; and the middle term a compound, i. e. conſiſt of ſeveral denominations, it may be wrought without reduction, thus:

Price of 1 ℔. is 3 s. 8 d. 3 q. What is the price of 5 ℔?

5

18 s. 7 d. 3 q.

For, four farthings making a penny, 5 times 3 farthings make 3 d. 3 q. and 12 d. making 1 s. 5 times 8 pence make 3 s. 4 d. which, with the 3 d. from the place of farthings, make 3 s. 7 d. Laſtly, 5 times 3 ſhillings make 15, and with the 3 ſhillings from the place of pence is 18 s. the price required therefore is 18 s. 7 d. 3 q.

4. If the middle term be not an aliquot, but an aliquant part, reſolve the aliquant part into its aliquot parts; divide the middle term by the ſeveral aliquots, the ſum of the quotients is the anſwer. To find the aliquot parts contained in an aliquant, ſee the table of aliquant parts of a pound, hereafter.

For an inſtance of this rule: If 1 ell coſt 15 ſhillings: What coſt 124 ells?

$\frac{1}{2}$ $\frac{1}{4}$

$\frac{1}{2}$) 62

31

facit 93 l.

5. If the firſt or ſecond term be 1, and in the former caſe the ſecond or third, in the latter the firſt, be reſolvible in factors; the whole operation may be performed in the mind without writing down any figures; as in the following example:

Price of 1 ℔. is 24 ſhillings: What is the price of 20 ℔.

4 4

6 80

6

facit 48 : 0 s. — 24 l.

6. Where one of the given numbers is 1, we have ſeveral compendious uſages to ſave multiplication and diviſion. E. gr. If 9 ℔. coſt 20 ſhillings: What does 1 ℔. coſt?

It is obvious the ſum required is had by adding to the tenth part of 20 s. viz. 2 s. the ninth part of the tenth, viz. 3 d. $\frac{1}{2}$, and $\frac{2}{9}$ of a penny; the anſwer therefore is 2 s. 3 d. $\frac{1}{2}$ and $\frac{2}{9}$.

Again, if 5 ℔. coſt 64 s. What coſt 1 ℔?

Since 5 is half of 10, the double of the tenth part of the given price, viz. 10 s. 9 d. 3 q is the ſum required.

Again, if 1 ℔. coſt 18 d. What will 19 ℔. coſt?

Since 19 = 20 — 1; from the given price doubled and increaſed by a cypher, viz. 360, ſubtract the ſimple 18; the remainder is 342 pence = 28 s. 6 d. the ſum required.

7. If two terms of the ſame denomination differ by an unit, we have a peculiar kind of compound, which will be clear from the following examples. E. gr. If 5 ℔. coſt 30 s. What will 4 ℔. coſt?

Since the price of 4 ℔. is $\frac{1}{5}$ part ſhort of that of 5 ℔. divide the given price 30 by 5; the quotient 6 being ſubtracted from the dividend, the remainder, viz. 24 s. is the ſum required.

Again, if 8 ℔. coſt 24 s. What coſt 9 pounds?

Since the price of 9 ℔. exceeds that of 8 by $\frac{1}{8}$ part, divide the given price 24 by 8, and add the quotient 3 to the dividend; the ſum 27 is the anſwer.

8. Sometimes one may uſe ſeveral of theſe compends or practices in the ſame queſtion. E. gr. If 100 ℔. coſt 30 s. 4 d. What coſt 50 ℔? 50) 2. 2

facit 15 s. 2 d.

Again, if 60 ℔. coſt 4 s. What coſt 2520 ℔?

6 42

24 6

7 7

168 l.

A table

A table of the aliquot parts of a pound or 20 s. are

10 s. make half of 20 s.	2 s. 6 d. an eighth.
5 s. a fourth.	1 s. 8 d. a twelfth.
4 s. a fifth.	1 s. 4 d. a fifteenth.
2 s. a tenth.	1 s. 3 d. a ſixteenth.
1 s. a twentieth.	10 d. a twenty-fourth.
6 s. 8 d. a third.	5 d. a forty-eighth.
3 s. 4 d. a ſixth.	

To multiply by aliquot parts, ſee the article MULTIPLICATION.

A table of the aliquant parts of a pound or 20 s. are

3 s. an aliquant part compoſed of a 10th and 20th.	14 s. of a half and a 5th.
6 s. of a fifth and tenth.	15 s. of a half and a 4th.
7 s. of a fourth and tenth.	16 s. of a half a 5th & 10th.
8 s. of two fifths.	17 s. of a half a 4th & 10th.
9 s. of a fourth and fifth.	18 s. of a half and two 5ths.
11 s. of a half and a 20th.	19 s. of a half, a 4th, and a 5th.
12 s. of a half and a 10th.	

To multiply by aliquant parts, ſee the article MULTIPLICATION.

PRAGMATIC SANCTION, in the civil law, is defined by Hottoman to be a reſcript, or anſwer of the ſovereign, delivered by advice of his council, to ſome college, order, or body of people, upon conſulting him on ſome caſe of their community. The like anſwer given to any particular perſon, is called ſimple reſcript. The term pragmatic ſanction, is chiefly applied to a ſettlement of Charles VI. emperor of Germany, who, in the year 1722, having no ſons, ſettled his hereditary dominions on his eldeſt daughter, the archduchess Maria Thereſa, which was confirmed by the diet of the empire, and guarantied by Great-Britain, France, the States-General, and moſt of the powers in Europe.

PRAME, among ſailors, a ſort of lighter employed in different parts of the Baltic ſea, to load and deliver ſhips. See CRAFT and LIGHTER.

PRASIUS, PRASITES, in natural hiſtory, the name of a gem much approaching to the nature of the emerald, but wanting its hardneſs, and being of a coarſer green, with an admixture of yellow.

PRATIQUE, or PRATTIC, in commerce, a negociation, or communication, of commerce, which a merchant veſſel obtains in the port it arrives in, and the countries it diſcovers: hence to obtain a pratique, is to obtain a liberty to frequent a port, to go aſhore, to buy and ſell, &c.

Pratique is particularly uſed for a licenſe to traffic, granted to the maſter of a ſhip in the ports of Italy upon a bill of health; that is, a certificate that the place whence he came is not annoyed with any infectious diſeaſe.

PRAYER, in theology, a petition put up to God, either for the obtaining ſome future favour, or the returning thanks for a paſt one.

Divines diſtinguiſh three kinds of prayer, vocal, which is cloathed in words and ſounds, to be uttered by the mouth; mental, which is only formed or conceived in the mind, and not delivered in words; and ejaculatory, which is a ſhort ſudden flight, without ſtudy, order, or method. Among us prayer is moſt frequently conſidered under the diviſions of preconceived and extemporary: under the firſt come all ſet forms, whether public or private, by which the mind is directed in the order, manner, expreſſion, &c. of its petitions; the ſecond is that where the mind is left to itſelf, and its own conduct, both as to matter, manner, words, &c.

PREACHING, in theology, the promulgation of the word of God in public: or the making a ſermon, or public oration on ſome paſſage in the ſacred Scriptures, in order to inform the judgment and mend the lives of the hearers.

PREADAMITE, a denomination given to the inhabitants of the earth, who, according to ſome people, lived before Adam.

Iſaac de Pereyra, in 1655, publiſhed a book, in which he attempted to prove that the Jews alone were deſcended from Adam; and that the Gentiles, whom he called Preadamites, lived long before Adam: this book was anſwered by Demarets, profeſſor of theology at Groningen.

PREAMBLE, in law, the beginning of an act of parliament, &c. which ſerves to open the intent of the act, and the miſchiefs intended to be remedied by it.

PREBEND, the maintenance a prebendary receives out of the eſtate of a cathedral or collegiate church. Prebends are diſtinguiſhed into ſimple and dignitary; a ſimple prebend has no more than the revenue for its ſupport; but a prebend with dignity, has always a juriſdiction annexed to it.

PREBENDARY, an eccleſiaſtic who enjoys a prebend.

The difference between a prebendary and a canon is, that the former receives his prebend, in conſideration of his officiating in the church; but the latter merely by his being received into the cathedral or college.

Golden PREBENDARY *of Hereford*, called alſo *Prebendarius Epiſcopus*, is one of the twenty-eight minor prebendaries, who has, *ex officio*, the firſt canon's place that falls. He was anciently confeſſor of the biſhop and cathedral, and had the offerings at the altar; on which account he was called the golden prebendary.

PRECEDENCE, or PRECEDENCY, a place of honour to which a perſon is entitled: this is either of courteſy or of right. The former is that which is due to age, eſtate, &c. which is regulated by cuſtom and civility: the latter is ſettled by authority, and when broken in upon gives an action at law.

PRECEDENT, in law, a caſe which has been determined, and which ſerves as a rule for all of the ſame nature: thus the precedents of a court will reverſe a judgment contrary to many precedents.

PRECENTOR, a dignitary in cathedrals, popularly called the chantor, or maſter of the choir.

PRECEPT, in law, a command in writing ſent by a chief juſtice, juſtice of the peace, &c. for bringing a perſon, record, or other matter, before him.

PRECESSION, *Præceſſio*, in aſtronomy, a term applied to a ſlow motion of the equinoctial points towards the weſt: that is, in the language of aſtronomers, *in antecedentia*, or contrary to the order of the ſigns.

This motion of the equinoctial points is occaſioned by the poles of the world revolving round thoſe of the ecliptic; in order to illuſtrate which, let D C H (plate CIII. *fig.* 11.) be a part of the earth's orbit, C its center, E C the axis of the ecliptic, E its pole, C P the axis of the earth, P its pole; through the points E and P draw the great circle E P A, meeting the ecliptic A L in A; the arch P A is equal to the inclination of the axis of the earth to the plane of the ecliptic, viz. the angle P C H, which is found by obſervation to be about 66° 30′, and therefore its complemental arch E P, or angle P C E = 23° 30′.

Through the pole P, from the point E, deſcribe a leſſer circle P F G, which will be parallel to the ecliptic; then, if the axis of the earth be directed at any particular time to P, it is found by obſervations of many years, that it will not be conſtantly directed to the point P, but in ſeventy-two years time be directed to ſome other point Q, ſo that the arch P Q = 1 degree; and therefore, in the ſpace of 360 × 72 = 25920 years, the point P, or pole of the world, will deſcribe the circle P F G, about the pole of the ecliptic E, which revolution is called *annus magnus*, the great year; after which, the ſtars being re-inſtated in their proper places, the ancients imagined there would be a total renovation of all things.

The cauſe of this conical motion of the earth's axis was unknown to all the aſtronomers before Sir Iſaac Newton's time, none of them being able to gueſs from whence it could proceed; but this ſublime geometer ſoon inveſtigated its cauſe, and demonſtrated that it reſults from the laws of motion and gravity, that is, from the ſpheroidical figure of the earth; for if the earth was a perfect ſphere, its axis would always continue parallel to itſelf, and conſequently have no ſuch motion. Hence the reaſon of the preceſſion of the equinoctial points may be eaſily conceived: for the circle E P A, paſſing through both the pole of the ecliptic and equator, will be the ſolſtitial colure, and A the ſolſtitial point, when the axis of the earth points to P; but after ſeventy-two years, when it points to Q, then the great circle E Q B will be the ſolſtitial colure, and B the ſolſtice. And becauſe the equi-

noctial points are always ninety degrees distant from the solstices, they must consequently move in the same time, through the same arch, and the same way, viz. westward, *in antecedentia.*

This retrograde motion, by carrying the equinoctial points to meet the sun in his apparent annual motion, makes him arrive at them sooner every year than he would do if those points continued immoveable: and this arch of regression being 50″ a year, or one degree in seventy-two years, makes the equinoxes happen 20′ in time sooner each year than they would otherwise do. And though this change be not sensible in a few years, yet these points are found to have a very different situation from what they had two thousand years ago.

By reason of this precession of the equinoctial points, the fixed stars seem to move towards the east, and thereby to have their longitude, which is always reckoned upon the ecliptic, from the vernal equinoctial point encreased: and hence the constellations seem to have deserted the places allotted them by the ancient astronomers; for instance, the beginning of the sign Aries, which in Hipparchus's time, was near the vernal equinoctial point, and gave name to that point of the ecliptic, is now removed near a whole sign, or thirty degrees eastward; so that Aries is now where Taurus used to be, Taurus where Gemini used to be, &c. and thus all the constellations of the zodiac have changed their ancient places; but to avoid confusion, astronomers have thought fit to let the several portions of the ecliptic, where these constellations were at first observed to be, retain their old names; so that the vernal equinoctial point is still reckoned the first degree of Aries. However, these portions of the ecliptic, where the constellations were at first, are called *anastra*, to distinguish them from the places where they now are, which are termed *stellata.*

PRECIPITANT, *Præcipitans*, in chemistry, is applied to any liquor, which, when poured on a solution, separates what is dissolved, and makes it precipitate, or fall to the bottom of the vessel.

PRECIPITATE, *Præcipitatus*, in chemistry, a substance which having been dissolved in a proper menstruum, is again separated from its solvent, and thrown down to the bottom of the vessel, by pouring some other liquor upon it.

PRECIPITATION, *Precipitatio*, a process in chemistry, which is a kind of separation, whereby the particles of a body dissolved and suspended in any menstruous liquor, are detached therefrom, and fall down to the bottom of the vessel. These particles sometimes precipitate of their own accord, but oftener by the assistance of some other liquor added to the menstruum. So that precipitation is the reseparating solid bodies from any fluid menstruum, wherein they are dissolved, by the addition of a third body, which, counteracting the power of the menstruum, causes that which was dissolved to regain its solid form, and subside in the state of a powder.

The great law of precipitation, according to Dr. Shaw, is this: whenever one body has dissolved another, and a third be added to the solution; which third has a greater relation to either of the former, than they have to each other; then the union of the two first will be dissolved, and the third uniting itself either with the first or second, leaves the other at liberty to fall to the bottom, or rise to the top, according to its specific gravity: thus if camphor be dissolved in spirit of wine, and water be added to the solution, it is thereby made to float upon the surface; because there is a greater appetite of union between water and the spirit of wine, than there is between camphor and that spirit.

As precipitation is apparently opposite to solution, its application must be necessarily founded on the same principles. The manner of its performance is a simple commixture of the precipitant with the solution to be precipitated; only with this caution in respect to bodies which produce much ebullition on their mixture, that the precipitant should be added gradually, lest they overflow the vessel.

Boerhaave makes the following observations on the different manner, in which precipitation is performed by several different agents. 1. By water poured on oils dissolved in alcohol, where the liquor turns milky. 2. By water poured to solid resins dissolved in alcohol, where also the liquor turns milky. 3. By water in the distillation of oily spirits, if any water run after the spirit is drawn off. 4. By acids on acids: thus silver and mercury are precipitated out of spirit of nitre, in which they have been dissolved by adding spirit of salt. 5. By metals with metals, and other bodies. Thus, for example, dilute an ounce of silver dissolved in spirit of nitre, with twelve times the quantity of rain-water; put polished plates of copper into this liquor, and the silver will be precipitated, and the copper dissolved: then put this solution of copper into another glass, and add to it polished plates of iron; the copper will be precipitated, and case over the iron; finally, the copper falls to the bottom, and the iron dissolves. Pour this solution of iron into a fresh glass, and drop upon it oil of tartar per deliquium; the dissolved iron immediately falls to the bottom, and the alkali unites with the acid, and regenerates true nitre, after so many changes. Thus does this salt travel from one body to another almost unaltered, though it is more attracted by one than another, till at length it rests in that which in this respect is the strongest, and is only thence expelled, when oil of vitriol is poured upon the nitre thus regenerated. On these two principles precipitation depends, and is the true and often abstruse cause of numberless wonderful operations, both in art and nature. Take a grain of white or red precipitate, rub it upon a polished and heated copper-plate, and wherever the matter has passed, the copper will immediately look like silver; for the copper attracts the acid of the nitre from the calx of the mercury, and thus presently makes an amalgam upon the surface of the copper, and then acquires a silver colour. 6. Alkalies often precipitate things dissolved by acids. This happens frequently, but not always, nor in perfection: alkali precipitates copper dissolved by an acid, but the copper is afterwards dissolved by a salt made of the two. 7. Acids generally precipitate things dissolved by alkalies; but in this case also there are some processes which shew us exceptions. 8. Sharp salts, without being changed, and lying perfectly concealed, have strange and unexpected effects by means of precipitation. If an ounce of luna cornea, which is perfectly scentless, insipid, and inactive, and affords no sign of acrimony in the fire, be ground, and united in a strong heat in a glass retort with half an ounce of inodorous and perfectly insipid regulus of antimony, there instantly arises an extremely strong poison, or an exceedingly corrosive butter of antimony, the exhalation of which proves mortal. We see in this one instance how dangerous the art of mixing is, and with what care we ought to go about the compounding of bodies.

PRECONTRACT, in law, properly signifies a contract made before another, but is chiefly applied to marriage contracts.

PRECORDIA, *Præcordia*, in anatomy, a general name for the parts situated about the heart, in the forepart of the thorax; as the diaphragm, pericardium, and even the heart itself, with the spleen, lungs, &c.

PRECURSOR, *Præcursor*, in theology, denotes a fore-runner, or person who goes before any one to notify his coming. The term precursor, however, is peculiarly applied to St. John the Baptist, who is styled the precursor of Jesus Christ.

PREDESTINATION, in general, signifies a decree of God, whereby from all eternity he ordained such a concatenation of causes as must produce every event by a kind of fatal necessity, and maugre all opposition.

Nothing has occasioned more disputes than this thorny subject of predestination; the Lutherans speak of it with horror, whilst the Calvinists contend for it with great zeal; the Molinists and Jesuits preach it down as a most dangerous doctrine, whilst the Jansenists assert it as an article of faith; the Arminians, Remonstrants, and Pelagians, are all avowed enemies to predestination.

PREDETERMINATION, in philosophy, that concurrence of God, which determines men in all their actions, both good and evil; and this concurrence, or influence, is called physical predetermination, or premotion: for divines maintain, that God has no share in the

ſins of mankind, inaſmuch as he only affords his concurrence to the phyſical part of their actions, not to the moral part.

PREDIAL TITHES, are thoſe that are paid of things ariſing and growing from the ground only; as corn, hay, fruit, &c.

PREDICABLE, among logicians, denotes a general quality which may be predicated, or aſſerted of ſeveral things: thus animal is predicable of mankind, beaſts, birds, fiſhes, &c.

PREDICAMENT, among logicians, the ſame with category. See CATEGORY.

PREDICATE, *Prædicatum*, in logic, that part of a propoſition which affirms or denies ſomething of the ſubject: thus, in theſe propoſitions, *ſnow is white*, *ink is not white*, whiteneſs is the predicate which is affirmed of ſnow, and denied of ink.

PREDICTION, *Prædictio*, the foretelling of what is to come, either by divine revelation, art, or conjecture.

PREDOMINANT, *Prædominans*, that which prevails, or has ſome ſuperiority, over another thing.

PREENING, in natural hiſtory, the action of birds dreſſing their feathers, to enable them to glide the more readily through the air, &c.

For this purpoſe they have two peculiar glands on their rump, which ſecrete an unctuous matter into a bag that is perforated, out of which the bird occaſionally draws it with its bill.

PRE-EXISTENCE, *Præ-Exiſtentia*, the ſtate of a thing actually in being before another.

PREFACE, *Præfatio*, ſomething introductory to a book, to inform the reader of the deſign, method, &c. obſerved therein; and generally whatever is neceſſary to facilitate the underſtanding of a book.

PREGNANCY, *Graviditas*, the ſtate of a woman who has conceived, or is with child. See GENERATION, CONCEPTION, FOETUS, &c.

PRELATE, an eccleſiaſtic raiſed to ſome eminent and ſuperior dignity in the church; as biſhops, archbiſhops, patriarchs, &c. See BISHOP, &c.

PRELIMINARY, in general, denotes ſomething to be examined and determined, before an affair can be treated of to the purpoſe.

PRELUDE, *Præludium*, in muſic, is uſually a flouriſh or irregular air, which a muſician plays off-hand, to try if his inſtrument be in tune, and ſo lead him into the piece to be played.

PREMISES, or PREMISSES, *Præmiſſæ*, in logic, an appellation given to the two firſt propoſitions of a ſyllogiſm, as going before, or preceding the concluſion.

PREMISES, in law, properly ſignifies the land, &c. mentioned in the beginning of a deed. See the article DEED.

PREMIUM, or *Præmium*, properly ſignifies a reward or recompence; but it is chiefly uſed in a mercantile ſenſe for the ſum of money given to an inſurer whether of ſhips, houſes, lives, &c.

PREMONSTRATENSES, in church hiſtory, a religious order, inſtituted by St. Norbert, about the year 1119.

PREMUNIRE, or *Præmunire*, in law, is taken two ways; either for a writ, or for the offence for which it is granted.

Formerly the church of Rome carried its pretended right of ſupremacy to ſuch a height, that ſeveral ſtatutes were made to check and reſtrain the growing power of the pope; but more eſpecially ſtat. 16 Rich. II. c. 5. commonly known by the name of the ſtatute of premunire, which ordains the puniſhment of offenders on this ſtatute to be this: that they ſhould be out of the king's protection, attached by their bodies, i. e. impriſoned at the king's pleaſure, and loſe their lands, goods, and chattels.

Premunire is now chiefly uſed for the above puniſhment, which is incurred not only by thoſe who aſſert the pope's ſupremacy; but alſo by thoſe who refuſe to take the oath of allegiance, or of the king's ſupremacy, &c.

It is ſaid no perſon, who has incurred a premunire, can bring any action; and a writ of premunire lies as well for a party grieved, as for the king; but the laws making offences a premunire are ſo very ſevere, that they are ſeldom put in execution.

PRENDER, in law, ſignifies the power or right a perſon has to take a thing before it is offered him.

PREPARATION, *Præparatio*, in mathematics, ſomething preparatory to the demonſtration of a propoſition. Thus if a propoſition in geometry is to be demonſtrated, the preparation conſiſts in drawing certain lines; and if a propoſition in arithmetic, in ſome computation to be previouſly made to come at the demonſtration.

PREPARATION, in pharmacy, &c. the manner of preparing and managing any medicine, in order to fit it to ſerve the purpoſe for which it is intended.

PREPARATION, in anatomy, the art of preſerving the parts of animals for anatomical uſes; which is done either by drying them thoroughly, or putting them in a proper liquor.

In drying parts which are thick, when the weather is warm, care muſt be taken to prevent putrefaction, fly-blows, inſects, &c. This is eaſily done by the uſe of a ſolution of corroſive ſublimate in ſpirit of wine, in the proportion of two drams of ſublimate to a pound of ſpirit: the part ſhould be moiſtened with this liquor as it dries, and by this method the body of a child may be kept ſafe even in ſummer. Dried preparations are apt to crack and moulder away in keeping; to prevent this their ſurface ſhould be covered with a thick varniſh, repeated as often as occaſion requires.

Though ſeveral parts prepared dry are uſeful, yet others muſt be ſo managed as to be always flexible, and nearer a natural ſtate; which may be done in a well rectified colourleſs ſpirit of wine, to which is added a ſmall quantity of the ſpirit of vitriol or nitre. When theſe are properly mixed, they neither change their colour nor the conſiſtence of the parts, except where there are ſerous or mucous liquors contained in them. The brain, even of a young child, in this mixture grows ſo firm as to admit of gentle handling, as do alſo the vitreous and cryſtalline humours of the eye. The liquor of the ſebaceous glands and the ſemen are coagulated by this ſpirituous mixture; and it heightens the red colour of the injection of the blood-veſſels, ſo that after the part has been in it a little time, ſeveral veſſels appear which were before inviſible. If you will compare theſe effects with what Ruyſch has ſaid of his balſam, you will find the liquor above-mentioned to come very near to it. The proportion of the two ſpirits muſt be changed according to the part prepared: for the brain and humours of the eye, you muſt put two drachms of ſpirit of nitre to one pound of ſpirit of wine. In preſerving other parts which are harder, thirty or forty drops of the acid will be ſufficient; a larger quantity will make bones flexible, and even diſſolve them. The part thus preſerved ſhould be always kept covered with the liquor, therefore great care ſhould be taken to ſtop the mouth of the glaſs with a waxed cork and a bladder tied over it, to prevent the evaporation of the ſpirit.

Some prefer malt-ſpirit to ſpirit of wine, becauſe this laſt is apt to change into a brown colour; whereas the malt-ſpirit never loſes its limpid appearance.

PREPOSITION, *Præpoſitio*, in grammar, one of the parts of ſpeech, being an indeclinable particle, which yet ſerves to govern the nouns that follow it; ſuch as *per*, *pro*, *propter*; and *through*, *for*, *with*, &c.

PREPUCE, *Præputium*, in anatomy, the foreſkin; being a prolongation of the cutis of the penis, covering the glans.

PREROGATIVE, *Prærogativa*, a pre-eminence which one perſon has over another.

PREROGATIVE *of the King*, *Prærogativa regis*, that power which the king hath, not only over other perſons, but over the ordinary courſe of the common law, in right of his crown.

PREROGATIVE *Court*, a court belonging to the archbiſhop of Canterbury, wherein wills are proved and adminiſtrations granted that belong to the archbiſhop by his prerogative; that is, where the party, at his death, had five pounds, or upwards, out of the dioceſe where he died, and within the archbiſhop's province. See WILL, PROBATE, &c.

PRE-

PRESAGE, *Præſagium*, in antiquity, denotes an augury, or ſign of ſome future event; which was chiefly taken from the flight of birds, the entrails of victims, &c.

Among phyſicians, the term preſage is ſometimes uſed for prognoſtic ſign. See PROGNOSTIC.

PRESBYTA, πρεσβυτης, in optics, a perſon whoſe eyes being flat, can ſee diſtant objects diſtinctly, but thoſe near confuſedly: which defect of ſight got this appellation, becauſe old people are naturally ſubject to it.

Spectacles, or convex glaſſes, are the only remedy for this defect; for if theſe are well fitted to the degree of flatneſs of the eyes, they cauſe the rays of light to converge in ſuch a manner from near objects, as to make them fall exactly on the retina, and thereby produce diſtinct viſion. See the article VISION.

PRESBYTER, in the primitive chriſtian church, an elder, one of the ſecond order of eccleſiaſtics; the other two being biſhops and deacons.

PRESBYTERIANS, a ſect of proteſtants, ſo called from their maintaining that the government of the church appointed in the New Teſtament was by preſbyteries; that is, by miniſters and ruling elders, aſſociated for its government and diſcipline.

PRESCIENCE, in theology, fore-knowledge, or the knowledge which God has of events before they come to paſs.

PRESCRIPTION, in law, is a right or title acquired by uſe and time, introduced for aſſuring the property of effects, in favour of perſons who have for a certain time had them in their poſſeſſion.

PRESCRIPTION, in medicine, is the aſſigning a proper and adequate remedy to a diſeaſe, from an examination of its ſymptoms, and an acquaintance with the virtues and effects of the materia medica.

PRESENT, *Præſens*, in grammar, the firſt tenſe of a verb, expreſſing the preſent time, or that ſomething is now performing; as *ſcribo*, I write, or am writing. See TENSE.

PRESENTATION, in law, the act of a patron offering his clerk to be inſtituted in a benefice of his gift, the ſame being void.

PRESENTE'E, the clerk preſented to a benefice by the patron.

PRESENTMENT, in law, a denunciation of jurors, or a juſtice of the peace, or other officers, without information of an offence inquirable by the court, to which it is preſented; or it may be ſaid to be an information made by the jury in a court before a judge, who has authority to puniſh any offence committed contrary to law; and it is what the grand jury finds and preſents to the court, without any bill of indictment delivered; yet it is afterwards reduced into the form of an indictment.

PRESEPE, or PRÆSEPE, in aſtronomy, the name given to three nebulous ſtars in the breaſt of Cancer.

PRESERVATION, in general, denotes the art of preſerving things in a ſtate of perfection; or, at leaſt, from being ſo far corrupted and ſpoiled, as to be no longer uſeful.

PRESERVATIVE, among phyſicians, denotes a medicine taken by way of precaution; or, to ſecure a man from a diſeaſe that threatens him.

PRESIDENT, *Præſes*, an officer created or elected to preſide over a company, in contradiſtinction to the other members, who are called reſidents.

PRESIDIAL, a bench of judges eſtabliſhed in the ſeveral cities of France, to judge ultimately of all the cauſes brought before them by way of appeal from the ſubaltern judges.

PRESS, *Prelum*, in the mechanic arts, a machine of wood, or iron, ſerving to ſqueeze any body very cloſe. Thus, let A B (plate CIV. *fig.* 1.) be a cheeſe-preſs, where C E, F G, are levers, moving about the points D, E, F, G, by applying the hand at C; S, the ſtone, or weight; and H, the cheeſe to be preſſed. Now if C D $=5$, D E $=2$, F G $=6$, G H $=2$, F R $=1$, F H $=4$; then in the lever C E, D is the fulcrum. Call the power at C 1; then the force at E or F is $\frac{2}{5}$. And in the lever F G, whoſe fulcrum is G, if the power at F be 1, the force at R is $\frac{6}{5}$; and therefore the power at C is to the weight S, as 1 to $\frac{2}{5} \times \frac{6}{5}$, or 3. Alſo the weight of the ſtone at R is to the preſſure at H, as 2 to 5, or 1 to $\frac{5}{2}$; and the power at C is to the preſſure at H, as 1 to $3 \times \frac{5}{2}$, or $7\frac{1}{2}$.

Preſſes uſually conſiſt of ſix pieces; two flat ſmooth planks, between which the things to be preſſed are laid; two ſcrews or worms faſtened to the lower plank, and paſſing through two holes in the upper; and two nuts in form of an S, that ſerve to drive the upper plank, which is moveable, againſt the lower, which is fixed.

PRESSES *uſed for expreſſing Liquors* are in moſt reſpects the ſame with the common preſſes, only the under plank is perforated with a great number of holes for the juice to run through. Others have only one ſcrew, or arbor, paſſing through the middle of the moveable plank, which deſcends into a kind of ſquare box, full of holes, through which the juices flow, as the arbor is turned.

But that the reader may be enabled to form a more diſtinct idea of theſe preſſes, we ſhall give a draught of the common and great wine-preſs uſed for ſqueezing the juice out of grapes.

A B (plate CIV. *fig.* 2.) is the baſe or pedeſtal and other ſupporters of the common wine-preſs. C, C, the cheeks, which are upright beams, the lower extremities of which are ſunk in the earth, where they are ſtrongly fixed by croſs-bars and maſonry: they are traverſed at top by two beams, the lowermoſt of which is the nut, or receptacle of the ſcrew. D is the ſcrew with its wheel. E the bearer, or large piece of timber on which the wheels reſt, in order to ſink the beams croſſing the planks that cover the grapes, F. G, G, the maye, or planks on which the grapes are diſpoſed, in order to be ſqueezed; theſe planks are cut in notches, to receive the liquor and convey it to a veſſel appropriated to receive it. The maye is ſupported on a maſſive work of maſonry. H is the wheel that ſerves to force down the ſcrew and bearer upon the grapes, which are laid upon the maye in a ſquare heap: this it does by winding off the cord from the wheel of the ſcrew D, by which means the ſcrew and the bearer E, are preſſed down upon the grapes, which are uſually covered with croſs-beams reared above each other. I is a leather-pipe, terminating in two wooden tubes, for conveying the wine from one veſſel to another. K is a large bellows to agitate the wine when it has ſettled into an even ſurface in both veſſels. L the ſame bellows in profile. M is a large fountain, which affords a quick flow. And N is a ſtopple to cloſe the veſſel newly filled, and prevent the wine from running over, upon withdrawing the wooden tube.

A B (*fig.* 3.) repreſents the baſe and other ſupports of the great wine-preſs; C, C, &c. the cheeks, or ſide-beams; D, D, great beams, two in number at leaſt, and frequently four, or even ſix; E, the ſcrew; F, the nut of the preſs; G, the wheel, which, by the help of five or ſix men, turns the ſcrew; and H, the cage, which is an aſſemblage of ſeveral ſtrong pieces of timber formed into a ſquare, and lined with maſonry within. This cage is ten feet long, and four and an half broad on each ſide, and may be either raiſed out of, or ſunk into the pit of maſon-work I; from whence it is exhibited as aſcending in the figure referred. It uſually weighs three thouſand pounds; and being ſuſpended in the manner repreſented, forms, in conjunction with the ſcrew, a lever of an immenſe force for ſqueezing down a bearer upon grapes placed upon the maye K, as in the former figure. See the article WINE.

Cyder PRESS. See CYDER.

Oil PRESS. See OIL-MILL.

PRESS *uſed by Joiners* to keep cloſe the pannels, &c. of wainſcot, conſiſts of two ſcrews, and two pieces of wood four or five inches ſquare, and two or three feet long, whereof the holes at two ends ſerve for nuts to the ſcrews.

PRESS *uſed by Inlayers* reſembles the joiners-preſs, only the pieces of wood are thicker, and only one of them moveable; the other, which is in form of a treſſel, being ſuſtained by two legs joined into it at each end.

This ſerves for ſawing and cleaving of wood required in marquetry. See MARQUETRY.

Founders-PRESS, is a ſtrong ſquare frame, conſiſting of four pieces of wood firmly joined together with tenons, &c. It is of various ſizes: two of them are required to each

each mould, at the two extremes whereof they are placed; ſo as that, by driving wooden wedges between the mould and ſides of the preſs, the two parts of the mould for the metal may be preſſed cloſe together. See the article FOUNDERY.

The book-binders-preſs conſiſts of two large wooden cheeks joined by two ſtrong wooden ſcrews; which, being turned by an iron-bar, draw together or ſet aſunder the cheeks at pleaſure. See the article BOOK-BINDER.

The cheeks are placed flat on a wooden ſtand, in form of a cheſt, into which the cuttings fall. A-ſide of the cheeks are two pieces of wood of the ſame length with the ſcrews, ſerving to direct the cheeks. Upon the cheeks is the ſhaft or ſuſt, to which the cutting-knife is faſtened by a ſcrew, which has its key to diſmount it on occaſion.

The ſhaft conſiſts of ſeveral parts; a wooden ſcrew, which catching within the nut of the two feet that ſuſtain it, brings the knife to the paper, which is faſtened in the preſs. This ſcrew, which is pretty long, has two directories, which reſemble thoſe of the ſcrew of the cheeks. To make the ſhaft ſlide ſquare, that foot of the ſhaft where the knife is not fixed, has a kind of groove directed by a thread faſtened along one of the cheeks. Laſtly, the knife is a piece of ſteel ſix or ſeven inches long, pointed a-top, and ſquare all the reſt.

PRESS, in the woollen manufactory, is a large wooden machine, ſerving to preſs cloaths, ſerges, &c. to render them ſmooth, and give them a gloſs. See plate CIV. *fig.* 4. where ND is a preſs with an iron-ſcrew, and KE a preſs with a wooden ſcrew.

The principal parts of this machine are the cheeks of the preſs, marked A, A, &c. the nut, in which the box is fixed, marked B, B; the windlas, C; an iron-ſcrew, D; a wooden ſcrew, E; a female ſcrew, or box, to receive the male one, F; the bed to lay the folded ſtuff on, K; an iron-lantern, L; and a wooden one, M; and N, the ſtuff in the preſs.

PRESS *for Linens, Silks, &c.* is called a calender. See CALENDER.

For the Rolling and Printing PRESS. See the article PRINTING.

PRESSING, in the manufactures, is the violently ſqueezing a cloth, ſtuff, &c. to render it ſmooth and gloſſy.

There are two methods of preſſing, viz. cold or hot.

As to the former, or cold preſſing, after the ſtuff has been ſcoured, fulled, and ſhorn, it is folded ſquare in equal plaits, and a ſkin of vellum, or paſteboard, put between each plait. Over the whole is laid a ſquare wooden plank, and ſo put into the preſs; which is ſcrewed down tight by means of a lever. After it has lain a ſufficient time in the preſs, they take it out, removing the paſteboards, and lay it up to keep.

Some only lay the ſtuff on a firm table, after plaiting and paſteboarding, cover the whole with a wooden plank, and load it with a proper weight.

The method of preſſing hot is this: when the ſtuff has received the above preparations, it is ſprinkled a little with water, ſometimes gum-water, then plaited equally, and between each two plaits are put leaves of paſteboard; and between every ſixth or ſeventh plait, as well as over the whole, an iron or braſs-plate well heated in a kind of furnace. This done, it is laid upon the preſs, and forcibly ſcrewed down.

Under this preſs are laid five, ſix, &c. pieces at the ſame time, all furniſhed with their paſteboards and iron-plates. When the plates are well cold, the ſtuffs are taken out and ſtitched a little together to keep them in the plaits.

This manner of preſſing was only invented to cover the defects of the ſtuffs; and accordingly it has been frequently prohibited.

PRESSURE, or PRESSION, in general, denotes the ſqueezing a thing cloſe together. See the articles FLUID, AIR, &c.

PREST, a duty in money paid by the ſheriff upon his account in the exchequer, for money remaining in his hands.

PREST-MONEY, the money given to new liſted ſoldiers, ſo called becauſe it binds thoſe who receive it, to be ready at all times.

PRESTATION ſignifies the payment of a certain ſum by arch-deacons, and other clergymen, annually to their biſhop.

PRESTER, in phyſiology, a meteor conſiſting of an exhalation, thrown from the clouds downwards with ſuch violence, as by the colliſion it is ſet on fire. It differs from the thunderbolt in the manner of its inflammation, and its burning and breaking every thing it touches with greater vehemence.

PRESTO, in the Italian muſic, intimates to perform very quick, as *preſtiſſimo* does extremely ſo.

PRESUMPTION, in law, ſignifies an opinion or belief of a thing.

PRESUMPTIVE HEIR, the ſame with heir at law. See HEIR.

PRETERIT, *Præteritum*, in grammar, a tenſe which expreſſes the time paſt, or an action completely finiſhed; as, *ſcripſi*, I have wrote.

PRETERITION, in rhetoric, a figure whereby, in pretending to paſs over a thing untouched, we take a ſummary view of it.

PRETEXT, a colour or motive, whether real or feigned, for doing ſomething.

PRETOR, or PRÆTOR, a magiſtrate among the ancient Romans, not unlike our lord chief juſtices, or lord chancellor, or both in one; as being veſted with the power of diſtributing juſtice among the citizens.

PRETORIAN GUARDS, *Prætoriæ Cohortæ*, in Roman antiquity, were the emperor's guards, who at length were increaſed to ten thouſand; they had this denomination, according to ſome, from their being ſtationed at a place in the palace called Pretorium: their commander was ſtyled *præfectus prætorii*.

PRETORIUM, *Prætorium*, among the Romans, denoted the hall or court wherein the pretor lived, and wherein he adminiſtered juſtice.

PREVENTER, among ſeamen, a term given to ſeveral ropes whoſe uſes are to ſupply the places of others, which may be carried away by the great force which they ſuſtain, as

PREVENTER-BRACE implies an additional or ſtrengthening brace to ſupport the yard, and act in concert with the common braces, when the yard ſuffers an extraordinary ſtrain, as by a weight of ſail in a quartering wind. See BRACE.

PREVENTER-SHROUD, and PREVENTER-STAY, alſo denote thoſe which are placed to ſupport and co-operate with the common ones. See the articles SHROUD and STAY.

PRIAPISM, πριαπισμος, in medicine, a continual and painful erection of the penis.

PRIAPUS, in medicine, denotes the genital parts in men.

It denotes, in antiquity, a fabulous deity, revered very much for the extraordinary ſize of his parts.

PRICKING, in the ſea-language, is to make a point on the plat or chart, near about where the ſhip then is, or is to be at ſuch a time, in order to find the courſe they are to ſteer.

PRIEST, *Sacerdos*, a perſon ſet apart for the performance of ſacrifice, and other offices of religion.

PRIEST, *Preſbyter*, in the Chriſtian church, is a perſon inveſted with holy orders; in virtue of which he has a power to preach, marry, adminiſter the ſacraments, &c.

PRIMÆ VIÆ, among phyſicians, denote the whole alimentary duct; including the oeſophagus, ſtomach, and inteſtines, with their appendages.

PRIMAGE, in commerce, a ſmall duty at the water-ſide, uſually about twelve-pence per ton, or ſix-pence a bale, due to the maſter and mariners of a ſhip; to the maſter, for the uſe of ropes, &c. to diſcharge the goods; and to the mariners, for the loading or unloading of the veſſel.

PRIMARY-PLANET, in aſtronomy, one that revolves round the ſun as a center.

PRIMATE, *Primas*, in church-polity, an arch-biſhop who is inveſted with a juriſdiction over other biſhops.

PRIME, *Primus*, an appellation given to whatever is firſt in order, degree, or dignity, among ſeveral things of the

5 JA 59

the ſame or like kind; thus, we ſay, the prime miniſter, prime coſt, &c.

PRIME is ſometimes uſed to denote the ſame with decimal, or the tenth part of an unit. See the article DECIMAL.

In weights, it ſtands for the twenty-fourth part of a grain. See the articles WEIGHT and GRAIN.

PRIME *Figure*, in geometry, one which cannot be divided into any other figures more ſimple than itſelf, as a triangle among planes, and the pyramid among ſolids. See FIGURE.

For PRIME *Numbers*, in arithmetic, ſee the article NUMBER.

PRIME *of the Moon* is the new moon, when ſhe firſt appears, which is about three days after the change. See MOON, and GOLDEN *Number*.

PRIME *Vertical* is that vertical circle, which paſſes through the poles of the meridian, or the eaſt and weſt points of the horizon; whence dials projected on the plane of this circle are called prime vertical, or north and ſouth dials.

PRIMING, or *Prime of a Gun*, is the gunpower put into the pan or touch-hole of a piece, to give it fire thereby. And this is the laſt thing done in charging.

PRIMING, among painters, ſignifies the laying on of the firſt colour.

PRIMITIÆ, the firſt fruits gathered of the earth, of which the ancients made preſents to the gods.

PRIMITIVE, in grammar, is a root or original word in a language, in contradiſtinction to derivative: thus, *God* is a primitive, *godly* derivative, and *god-like* a compound.

PRIMOGENITURE, *Primogenitura*, the right of firſt-born.

PRIMUM MOBILE, in the Ptolemaic ſyſtem of aſtronomy. See MOBILE.

PRINCE, *Princeps*, in polity, a perſon inveſted with the ſupreme command of a ſtate, independent of any ſuperior.

PRINCE alſo denotes a perſon who is a ſovereign in his own territories, yet holds of ſome other as his ſuperior.

PRINCE *of the Senate*, in old Rome, the perſon who was called over firſt in the roll of ſenators, whenever it was renewed by the cenſors: he was always of conſular and cenſorian dignity. See SENATE.

PRINCE'S FEATHER, in botany, the ſame with amaranth. See AMARANTHUS.

PRINCIPAL, *Principalis*, the chief and moſt neceſſary part of a thing.

In commerce, principal is the capital of a ſum due or lent, ſo called in oppoſition to intereſt.

It alſo denotes the firſt fund put by partners into a common ſtock, by which it is diſtinguiſhed from the calls or acceſſions afterwards required.

PRINCIPAL *Point*, in perſpective, is a point in the perſpective plane, upon which a line drawn from the eye perpendicular to the plane falls. It is in the interſection of the horizontal and vertical plane, and called the point of ſight and point of the eye.

PRINCIPAL RAY, in perſpective, that which paſſes perpendicularly from the ſpectator's eye to the perſpective plane.

PRINCIPLE, *Principium*, in general, is uſed for the cauſe, ſource, or origin of any thing.

PRINCIPLES, in phyſics, are often confounded with elements, or the firſt and ſimpleſt parts whereof natural bodies are compounded, and into which they are again reſolvible by the force of fire. See ELEMENT.

PRINT, the impreſſion taken from a copper-plate.

A print may be taken off, ſo as that the out-lines and principal ſtrokes may be exactly copied for graving, in the following manner. If the print be not above a year or two old, the paper need only be well moiſtened with water, as for printing; but if it be more ancient, it ſhould be laid to ſoak all night in water, and afterwards hung in the air till it becomes dry enough for the preſs. The paper thus prepared is to be laid with its printed ſide next the plate, thinly caſed over with white wax; and is thus to be communicated to the rolling-preſs, whereby an impreſſion of the cut will be gained.

PRINTER, a perſon who compoſes and takes impreſſions from moveable characters ranged in order, or from plates engraven, by means of ink, and a preſs; or from blocks of wood cut in flowers, &c. and taken off in various colours on calicoes, linens, ſilks, &c.

PRINTING, the art of taking impreſſions from characters or figures moveable, or immoveable, on paper, linen, ſilk, &c. There are three kinds of printing; the one from moveable letters for books; the other from copper-plates for pictures; and the laſt from blocks, in which the repreſentation of birds, flowers, &c. are cut for printing calicoes, linens, &c. the firſt called common preſs-printing, the ſecond rolling preſs-printing, and the laſt calicoe, &c. printing. The principal difference between the three conſiſts in this, that the firſt is caſt in relievo in diſtinct pieces, the ſecond engraven in creux, and the third cut in relievo, and generally ſtamped, by placing the block upon the material to be printed, and ſtriking upon the back of it.

Progreſs of PRINTING. Who the firſt inventors of the European method of printing books were, in what city, and what year it was ſet on foot, are queſtions long diſputed among the learned. In effect, as the Grecian cities contended for the birth of Homer, ſo do the German printers for that of printing. Mentz, Haerlem, and Straſburg, are the warmeſt on this point of honour, and theſe are left in poſſeſſion of the queſtion, which is not yet decided; though it muſt be owned that Mentz has always had the majority of voices. John Guttemburg, and John Fuſt, of Mentz; John Meutel of Straſburg, and L. John Koſter of Haerlem, are the perſons to whom this honour is ſeverally aſcribed, by their reſpective countrymen; and they have all their advocates among the learned. However, their firſt eſſays were made on wooden blocks, after the Chineſe manner. The book at Haerlem, the vocabulary called Catholicon, and the pieces in the Bodleian library, and that of Bennet-college, are all performed in this way; and the impreſſion appears to have been only given on one ſide of the leaves; after which the two blank ſides were paſted together. But they ſoon found the inconveniences of this method, and therefore bethought themſelves of an improvement; which was by making ſingle letters diſtinct from one another, and theſe being firſt done in wood gave room for a ſecond improvement, which was the making them of metal; and, in order to that, forming moulds, matrices, &c. for caſting them. See LETTER.

From this ingenous contrivance we ought to date the origin of the preſent art of printing, contradiſtinguiſhed from the method practiſed by the Chineſe. And of this Schoeffer, or Scheffer, firſt ſervant, and afterwards partner and ſon in-law of Fuſt, at Mentz, above-mentioned, is pretty generally allowed to be the inventor; ſo that he may properly be reckoned the firſt printer, and the Bible, which was printed with moveable letters in 1450, the firſt printed book; the next was Auguſtine *De Civitate Dei*, then Tully's Offices, printed about the year 1461. In theſe books they left the places of the initial letters blank, and gave them to the illuminers to have them ornamented and painted in gold and azure, in order to render the work more beautiful, and, as ſome think, to make their books paſs for manuſcripts. Thus at preſent in ſome curious works, the initial letter at the beginning of a book, or chapter, is ſometimes left out, and a ſpace is left for its being afterwards printed with various ornaments from a copper-plate.

Some authors tell us, that Fuſt carrying a parcel of Bibles with him to Paris, and offering them to ſale as manuſcripts; the French, upon conſidering the number of books, and their exact conformity to each other, even to a point, and that it was impoſſible for the beſt book-writers to be ſo exact, concluded there was witch-craft in the caſe, and, by their actually indicting him as a conjurer, or threatening to do ſo, extorted from him the ſecret: and hence the origin of the popular ſtory of Dr. Fauſtus.

From Mentz, the art of printing ſoon ſpread itſelf throughout a good part of Europe; Haerlem and Straſburg had it very early; which, as the current of authors repreſent it, occaſioned their pretending to the honour of the invention. From Haerlem it paſſed to Rome in 1467;

and into England in 1468, by means of Tho. Bourchier, archbiſhop of Canterbury, who ſent W. Turner, maſter of the robes, and W. Caxton, merchant, to Haerlem to learn the art. Theſe privately prevailing with Corſeilles, an under workman, to come over, a preſs was ſet up at Oxford, and an edition of Ruffinus on the Creed was printed the ſame year in octavo. From Oxford, Caxton brought it to London about the year 1470, and the ſame year it was carried to Paris. Hitherto there had been nothing printed but in Latin, and the vulgar tongues; and this firſt in Roman characters, then in Gothic, and at laſt in Italic: but in 1480, the Italians caſt a ſet of Greek types, and they have alſo the honour of the firſt Hebrew editions, which were printed about the ſame time with the Greek. Towards the end of the ſixteenth century there appeared various editions of books in Syriac, Arabic, Perſian, Armenian, Coptic, or Egyptian characters, ſome to gratify the curioſity of the learned, and others for the uſe of the Chriſtians of the Levant. Out of Europe the art of printing has been carried into the three other parts of the world: for Aſia, we ſee impreſſions of books at Goa, and in the Philippines; at Morocco, for Africa; at Mexico, Lima, Philadelphia, New York, Boſton, &c. for America. The Turks, indeed, rigorouſly prohibit printing throughout their empire, as imagining that the too frequent communication with books might occaſion ſome change in their religion and government; yet the Jews have ſeveral editions of their books printed at Theſſalonia, and even at Conſtantinople.

Method of PRINTING. The printing-letters or types, as they are ſometimes called, we have already taken notice of, and have deſcribed the method of forming and caſting them under the articles LETTER and LETTER-FOUNDERY.

The workmen employed in the art of printing are of two kinds; compoſitors, who range and diſpoſe the letters into words, lines, pages, &c. according to the copy delivered them by the author; and preſſmen, who apply ink upon the ſame, and take off the impreſſion. The types being caſt, the compoſitor diſtributes each kind by itſelf among the diviſions of two wooden frames, an upper and an under one, called caſes; each of which is divided into little cells or boxes. Thoſe of the upper caſe are in number ninety-eight; theſe are all of the ſame ſize, and in them are diſpoſed the capitals, ſmall-capitals, accented letters, figures, &c. the capitals being placed in alphabetical order. In the cells of the lower caſe, which are fifty-four, are placed the ſmall letters with the points, ſpaces, &c. The boxes are here of different ſizes, the largeſt being for the letters moſt uſed; and theſe boxes are not in alphabetical order, but the cells which contain the letters oftenеſt wanted, are neareſt the compoſitor's hand. Each caſe is placed a little aſlope, that the compoſitor may the more eaſily reach the upper boxes. The inſtrument in which the letters are ſet is called a compoſing-ſtick, ſee plate CIV. *fig.* 5. which conſiſts of a long and narrow plate of braſs or iron, &c. *c c*, on the right ſide of which ariſes a ledge *b b*, which runs the whole length of the plate, and ſerves to ſuſtain the letters, the ſides of which are to reſt againſt it: along this ledge is a row of holes, which ſerves for introducing the ſcrew *f*, in order to lengthen or ſhorten the extent of the line, by moving the ſliders *e*, *d*, farther from, or nearer to, the ſhort ledge at the end *a*. Where marginal notes are required in a work, the two ſliding pieces *e*, *d*, are opened to a proper diſtance from each other; in ſuch a manner as that while the diſtance between *d* and *c* forms the length of the line in the text, the diſtance between the two ſliding pieces forms the length of the lines for the notes on the ſide of the page. Before the compoſitor proceeds to compoſe, he puts a rule, or thin ſlip of braſs-plate, cut to the length of the line, and of the ſame height as the letter, in the compoſing ſtick, againſt the ledge, for the letter to bear againſt. Things thus prepared, the compoſitor having the copy lying before him, and his ſtick in his left hand, his thumb being over the ſlider *d*; with the right he takes up the letters, ſpaces, &c. one by one, and places them againſt the rule, while he ſupports them with his left thumb, by preſſing them to the end of the ſlider *d*; the other hand being conſtantly employed in ſetting in more letters: the whole being performed with a degree of expedition and addreſs not eaſy to be imagined.

A line being thus compoſed, if it end with a word or ſyllable, and exactly fill the meaſure, there needs no farther care; otherwiſe more ſpaces are to be put in, or elſe the diſtances leſſened between the ſeveral words, in order to make the meaſure quite full; ſo that every line may end even. The ſpaces here uſed are pieces of metal exactly ſhaped like the ſhanks of the letters; theſe are of various thickneſſes, and ſerve to ſupport the letters, and to preſerve a proper diſtance between the words; but not reaching ſo high as the letters, they make no impreſſion when the work is printed. The firſt line being thus finiſhed, the compoſitor proceeds to the next; in order to which he moves the braſs-rule from behind the former, and places it before it, and thus compoſes another line againſt it, after the ſame manner as before: going on thus till his ſtick is full, when he empties all the lines contained in it into the gally. See GALLY.

The compoſitor then fills and empties his compoſing ſtick, as before, till a complete page be formed, when he ties it up with a cord or packthread, and ſetting it by, proceeds to the next, till the number of pages to be contained in a ſheet is completed: which done, he carries them to the impoſing-ſtone, there to be ranged in order, and faſtened together in a frame called a chaſe, and this is termed impoſing. The chaſe is a rectangular iron-frame, of different dimenſions, according to the ſize of the paper to be printed, having two croſs pieces of the ſame metal, called a long and ſhort-croſs, mortiſed at each end ſo as to be taken out occaſionally. By the different ſituation of theſe croſſes the chaſe is fitted for different volumes: for quartos and octaves, one tranſverſes the middle lengthwiſe, the other broadwiſe, ſo as to interſect each other in the center: for twelves and twenty-fours, the ſhort croſs is ſhifted nearer to one end of the chaſe: for folios, the long croſs is left entirely out, and the ſhort one left in the middle; and for broad-ſides, both croſſes are ſet aſide.

To dreſs the chaſe, or range and fix the pages therein, the compoſitor makes uſe of a ſet of furniture, conſiſting of ſlips of wood of different dimenſions, and about half an inch high, that they may be lower than the letters: ſome of theſe are placed at the top of the pages, and called head-ſticks; others between them to form the inner margin; others on the ſides of the croſſes to form the outer margin, where the paper is to be doubled; and others in the form of wedges to the ſides and bottom of the pages. Thus all the pages being placed at their proper diſtances, and ſecured from being injured by the chaſe and furniture placed about them; they are all united, and faſtened together by driving ſmall pieces of wood called quoins, cut in the wedge-form, up between the ſlanting ſide of the foot and ſide ſticks and the chaſe, by means of a piece of hard wood and a mallet; and all being thus bound faſt together, ſo that none of the letters will fall out, it is ready to be committed to the preſſman. In this condition the work is called a form; and as there are two of theſe forms required for every ſheet, when both ſides are to be printed, it is neceſſary the diſtances between the pages in each form ſhould be placed with ſuch exactneſs, that the impreſſion of the pages in one form ſhall fall exactly on the back of the pages of the other, which is called regiſter.

As it is impoſſible but that there muſt be ſome miſtakes in the work, either through the overſight of the compoſitor, or by the caſual tranſpoſition of letters in the caſes; a ſheet is printed off, which is called a proof, and given to the corrector; who reading it over, and rectifying it by the copy, by making the alterations in the margin, it is delivered back to the compoſitor to be corrected. For the characters uſed in correcting a ſheet for the compoſitor, ſee CORRECTION.

The compoſitor, then unlocking the form upon the correcting-ſtone, by looſening the quoins or wedges which bound the letters together, rectifies the miſtakes by picking out the faulty or wrong letters with a ſlender ſharp-pointed ſteel-bodkin, and puts others into their places; but when there are conſiderable alterations, and particularly where inſertions or omiſſions are to be made, he

he is under a neceſſity of over-running. Thus, if one or more words to be inſerted in a line cannot be got in, by changing the ſpaces of a line for leſſer ones, part of the line muſt be put back into the cloſe of the preceding one, or forward into the beginning of the ſubſequent one, and this continued till the words are got in. After this another proof is made, ſent to the author, and corrected as before; and, laſtly, there is another proof, called a reviſe, which is made in order to ſee whether all the miſtakes marked in the laſt proof are corrected.

The preſſman's buſineſs is to work off the forms thus prepared and corrected by the compoſitor; in doing which there are four things required, paper, ink, balls, and a preſs. To prepare the paper for uſe, it is to be firſt wetted by dipping ſeveral ſheets together in water: theſe are afterwards laid in a heap over each other; and to make them take the water equally, they are all preſſed cloſe down with a weight at the top. The ink is made of oil and lamp-black, for the manner of preparing which, ſee *Printing* INK.

The balls by which the ink is applied on the forms, are a kind of wooden funnels with handles, the cavities of which are filled with wool or hair, as is alſo a piece of alum-leather or pelt nailed over the cavity, and made extremely ſoft by ſoaking in urine, and by being well rubbed. One of theſe the preſſman takes in each hand, and applying one of them to the ink-block, dabbs and works them together to diſtribute the ink equally, and then blackens the form which is placed on the preſs, by beating with the balls upon the face of the letter.

The printing-preſs repreſented in plate CIV. *fig.* 6. is a very curious, tho' complex machine; the body conſiſts of two ſtrong cheeks *a a*, placed perpendicularly, and joined together by four croſs-pieces; the cap *b*; the head *c*, which is moveable, being partly ſuſtained by two iron-pins, or long bolts, that paſs the cap; the ſhelves *d d*, which ſerve to keep ſteady a part called the hoſe, and the winter *e*, which bears the carriage, and ſuſtains the effort of the preſs beneath. The ſpindle *f* is an upright piece of iron pointed with ſteel, having a male-ſcrew which goes into the female one in the head about four inches. Through the eye *g* of this ſpindle is faſtened the bar *k*, by which the preſſman makes the impreſſion. Part of the ſpindle is incloſed in a ſquare wooden frame called the hoſe, *h*, and its point works into a braſs-pan ſupplied with oil, which is fixed to an iron-plate let into the top of the platten. At each corner of the hoſe, there is an iron-hook faſtened with pack-thread to thoſe at each corner of the platten *i*, in ſuch a manner as to keep it perfectly level. The carriage *l l* is placed a foot below the platten, having its fore-part ſupported by a prop called the fore-ſtay, while the other reſts on the winter. On this carriage, which ſuſtains the plank, are nailed two long iron-bars or ribs, and on the plank are nailed ſhort pieces of iron or ſteel called cramp-irons, equally tempered with the ribs, and which ſlide upon them when the plank is turned in or out. Under the carriage is fixed a long piece of iron called the ſpit, with a double wheel in the middle, round which leather-girts are faſtened, nailed to each end of the plank; and to the outſide of the ſpit is fixed a rounce *m*, or handle to turn round the wheel. Upon the plank is a ſquare frame or coffin, in which is incloſed a poliſhed ſtone on which the form *n* is laid; at the end of the coffin are three frames, viz. the two tympans and friſket: the tympans *o* are ſquare, and made of three ſlips of very thin wood, and at the top a piece of iron ſtill thinner; that called the outer tympan is faſtened with hinges to the coffin; they are both covered with parchment; and between the two are placed blankets, which are neceſſary to take off the impreſſion of the letters upon the paper. The friſket *p* is a ſquare frame of thin iron, faſtened with hinges to the tympan; it is covered with paper cut in the neceſſary places, that the ſheet, which is put between the friſket and the great or outward tympan, may receive the ink, and that nothing may hurt the margins. To regulate the margins, a ſheet of paper is faſtened upon this tympan, which is called the tympan-ſheet, and on each ſide is fixed an iron-point, which makes two holes in the ſheet, which is to be placed on the ſame points, when the impreſſion is to be made on the other ſide. In preparing the preſs for working, the parchment which covers the outer tympan is wetted till it is very ſoft, in order to render the impreſſion more equable; the blankets are then put in, and ſecured from ſlipping by the inner tympan; then while one preſſman is beating the letter with the balls *q*, covered with ink taken from the ink-block; the other perſon places a ſheet of white paper on the tympan-ſheet, turns down the friſket upon it to keep the paper clean and prevent its ſlipping; then bringing the tympans upon the form, and turning the rounce, he brings the form with the ſtone, &c. weighing about 300 pounds weight, under the platten; pulls with the bar, by which means the platten preſſes the blankets and paper cloſe upon the letter, whereby half the form is printed; then eaſing the bar, he draws the form ſtill forward, gives a ſecond pull, and letting go the bar, turns back the form, takes up the tympans and friſket, takes off the printed ſheet and lays on a freſh one; and this is repeated till he has taken off the impreſſion upon the full number of ſheets the edition is to conſiſt of. One ſide of the ſheet being thus printed, the form for the other is laid upon the preſs, and worked off in the ſame manner.

Chineſe PRINTING is performed from wooden planks or blocks, cut like thoſe uſed in printing of callico, paper, cards, &c.

Rolling-Preſs-PRINTING is employed in taking off prints or impreſſions from copper-plates engraven, etched, or ſcraped as in mezzotintos.

This art is ſaid to have been as ancient as the year 1540, and to owe its origin to Finiguerra, a Florentine goldſmith, who pouring ſome melted brimſtone on an engraven plate, found the exact impreſſion of the engraving left in the cold brimſtone, marked with black taken out of the ſtrokes by the liquid ſulphur: upon this he attempted to do the ſame on ſilver plates with wet paper, by rolling it ſmoothly with a roller; and this ſucceeded: but this art was not uſed in England till the reign of king James I. when it was brought from Antwerp by Speed. The form of the rolling-preſs, the compoſition of the ink uſed therein, and the manner of applying both in taking off prints, are as follow.

The rolling-preſs A L (plate CIV. *fig.* 7.) may be divided into two parts, the body and carriage: the body conſiſts of two wooden cheeks, P, P, placed perpendicularly on a ſtand or foot L M, which ſuſtains the whole preſs. From the foot likewiſe ariſe four other perpendicular pieces *c*, *c*, *c*, *c*, joined by other croſs or horizontal ones, *d*, *d*, *d*, which ſerve to ſuſtain a ſmooth even plank or table H I K, about four feet and a half long, two feet and a half broad, and an inch and a half thick. Into the cheeks go two wooden cylinders or rollers, D E, F G, about ſix inches in diameter, borne up at each end by the cheeks, whoſe ends, which are leſſened to about two inches diameter, and called trunnions, turn in the cheeks between two pieces of wood in form of half moons, lined with poliſhed iron to facilitate the motion. Laſtly, to one of the trunnions of the upper roller is faſtened a croſs, conſiſting of two levers, A, B, or pieces of wood traverſing each other, the arms of which croſs ſerve inſtead of the bar or handle of the letter-preſs, by turning the upper roller, and when the plank is between the two rollers, giving the ſame motion to the under one, by drawing the plank forward and backward.

The ink uſed for copper-plates, is a compoſition made of the ſtones of peaches and apricots, the bones of ſheep, and ivory, all well burnt, and called Frankfort-black, mixt with nut oil that has been well boiled, and ground together on a marble, after the ſame manner painters do their colours.

The method of printing from copper-plates is as follows: they take a ſmall quantity of this ink on a rubber made of linen-rags, ſtrongly bound about each other, and therewith ſmear the whole face of the plate as it lies on a grate over a charcoal fire. The plate being ſufficiently inked, they firſt wipe it over with a foul rag, then with the palm of the left hand, and then with that of the right; and to dry the hand and forward the wiping, they rub it from time to time on whiting. In wiping the plate perfectly clean, yet without taking the ink out of the engraving, the addreſs of the workman conſiſts. The plate thus prepared is laid on the plank of the preſs; over the

plate is laid the paper, firſt well moiſtened, to receive the impreſſion, and over the paper two or three folds of flannel. Things thus diſpoſed, the arms of the croſs are pulled, and by that means, the plate with its furniture, paſſed through between the rollers, which pinching very ſtrongly, yet equally, preſſes the moiſtened paper into the ſtrokes of the engraving, whence it licks out the ink.

PRIOR, in general, ſomething before or nearer the beginning than another, to which it is compared.

PRIOR, more particularly, denotes the ſuperior of a convent of monks, or the next under the abbot.

Grand PRIOR is the ſuperior of a large abbey, where ſeveral ſuperiors are required.

PRISAGE, *Priſagium*, that part or ſhare which belongs to the king, or admiral, out of prizes taken at ſea from an enemy: this is uſually a tenth part. See the article PRIZE.

PRISCILLIANISTS, in church hiſtory, Chriſtian heretics, ſo called from their leader Priſcillian, a Spaniard by birth, and biſhop of Avila. He is ſaid to have practiſed magic, and to have maintained the principal errors of the Manichees; but this peculiar tenet was, that it is lawful to take falſe oaths, in order to ſupport one's cauſe and intereſt.

PRISM, *Priſma*, in geometry, an oblong ſolid contained under more than four planes, whoſe baſes are equal, parallel, and alike ſituated.

The word is Greek, ſignifying any thing ſawn, and derived from πριω, or πριζω, to ſaw.

The priſm is generated by the motion of a rectilinear figure, as A, B, C (plate CIV. *fig.* 8.) deſcending always parallel to itſelf, along the right line A E.

If the deſcribent be a triangle, the body is ſaid to be a triangular priſm; if ſquare, a quadrangular one, &c.

From the geneſis of the priſm, it is evident it has two equal and oppoſite baſes; and it is terminated by as many parallelograms as the baſe conſiſts of ſides; and that all the ſections of a priſm parallel to its baſe are equal.

Every triangular priſm may be divided into three equal pyramids.

PRISM, in dioptrics, a triangular glaſs-priſm, much uſed in experiments about the nature of light and colours.

PRISMOID, *Priſmoides*, in geometry, a ſolid figure, bounded by ſeveral planes, whoſe baſes are right-angled parallelograms, parallel, and alike ſituated.

PRISON, a goal, or place of confinement. See the article GOAL.

PRISONER, a perſon reſtrained or kept in priſon upon an action civil or criminal, or upon commandment: and one may be a priſoner on matter of record or matter of fact. A priſoner upon matter of record is he who being preſent in court, is by the court committed to priſon; and the other is one carried to priſon upon an arreſt, whether it be by the ſheriff, conſtable, or other officer.

PRIVATEERS, in maritime affairs, a kind of private ſhips of war, fitted out by private perſons at their own expence; who have leave granted them to keep what they can take from the enemy, allowing the admiral his ſhare.

PRIVATION, in general, denotes the abſence or want of ſomething; in which ſenſe, darkneſs is only a privation of light. See LIGHT.

PRIVATIVE, in grammar, a particle which, when prefixed to a word, changes it into a contrary ſenſe.

Among the Greeks the α is uſed as a privative, and among the Latins, *in*. The Engliſh, French, &c. borrow both the Greek and Latin privatives.

PRIVATIVE QUANTITY, or NEGATIVE QUANTITY, in algebra, denotes a quantity leſs than nothing, in oppoſition to affirmative or poſitive; and is expreſſed by the ſign (−) minus, prefixed thereto.

PRIVILEGE, in law, ſome peculiar benefit granted to certain perſons or places, contrary to the uſual courſe of the law.

Privileges are ſaid to be perſonal or real. Perſonal privileges are ſuch as are extended to peers, embaſſadors, members of parliament and of the convocation, and their menial ſervants, &c.

PRIVY, in law, denotes one who is partaker, or has an intereſt in an affair.

PRIZE, or PRISE, in maritime affairs, a veſſel taken at ſea from the enemies of a ſtate, or from pirates; and that either by a man of war, a privateer, &c. having a commiſſion for that purpoſe.

PROBABILITY is nothing but the appearance of the agreement or diſagreement of two ideas by the intervention of proofs whoſe connection is not conſtant and immutable, or is not perceived to be ſo; but is, or appears for the moſt part to be ſo, and is enough to induce the mind to judge the propoſition to be true or falſe, rather than the contrary.

Of probability there are degrees from the neighbourhood of certainty and demonſtration, quite down to improbability and unlikeneſs, even to the confines of impoſſibility; and alſo degrees of aſſent, from certain knowledge, and, what is next to it, full aſſurance and confidence, quite down to conjecture, doubt, diſtruſt, and diſbelief.

That propoſition then is probable for which there are arguments or proofs to make it paſs or be received for true. Probability being then to ſupply the defect of our knowledge, is always converſant about a thing whereof we have no certainty, but only ſome inducements to receive it for true. The grounds of it are, in ſhort, theſe two following:

Firſt, the conformity of any thing with our own knowledge, experience, or obſervation.

Secondly, the teſtimony of others vouching their obſervation and experience. In the teſtimony of others is to be conſidered, 1. the number; 2. the integrity; 3. the ſkill of the witneſſes; 4. the deſign of the author, if it be a teſtimony cited out of a book; 5. the conſiſtency of the parts and circumſtances of the relation; 6. contrary teſtimonies. The mind, before it rationally aſſents or diſſents to any probable propoſition, ought to examine all the grounds of probability, and ſee how they make more or leſs for or againſt it; and, upon a due ballancing the whole, reject or receive it, with a more or leſs firm aſſent, according to the preponderancy of the greater grounds of probability on one ſide or the other.

PROBABILITY, in poetry, the appearance of truth in the fable or action of a poem.

PROBATE of a will or teſtament, in law, is the exhibiting and proving of laſt wills and teſtaments before the eccleſiaſtical judge delegated by the biſhop who is ordinary at the place where the party died.

PROBATION, in the univerſities, is the examination and trial of a ſtudent who is about to take his degrees.

PROBATION, in a monaſtic ſenſe, ſignifies the year of novitiate which a religious moſt paſs in a convent, to prove his virtue and vocation, and whether he can bear the ſeverities of the rule.

PROBATIONER, in the church of Scotland, a ſtudent in divinity, who bringing a certificate from a profeſſor in an univerſity of his good morals, and his having performed his exerciſes to approbation, is admitted to undergo ſeveral trials.

PROBATOR, in law, one who undertakes to prove a crime charged upon another; properly, an accomplice in the crime who impeaches others.

PROBATUM EST, *it is proved*, a term frequently ſubjoined to a receipt for the cure of ſome diſeaſe.

PROBE, a ſurgeon's inſtrument for examining the circumſtances of wounds, ulcers, and other cavities, ſearching for ſtones in the bladder, &c.

PROBLEM, προβλημα, in logic, a propoſition that neither appears abſolutely true or falſe; and, conſequently, may be aſſerted either in the affirmative or negative.

PROBLEM, in geometry, is a propoſition, wherein ſome operation, or conſtruction is required; as to divide a line, or angle, erect or let fall perpendiculars, &c.

PROBLEM, in algebra, is a queſtion or propoſition which requires ſome unknown truth to be inveſtigated, and the truth of the diſcovery demonſtrated. So that a problem is to find a theorem.

Kepler's PROBLEM, in aſtronomy, is the determining a planet's

a planet's place from the time; ſo called from Kepler, who firſt propoſed it. It was this, to find the poſition of a right line, which, paſſing through one of the foci of an ellipſis, ſhall cut off an area deſcribed by its motion, which ſhall be in any given proportion to the whole area of the ellipſis. See ANOMALY.

Deliacal PROBLEM, or a problem for finding two mean proportionals between two given lines, in geometry, is the doubling of the cube; it was ſo called from the people of Delos, who, upon conſulting the oracle for a remedy againſt a plague, were anſwered, that the plague ſhould ceaſe when Apollo's altar, which was in form of a cube, ſhould be doubled. See the article DUPLICATION.

PROBLEMATICAL RESOLUTION, in algebra, a method of ſolving difficult queſtions by certain rules, called canons.

PROBOSCIS, in natural hiſtory, is the trunk or ſnout of an elephant, and ſome other animals and inſects.

PROCATARCTIC CAUSE, in medicine, the pre-exiſting, or pre-diſpoſing cauſe or occaſion of a diſeaſe. See DISEASE.

PROCEDURE, or PROCEEDINGS, in law, the courſe of the ſeveral acts, inſtructions, &c. of a proceſs or lawſuit.

It is either civil or criminal: civil procedure relates to the eſtate alone; criminal or extraordinary procedure, where the perſon is proſecuted.

PROCEED, among merchants, whatever ariſes from any thing.

PROCESS, in law, denotes the proceedings in any cauſe, real or perſonal, civil or criminal, from the original writ to the end thereof.

PROCESS, in chemiſtry, the whole courſe of an experiment or ſeries of operations, tending to produce ſomething new.

PROCESS, *Proceſſus*, in anatomy, denotes any protuberance or eminence in a bone.

PROCLAMATION, a public notice given of any thing of which the king thinks proper to advertiſe his ſubjects.

PROCONDYLUS, a name given to the firſt joint of each finger.

PROCONSUL, a Roman magiſtrate, ſent to govern a province with conſular authority.

PROCONSUL, in our ancient law books, is the ſame with juſtice in eyre. See JUSTICE.

PROCREATION, the begetting and bringing forth children. See GENERATION.

PROCTOR, a perſon commiſſioned to manage another perſon's cauſe in any court of the civil or eccleſiaſtical law.

PROCTORS, in an univerſity, are two officers choſen from among the ſtudents, to ſee good order and exerciſes daily performed.

PROCURATOR, a perſon who has a charge committed to him to act for another.

PROCYON, in aſtronomy, a fixed ſtar of the ſecond magnitude in the conſtellation called Canis Minor.

PRODUCING, in geometry, ſignifies the drawing out a line farther, till it have any aſſigned length.

PRODUCT, in arithmetic and geometry, the factum of two or more numbers, or lines, &c. into one another: thus $5 \times 4 = 20$, the product required.

PRODUCTION, in anatomy, the ſame with proceſs. See PROCESS.

PROEM, a term ſometimes uſed for prelude or preface.

PROEMPTOSIS, in aſtronomy, the appearance of the new moon a day later, by reaſon of the lunar equation. See MOON.

PROFESSOR, in the univerſities, a perſon who teaches or reads public lectures in ſome art or ſcience from a chair for the purpoſe.

PROFILE, in architecture, the draught of a building, fortification, &c. wherein are expreſſed the ſeveral heights, widths, and thickneſſes, ſuch as they would appear, were the building cut down perpendicularly from the roof to the foundation. It is alſo called ſection, or orthographical ſection, and by Vitruvius, ſciagraphy. This is the ſame as elevation, in oppoſition to a plan, which is called ichnography.

PROFILE alſo denotes the out-line of a figure, building, member of architecture, &c. Hence profiling ſometimes denotes deſigning or deſcribing the member with a rule, compaſs, &c.

PROFILE, in ſculpture and painting, denotes a head, portrait, &c. when repreſented ſidewiſe, or in a ſide-view. On almoſt all medals, faces are repreſented in profile.

PROGNOSTIC, προγνωσις, among phyſicians, ſignifies a judgment concerning the event of a diſeaſe, as whether it ſhall end in life or death, be ſhort or long, mild or malignant, &c.

PROGRAMMA, anciently, ſignified a letter, ſealed with the king's ſeal.

PROGRAMMA is alſo an univerſity term for a billet or advertiſement, poſted up, or given into the hand, by way of invitation to an oration, &c. containing the argument, or ſo much as is neceſſary for underſtanding thereof.

PROGRESSION, in general, denotes a regular advancing, or going forward, in the ſame courſe and manner.

PROGRESSION, in the mathematics, is either arithmetical or geometrical.

Arithmetical PROGRESSION is a ſeries of numbers or quantities increaſing or decreaſing by an equal interval, or common difference.

Theſe numbers or quantities are ſaid to be the moſt ſimple or natural progreſſion that begin their ſeries of increaſe or decreaſe with a cypher.

Thus, $\begin{cases} 0 : a : 2a : 3a : 4a : 5a : 6a : \&c. \text{ increaſing,} \\ 0 : -a : -2a : -3a : -4a : -5a : -6a : \&c. \text{ decreaſing} \end{cases}$

Or univerſally putting a for the firſt term in the progreſſion, and e for the common exceſs or difference.

Then, $\begin{cases} a : a+e : a+2e : a+3e : a+4e : a+5e : a+6e : \&c. \\ a : a-e : a-2e : a-3e : a-4e : a-5e : a-6e : \&c. \end{cases}$

In the firſt of theſe ſeries it is evident that, if there be but three terms, the ſum of the extremes will be double to the mean.

As in theſe, $0 : a : 2a$: Or, $a : 2a : 3a$: Or, $2a : 3a : 4a$: &c. viz. $2a + 0 = a + a$: Or, $a + 3a = 2a + 2a$, &c.

Alſo, in the ſecond ſeries increaſing or decreaſing, it is evident, that if the terms be $a : a + e : a + 2e$, &c. increaſing, then $a + a + 2e$, viz. $2a + 2e$, the ſum of the extremes, is double to $a + e$, the mean; or if they be $a : a - e : a - 2e$, &c. decreaſing; then $a + a - 2e$, viz. $2a - 2e$, the ſum of the extremes, is double to $a - e$, the mean. And ſo it will be in any three of the terms. Secondly, if there are four terms, then the ſum of the two extremes will be equal to the ſum of the two means. As in theſe, $a : a + e : a + 2e : a + 3e$, in the ſeries increaſing; here $a + a + 3e = a + e + a + 2e$. Alſo, in theſe, $a : a - e : a - 2e : a - 3e$, in the ſeries decreaſing; here $a + a - 3e = a - e + a - 2e$, &c. in any other four terms.

Conſequently, if there are never ſo many terms in the ſeries, the ſum of the two extremes will always be equal to the ſum of the two means that are equally diſtant from thoſe extremes.

As in theſe, $a : a + e : a + 2e : a + 3e : a + 4e : a + 5e$, &c.

Here $a + a + 5e = a + e + a + 4e = a + 2e + a + 3e$, &c.

And if the number of terms be odd, the ſum of the two extremes will be double the middle term, &c.

Whence it follows, that if the ſum of the two extremes be multiplied into the number of all the terms in the ſeries, that product will be double the ſum of all the ſeries.

And if the difference betwixt the two extremes be divided by the number of terms leſs 1, the quotient will be the common difference of the ſeries.

Geometrical PROGRESSION is a ſeries of numbers, or quantities, increaſing by one common multiplicator, or decreaſing by one common diviſor.

The moſt natural and ſimple ſeries of geometrical progreſſionals is when it begins with unity or 1.

As $1 . a . aa . aaa . aaaa . a^5 . a^6$. &c. in $\div$

For $1 : a :: a : aa :: aa : aaa :: aaa : aaaa$, &c.

Or $a . b . \frac{bb}{a} . \frac{bbb}{aa} . \frac{bbbb}{aaa} . \frac{b^5}{a^4}$. &c. are terms in $\div$

For $a : b :: b : \frac{bb}{a} :: \frac{bb}{a} : \frac{bbb}{aa} :: \frac{bbb}{aa} : \frac{b^4}{a^3} :: \frac{b^4}{a^3} : \frac{b^5}{a}$, &c.

That is, when all the middle terms betwixt the two extremes are both conſequents and antecedents, that ſeries is in geometrical progreſſion.

Therefore, in every ſeries of quantities in ÷, all the terms, except the laſt, are antecedents; and all the terms, except the firſt, are conſequents.

But univerſally putting a the firſt term in the ſeries, and e the ratio, viz. the common multiplier or diviſor, then there will be,

$a . ae . aee . aeee . aeeee . ae^5 . ae^6$. &c. in ÷

Or $a \frac{a}{e} . \frac{a}{ee} . \frac{a}{eee} . \frac{a}{eeee} . \frac{a}{e^5}$. &c. are in ÷

For $a : ae :: ae : \frac{aaee}{a} = aee$, &c.

And $a : \frac{a}{e} :: \frac{a}{e} : \frac{aa}{aee} = \frac{a}{ee} : \frac{a}{e} :: \frac{a}{ee} : \frac{a}{eee}$, &c.

In any of theſe ſeries it is evident, that if three quantities are in ÷, the rectangle of the two extremes will be equal to the ſquare of the mean. See PROPORTION.

PROHIBITED GOODS, in commerce, the ſame with contraband goods.

PROHIBITION, in law, is a writ that iſſues out of the chancery, King's Bench, or Common Pleas, to prohibit ſome other court, either ſpiritual or ſecular, to proceed in a cauſe there depending, upon a ſuggeſtion that the cauſe does not belong to the court.

PROJECTILE, or *Project*, in mechanics, any heavy body put into motion by an external force impreſſed thereon, and diſmiſſed from the agent, and left to purſue its courſe.

A projectile is any body A (plate CV. *fig.* 1.) thrown or projected in an upright, oblique, or horizontal direction; as a ſtone from the hand, an arrow from the bow, or a ball or bomb from a cannon or piece of ordnance. The force with which the body is projected, is called the impetus, and the diſtance to which it is thrown, is called the horizontal random, or amplitude of the projection.

Every projectile is acted upon by two forces or powers, viz. the impetus of the projectile force, and that of gravity. By the firſt, the body paſſes over equal ſpaces, A B, B C, C D, &c. in equal times; and, by the ſecond, it deſcends through the ſpaces A G, A H, A I, which are as the ſquares of the times; and, therefore, by theſe two forces compounded, the body will deſcribe, not a right line, but a curve A Q; and of that ſort which we call a parabola; and this will be the caſe in all directions but that in the perpendicular, when the path of the projectile will be (to appearance) a right line. The greater the angle of elevation K A M (*fig.* 2.) of the cannon is, the greater will be the height D B to which the projected body will riſe. Alſo the greater will be the diſtance or amplitude of the projection, till the ſaid angle becomes equal to 45 degrees K A O; upon which elevation, the random A Q will be the greateſt poſſible, and equal to twice the altitude A G of the perpendicular projection. On any elevation A M or A R, equally above or below 45 deg. as on 40 and 50, 30 and 60, 20 and 70 degrees, the random A C will be the ſame; which caſe an engineer frequently finds of great uſe.

If the object be ſituated above the horizon, then, in order to ſtrike it with the leaſt impetus, let a piece of looking-glaſs be fixed to the cannon perpendicular to its axis; and holding a plumb-line over the glaſs directly under the eye, the cannon is to be elevated till the object appears exactly under the plummet, and there fixed; if then it be diſcharged, it will ſtrike the object required.

From what has been ſaid, we may eaſily underſtand how a body projected upright, from the earth's ſurface, does really deſcribe a parabola, though, to appearance, it aſcends and deſcends in a right line. For it is urged by two forces, viz. the projectile upwards, and the force ariſing from the motion of the earth about its axis from weſt to eaſt; in which caſe it muſt neceſſarily deſcribe a parabola.

In the parabola it is demonſtrated, that the ſeveral abſciſſæ A G, A H, A I, &c. (*fig.* 1.) are as the ſquares of the ordinates G M, H N, I O, &c. and ſince this is the property of the curve which the projectile deſcribes, it is evident the projectile deſcribes a parabola.

Let A M (*fig.* 2.) repreſent the force with which a ball is projected from the cannon in the direction A M; this may be reſolved into two others A L and L M, of which the former is perpendicular, and the latter parallel to the horizon. The perpendicular force or velocity A L is that by which the ball riſes, and the heights to which it will riſe with the velocities A L and A M, are as the ſquares of the velocities, viz. as $\overline{AL}^2$ to $\overline{AM}^2$; but (becauſe A L : A M :: A M : A G) $\overline{AL}^2 : \overline{AM}^2 :: AL : AG$; therefore, ſince A G repreſents the height to which the ball will riſe with the velocity A M, A L will be the height to which it will riſe with the velocity A L, or in the proportion of the elevation A M; thus B D = A L.

The velocity of the projection L M (*fig.* 3.) in the horizontal direction is every way uniform, or carries the ball through equal ſpaces A R, R S, S T, T V, V W, in equal times. For, by the ſingle impetus of the powder, the ball deſcribes equal ſpaces A B, B C, C D, &c. in equal times in the direction A F, as has been ſhewn; therefore, by the ſimilarity of triangles A R, R S, S T, &c. will be as A B, B C, C D, &c. that is, the horizontal ſpaces paſſed over in the projection will, in equal times, be equal.

Now, ſince the perpendicular velocity is to the horizontal velocity, as A L to L M, (*fig.* 2.) and A L is the ſpace paſſed through by the former in half the time of the projection, L M would be the ſpace paſſed through in the horizontal direction in the ſame time, if the velocity L M were of the ſame ſort with A L, viz. uniformly retarded and accelerated; but ſince L M is not retarded, but uniform, it will carry the body through twice the ſpace L M in the ſame time; that is, through A D = L B = 2 L M.

And ſince the time of the aſcent from A to B is equal to the time of deſcent, the ball will paſs over D C = A D in the time of the deſcent from B to C; therefore, the horizontal ſpace A C, which the ball paſſes over during the whole time of the projection, is equal to 4 times L M, wherever the point M is taken in the circumference A O G.

Hence, when A O is the direction of the cannon (O being the middle point of the ſemi-circle) the line N O, which is the horizontal velocity, will be the greateſt poſſible (from the nature of the circle) and conſequently 4 N O = A Q, the greateſt poſſible horizontal random; which, therefore, is made of an angle O A K = 45 deg. For O A K = A O N = O A N, becauſe N O = A N; therefore, ſince A N O = 90°, A O N = O A N = O A K = 45°.

Hence, A N = F E (= N O = ¼ A Q) will be the height of the projection on the angle O A K = 45°. Whence A Q will be the parameter, or latus rectum of the parabola A F Q. If M O = O R, then will L M = T R, and, conſequently, the horizontal random on the elevation A M, and A R, will be equal, viz. A C; but the height of the projection on A R will be A T = S D. Whence the height S D is to the height D B (as R K to M K) as the tangent of the angle of elevation R A K to the tangent of the angle M A K. From what has been demonſtrated it is eaſy to underſtand, that an object ſituated on the horizon may be hit by a ball diſcharged in an elevation of 45° with a leſs charge of powder, than on any other angle of elevation.

The time of the projection A B C is equal to the time of the perpendicular aſcent and deſcent through L A or B D (becauſe the horizontal velocity does no way affect that in the perpendicular) but the time of aſcent and deſcent in A L is to that in A G, as $\sqrt{AL}$ to $\sqrt{AG}$; that is (ſince $AL : AG :: \overline{AM}^2 : \overline{AG}^2$) as A M to A G; that is (becauſe A G : A M :: A M : A L = M K) as M K to A M, or as the ſines of the angle of elevation to the radius A G.

Therefore, the times of two different projections A B C, A S C, will be as the chords A M and A R, or as the ſines of the angles of the elevation to the radius A G.

Suppoſe it required to know from what height a body ought to fall to acquire ſuch a velocity, that being reflected

flected in the direction AF, it ſhould deſcribe the given parabola AOQ.

In order to this we are to conſider, that (the equation being $xp = yy$) the velocity of a ball, ſhot from the cannon, commences in the direction of the axis AL (or abſciſs x) in the point A; but that in the direction AF, or of the ordinate y, is from firſt to laſt the ſame; conſequently there muſt be a certain point to which the ball having deſcended, acquires a velocity equal to that in the direction AF, which is uniform; and this muſt be when $\dot{x} = \dot{y}$, to determine which, putting the equation $xp = yy$ in fluxions, we have $\dot{x}p = 2y\dot{y}$; but ſince, in this caſe, we have $\dot{x} = \dot{y}$; therefore, $p = 2y$, and $\frac{p}{2} = y = \sqrt{xp}$ (per equation;) therefore, $\frac{1}{4}p^2 = xp$; that is, $\frac{1}{4}p = x$.

Conſequently, if an heavy body fall from the height of $\frac{1}{4}$ of the parameter of the given point A, and in that point it be reflected (with the velocity there acquired) in the direction AF, it will deſcribe the given parabola AOQ.

If it be required to ſtrike the point B (*fig.* 4.) whoſe diſtance AD and height BD are given, with the leaſt impetus of all that will hit it, then, in order to find the elevation of the cannon, draw AB and EA perpendicular to AC; on the point A deſcribe the arch *abc*; which biſect in *b*; then a line AF, drawn through that point, will be the elevation of the cannon, as required; and the leaſt impetus will be equal to $\frac{AB + BD}{2}$. See the demonſtration of this by the inventor, Dr. Halley, in the *Philoſophical Tranſactions*, and by Dr. Keill, *Introduct.* page 280, 281. From a bare view of the diagram, the reaſon of the uſe of the looking-glaſs and plummet mentioned before is evident.

If a ball be projected perpendicularly upright in the direction AF (*fig.* 5.) with a velocity that will carry it to the height of one mile, or 5280 feet; it will be 18 ſeconds (nearly) in the aſcent, and as much in the deſcent (for as 16,2 feet : 5280 feet :: $1^2 : x^2$; whence $x = 18''$ (nearly) the time of aſcent or deſcent) now, in the parallel of London, the motion of the earth's ſurface, and of all bodies upon it, is at the rate of 10,8 miles per minute, or 950 feet per ſecond, from weſt to eaſt; therefore, in 36 ſeconds, the time of the aſcent and deſcent, the ball will be carried over 34,214 feet, or more than 6 miles, in the horizontal direction eaſtwards, from the point A to H. Now, ſince the ball is carried at the ſame time with a retarded force upwards, and an uniform force forwards, it will deſcribe the parabola ADH. And becauſe the horizontal motion in the ſpectator and in the project is the ſame, they will be carried through equal ſpaces AN, OB; AM, PC; AL, FD, &c. in the ſame time; and, conſequently, the projected ball will always appear perpendicularly over the ſpectator in every point of the curve, which is the occaſion of the deception abovementioned.

Hence the objection uſually urged againſt the motion of the earth, from the apparent aſcent and deſcent of projectiles in a right line, is the reſult of ignorance; as, indeed, are all other arguments of this kind.

PROJECTILE. See the article RANGE.

PROJECTION, in mechanics, the act of giving a projectile its motion.

If the direction of the force, whereby the projectile is put in motion, be perpendicular to the horizon, the projection is ſaid to be perpendicular; if parallel to the apparent horizon, a horizontal projection: if it make an oblique angle, the projection is oblique.

The angle RAC (plate CV. *fig.* 2.) which the line of direction AR makes with the horizontal line AC, is called the angle of elevation of the projectile.

PROJECTION, in perſpective, denotes the appearance or repreſentation of an object on the perſpective plane.

The projection of a point A (plate XCIV. *fig.* 5.) is a point *a*, through which the optic ray OA paſſes from the objective point through the plane to the eye; or it is the point *a*, wherein the plane cuts the optic ray.

And hence is eaſily conceived what is meant by the projection of a line, a plane, or a ſolid.

PROJECTION *of the Sphere*, in plano, a repreſentation of the ſeveral points of the ſurface of the ſphere, and the circles deſcribed thereon, or any aſſigned parts thereof, ſuch as they appear to the eye ſituate at a given diſtance upon a tranſparent plane placed between the eye and the ſphere.

The projection of the ſphere is either orthographic, ſtereographic, or gnomonic.

Orthographic PROJECTION *of the Sphere*, is that wherein the circles of the ſphere are drawn on a plane, the eye being placed at an infinite diſtance, vertically to one of the hemiſpheres.

Let ABDE (plate CV. *fig.* 6.) be the primitive circle, or plane of the projection, which we may ſuppoſe to be meridian; and let AED be a great circle elevated above the plane in any angle BAE. Suppoſe this circle be projected on the plane into the curve AFD, by perpendiculars, paſſing through every point thereof; it is required to find the nature of the projected curve AFD.

In order to this, let EF and HG be two perpendiculars: draw GI parallel to CE, and HI parallel to CF, and G*g* to CI; and from *g* let fall the perpendicular *gh*; then is the right-angled triangle GHI equal and ſimilar to *ghC*, and *ghC* is ſimilar to EFC. Wherefore, putting $AC = EC = a$, $CI = x$, $GI = y$, $CF = b$, and $HI = y$; then, by the property of the circle, we have $AI \times ID = GI^2$; that is, $yy = aa - xx$, and $y = \sqrt{a^2 - x^2} = GI$; but $GI : HI :: (gC : hC ::) EC : FC$, that is, $y : y :: a : b$; therefore, $y = \frac{by}{a} = \frac{b}{a}\sqrt{a^2 - x^2}$; which ſhews the curve AFD to be an ellipſe, whoſe ſemi-axes are AC and CF.

Hence the circles of a ſphere viewed at an infinite diſtance are projected into ellipſes. Thus, the circle of illumination on the diſk of the moon is an ellipſe. Thus alſo, a ſphere ſet in the ſun-beams will have its circles all projected into elliptic ſhadows. And hence it is we conſtruct the orthographic projection, called the analemma. See MAP.

Now becauſe CE : CF :: radius : co-ſine of ECF, it appears that the ſemi-diameter CE of every circle is projected into the co-ſine FC of its elevation above the plane of projection. Hence alſo it appears, that in this projection the ſame number of degrees in a right circle, as BCE, will be projected into very different portions of the diameter of the plane BE. Thus 10 degrees from the pole of the primitive will be projected into the arch CK, but 10 degrees from the periphery will be projected into EM. But CK is to EM, as the right ſine of 10 degrees to the verſed ſine of the ſame; that is, as 1736 to 152, or nearly as 12 to 1. Hence the reaſon why the ſpots in the ſun appear to move ſo much faſter over the middle parts of the diſk than on the outſide, and why their motion is always unequal, with other phænomena of the like nature.

Stereographic PROJECTION *of the Sphere*, that on which our maps are commonly made, and depends on this principle, that if the plane of any meridian be ſuppoſed the plane of the projection, then an eye, placed in one pole of that meridian, will project all the circles in the oppoſite hemiſphere into circular arches on the ſaid plane. Thus, let AGDE (plate CV. *fig.* 7.) be any meridian; then the diameter AD, dividing it into the upper and nether hemiſpheres, is called the line of meaſures; and an eye, placed at the pole E, will project every point B, F, G, in the oppoſite ſemi-circle, into the points H, I, C, into the line of meaſures AD, by the viſual rays EB, EF, EG.

Hence, if the arch $AB = FG = 10$ degrees, then will their repreſentations in the line of meaſures be AK and IC; and the points H and I are thoſe through which the circles of 10 degrees and of 80 degrees do paſs in projection, viz. the circles GHE and GIE, as is evident from conſidering the figure. Hence the reaſon why the meridians do all lie nearer to each other in the middle parts of the map than on the outſides; and, conſequently, why the ſeveral parts of the earth cannot be duly repreſented on ſuch maps, either in reſpect of magnitude or poſition. See MAP.

On E, as a center, deſcribe the arch CM, and draw the

the line EK; the arch GK will be projected into the line CL, which is the tangent of the angle CEL. But the angle CEL is equal to half the angle GCK, or arch GK; therefore, any arch GK is projected into a line CL equal to the tangent of the angle CEL. But the angle CEL is equal to half the angle GCK, or arch GK; therefore, any arch GK is projected into a line CL equal to the tangent of half that arch. Hence the line CD is called the line of half-tangents, in reſpect of the quadrant GKD.

We ſhall here repreſent the caſes of theſe aſtronomical problems, as they are performable by the circles of the celeſtial globe, or by the ſtereographical projection of the ſphere in plano, thus: Let ÆNQS (*fig.* 8.) be the general meridian. NS the axis of the ſphere. ÆQ the equinoctial line. HO the horizon of London. ♋C ♑ the ecliptic or ſun's path. ZD the prime vertical, or azimuth. EP the axis of the ecliptic. NAS an hour circle or meridian. ZAD an azimuth circle. EYP a circle of longitude. ♋I ♋ the tropic of Cancer. ♑ ♑ the tropic of Capricorn.

By means of theſe circles, various ſpherical triangles are formed for calculation. Thus, let A be the place of the ſun in the ecliptic; then, in the right-angled triangle AXC, we have CA, the ſun's place, or longitude from the equinox C; AX, the ſun's declination north; CX, the ſun's right aſcenſion; ACX, the angle of obliquity of the ecliptic. And ſuppoſing the ſun riſing in the horizon at M on the day of the ſummer tropic, and NMS an hour circle, then there is formed the right-angled triangle NOM, in which we have NO = ÆZ = the latitude of the place Z; MO the amplitude from the north; NM the complement of the ſun's declination RM; ONM the angle of the hour from midnight; OMN the angle of the ſun's poſition. On the ſame tropical day the ſun is at I at ſix of the clock, becauſe the hour circle of ſix is projected upon the axis NCS; therefore, in the right-angled triangle ICK, we have IK the ſun's altitude at ſix. CK the azimuth from the eaſt at ſix; CI the declination north; ICK the latitude of the place. Again, when the ſun on the ſame day comes to the prime vertical ZCD, his place, when due eaſt and weſt, is at G; therefore, in the right-angled triangle GBC, we have GB the ſun's declination north; GC the ſun's altitude, when eaſt or weſt; BC the hour of his being due eaſt or weſt; BCG the latitude of the place.

Suppoſe the ſun in the horizon at M, once more; then in the right-angled triangle MCR, we have CM the amplitude from eaſt to weſt; MR the declination north; CR the aſcenſional difference; RCM the co-latitude of the plane; RMC the angle of poſition. In the oblique triangle AZN, we have ZN the co-latitude of the place Z; AN the co-declination; AZ the complement of the altitude AF; ANZ the hour from noon, equal to ÆX; AZN the azimuth from the north. And the ſame may be done for any ſtar at A, or any other place. Laſtly, let Y be any ſtar, then, in the oblique triangle YNE, we have YE the co-latitude of the ſtar, viz. YK; YE the co-declination of the ſtar; NE = Æ♋ = the obliquity of the ecliptic; NEY the ſtar's longitude in the ecliptic; ENY the hour for midnight.

Gnomonic PROJECTION *of the Sphere*, is the projection of the ſeveral circles of the ſphere, on a plane which touches the ſurface of the ſphere, the eye being placed in the center. See DIALLING.

PROJECTURE, in architecture, the out-jetting, prominency, or emboſſing, which the mouldings and other members have beyond the naked wall, column, &c. and is always in proportion to its height. The word is alſo applied to galleries, balconies, &c. which jet out beyond the face of the wall. Vitruvius gives it as a general rule, that all projecting members in building have their projectures equal to their height; but this is not to be underſtood of particular members, or mouldings, as dentils, coronas, the faſciæ of architraves, the abacus of the Tuſcan and Doric capital, &c. but only of the projectures of intire corniches. Some modern architects are of opinion that the great point in building conſiſts in knowing how to vary the proportions of projectures agreeably to the circumſtances of the building. Thus, they ſay, the nearneſs and remoteneſs, making a difference in the view, require different projectures; but it is plain, that the ancients had no ſuch intention. M. Perrault obſerves, that the projecture of the baſe and corniche is greater in the antique than the modern building by one third; which ſeems to follow in a good meaſure from the ancients proportioning the projecture to the height of the pedeſtal, whereas the moderns make the projecture the ſame in all the orders, though the height of the pedeſtal be very different.

PROLAPSUS, in ſurgery, a prolapſion, or falling out of any part of the body from its natural ſituation: thus we ſay, *prolapſus inteſtini*, a prolapſion of the inteſtine, &c.

PROLAPSUS ANI is ſuch a prolapſion of the inteſtinum rectum, that it is frequently inverted, or prolapſed to ſuch a degree both in adults and infants, as to appear near a handbreadth hanging out of its natural ſituation. Heiſter thinks, that the cauſe of this diſorder may be a great weakneſs or relaxation in the rectum, which frequently happens to croſs and clamorous children, or from a teneſmus, violent pains of the piles, a dyſentery, a ſtone, or ulcer in the bladder, a difficult expulſion of the birth, or the fæces, &c. The diſorder is not difficult to cure when recent and the patient not weak; but in the contrary circumſtances, to effect a perfect cure is next to impoſſible. If a gangrene or cancer ſhould infect the rectum, as in ſuch caſes it may, the abovementioned author adviſes the application of diſcutient and emollient remedies, and if they prove unſucceſsful, an extirpation of the morbid part. The reduction of the inteſtine, which ſhould be effected as ſoon as poſſible, is done and retained in the ſame manner as is directed in returning and retaining the prolapſed inteſtines in wounds of the abdomen. See ABDOMEN.

PROLAPSUS OCULI is a diſtemperature of the eye, in which it is ſo violently inflamed and ſwelled, that it cannot be contained in its orbit, but protrudes itſelf out of its natural ſeat. The cauſes of this diſorder are various, proceeding ſometimes from a violent inflammation, or a redundancy of humours in the eye, from an obſtruction of the reductory veſſels, and ſometimes from a ſchirrhus, cancer, or ſome external violence. When the diſorder is recent, and occaſioned by humours, they may be generally diſperſed, according to Heiſter, by bleeding, purging, and veſicatories, with internal attenuants and diluents, and external diſcutient fomentations. But if the caſe is too obſtinate to yield to remedies, recourſe muſt be had to the chirurgical operation of the paracenteſis, as in other dropſical caſes.

At every dreſſing a concave plate of lead muſt be firmly ſecured upon the eye, till it recover its natural figure. After the paracenteſis, which our author chooſes to do in the ſclerotica, rather than the cornea, he dips his compreſs in ſpirit of wine. When the eye is infected, even to the root, with a ſchirrhus or cancer, there is no ſafer method of relieving the patient, than by extirpating it clean out of the orbit, deterging and healing the wound. See the article WOUND.

PROLAPSUS INTESTINI, or a prolapſion of the inteſtine. See the articles ENTEROCELE and OSCHEOCELE.

PROLAPSUS OMENTI, or a falling of the omentum into the ſcrotum. See EPIPLOCELE.

PROLAPSUS UTERI is when the uterus falls down and appears out of the vagina; whereas when it only deſcends into the vagina, it is termed a deſcent, or bearing down of the womb. The apparent and moſt general cauſe of a prolapſus uteri is from too great a relaxation and weakneſs of its ligatures, and of the vagina, and is obſerved moſt frequently to follow a difficult labour, or other violent ſtraining, though it may ſometimes happen even to maids and young girls: as to the other ſpecies of this diſorder called the deſcent of the womb, wherein the prolapſed uterus is inverted like a bag, ſo that its internal ſurface appears outermoſt, which at the ſame time lies concealed in the vagina, it is never obſerved but when the uterus is forced down together with the ſecundines, or after a difficult labour; and if it is not ſpeedily reduced, the caſe ſoon becomes paſt cure, and kills the patient. In order to reduce the uterus, after the patient has diſcharged her urine, ſhe is to be placed in a proper poſture, and

5 JA 59

carefully ſeparating the placenta, if it adheres to the uterus, the latter is to be replaced with the fingers, by returning the pendulous part firſt with the three middle fingers, and then with the whole hand into the cavity of the abdomen. When the parts have recovered their former ſituation, the patient is to keep in bed, lying on her back, with her legs cloſe together; and reſting in this poſture is of itſelf very often ſufficient: however, it may not be improper to ſecure the womb from falling down again, either in coughing, ſneezing or otherwiſe, by retaining the lips of the pudenda together by a proper bandage. If there is an inflammation, bleeding and fomentation of the part with milk and water muſt be uſed. This diſorder is not ſo dangerous when the womb appears externally from a relaxation of its ligaments, but without inverſion, and not in the time of labour, as it is not likely to be attended with inflammation or mortification; but when it happens in a weak habit, it is often impracticable to ſuſtain it in its proper ſituation. In this caſe it muſt be aſſiſted by a proper bandage, and a retaining inſtrument internally, ſuch as a peſſary, or any other inſtrument for that purpoſe. See PESSARY.

PROLAPSUS VAGINÆ, or a bearing down of the vagina, is often confounded with the prolapſus uteri, inſomuch that they are often called by the ſame name; not being eaſily diſtinguiſhable from each other. Heiſter takes a prolapſus of the vagina to happen when that body appears either wholly or in part without the labia pudendi; and a total prolapſion ſhews itſelf without the relaxed labia, like a fleſhy ring, red or bloody, and ſwelled more or leſs, according to particular circumſtances. With regard to the treatment, when it is without inflammation, the prolapſed parts ſhould be returned without the leaſt delay, to prevent any inflammation, ſchirrhus, or gangrene, after being fomented with ſome aſtringent and diſcutient liquor; after which the patient ſhould keep her bed for ſeveral days, retaining her thighs cloſe together, without moving her body. In ſome caſes it will be proper to heat the patient with ſome mineral waters of the chalybeat kind, and ſome preparations of ſteel; but if the diſorder is inveterate, endeavours muſt be uſed to palliate it, by ordering the patient conſtantly to wear the T bandage. See BANDAGE.

If the prolapſed parts are inflamed, diſcutient ſomentations and cataplaſms are to be applied externally, and bleeding and the other internal medicines directed under the article INFLAMMATION.

PROLAPSUS UVULÆ, a diſorder of the uvula, which is ſometimes ſo much enlarged and elongated as even to reach the larynx and pharynx, and obſtruct the actions both of reſpiration and deglutition. If it proceeds from a recent inflammation, as may be judged from the pain, heat, and redneſs of the circumjacent parts, the patient may be relieved with cooling gargles, and injections of wine and water, or a decoction of proper herbs with a little alum; but at the ſame time proper coolers muſt be uſed internally, with bleeding, purges, and clyſters, to prevent the inflammation from ſpreading through the fauces, and exciting a quinſy. When this diſorder continues, notwithſtanding the uſe of remedies, it will be neceſſary, depreſſing the tongue with a ſpatula, to clip off the redundant part of the uvula with a pair of ſciſſars; after which the blood being permitted to run a little time, it may be reſtrained by a gargle of warm wine, vinegar, or if it ſtill continues, apply a little alum, or a cautery, till the hæmorrhage ceaſes.

PROLATE, in geometry, an epithet applied to a ſpheroid produced by the revolution of a ſemi-ellipſis about its larger diameter.

PROLATION, in muſic, the art of ſhaking or making ſeveral inflections of the voice or ſound on the ſame note or ſyllable.

PROLEGOMENA, in philology, certain preparatory obſervations or diſcourſes prefixed to a book, &c. containing ſomething neceſſary for the reader to be appriſed of, to enable him the better to underſtand the book, or to enter deeper into the ſcience, &c.

PROLEPSIS, προλη‡ις, a figure in rhetoric, by which we anticipate or prevent what might be objected by the adverſary; thus, *it may be objected*, &c.

PROLEPTIC, προλεπ‡ικ⊙, an epithet applied to a periodical diſeaſe which anticipates, or whoſe paroxyſm returns ſooner and ſooner every time, as is frequently the caſe in agues.

PROLOCUTOR *of the Convocation*, the ſpeaker or chairman of that aſſembly.

PROLOGUE, *Prologus*, in dramatic poetry, a diſcourſe addreſſed to the audience before the drama or play begins. The original intention was to advertiſe the audience of the ſubject of the piece, and to prepare them to enter more eaſily into the action, and ſometimes to make an apology for the poet. The laſt article ſeems intirely to have taken poſſeſſion of the prologue in the Britiſh drama. The French have left off the uſe of prologues: thoſe few they uſe have nothing in them of the genuine prologue, as bearing no relation to the ſubject, but being mere flouriſhes or harangues in praiſe of the king, &c. In the ancient theatre the prologus was properly the actor who rehearſed the prologue: the prologus was eſteemed one of the dramatis perſonæ, and never appeared in the piece in any other character: the prologue, therefore, among them, though not an eſſential, was yet an acceſſary part of the piece; with us it is no part at all, but ſomething intirely diſtinct and ſeparate: with them the drama was opened with the appearance of the prologus; with us it is not opened till after the prologus is retired. With us he always directs his ſpeech to the audience, conſidered as in a play-houſe; but with them he ought in propriety to have ſpoken to a chorus of byſtanders, or perſons to be preſent at the real action: but this being in a great meaſure inconſiſtent with the deſign of a prologue, it was directed to the audience. The prologue is of much more ancient ſtanding than the epilogue. See the article EPILOGUE.

PROMETHEUS, in the ancient aſtronomy, the name of the conſtellation now called Hercules. See HERCULES.

PROMISE, in law, is when upon any valuable conſideration one binds himſelf by word of mouth to another to perform a thing agreed on. It is held upon ſuch a promiſe that action will lie for breach, which will not if the promiſe be without conſideration, that being a naked bargain, from which no action can ariſe.

PROMONTORY, in geography, a high point of land or rock projecting out into the ſea; the extremity of which towards the ſea, is called a cape, or headland.

PROMPTER, in the drama, an officer whoſe buſineſs it is to watch attentively the actors ſpeaking on the ſtage, in order to ſuggeſt and put them forward, when at a ſtand, to correct them when amiſs, &c. in their parts.

PROMULGATED, or PROMULGED, ſomething publiſhed or proclaimed, and generally applied to a law, to denote the publiſhing or proclaiming it to the people.

PRONAOS, in the ancient architecture, a porch to a church, palace, or other ſpacious building. See the article PORCH.

PRONATORS, *Pronatores*, in anatomy, two muſcles of the radius, which ſerve to turn the palm of the hand downwards, and are diſtinguiſhed by the names of rotundus and quadratus. The pronator quadratus, or tranſverſus, is a ſmall fleſhy muſcle, lying tranſverſely on the inſide of the lower extremity of the fore arm. It is fixed by one ſide in the long eminence at the lower part of the internal angle of the ulna, and by the other in the concave ſide of the lower extremity of the radius. It is nearly as broad as it is long, and is wholly fleſhy, without any mixture of tendinous fibres. The pronator rotundus, or obliquus, is a ſmall muſcle more broad than thick, ſituated on the upper part of the ulna, oppoſite to the ſupinator brevis. It is fixed to the internal condyle of the os humeri, and from thence paſſes obliquely before the extremity of the tendon of the brachiæus, and reaches to the middle part of the convex ſide of the radius, where it becomes flat, and is inſerted below the ſupinator brevis, by an extremity almoſt altogether fleſhy.

PRONG-HOE, in huſbandry, the name of an inſtrument uſed to hoe or break the ground near and among the roots of plants. The prong-hoe conſiſts of two hooked points, of ſix or ſeven inches length; and when ſtruck into the ground, will ſtir and remove it the ſame depth

as the plough does; and thus anſwer both the ends of cutting up the weeds, and opening the land. The prong-hoe comes into excellent uſe, even in the horſe-hoeing huſbandry; and in this the hoe-plough can only come within three or four inches of the rows of the corn, turneps, and the like; but this inſtrument may be uſed afterwards; and with it the land may be raiſed and ſtirred, even to the very ſtalk of the plant.

PRONOUN, *Pronomen*, in grammar, a declinable part of ſpeech, which being put inſtead of a noun, points out ſome perſon, or thing.

Pronouns are divided into the ſix following claſſes, viz. demonſtrative pronouns; relative pronouns; poſſeſſive pronouns; gentile pronouns, or ſuch as denote a perſon's country, as *noſtras*, *veſtras*, and *cujas*; interrogative pronouns, and reciprocal pronouns. See DEMONSTRATIVE, RELATIVE, &c.

PRONOUNCING, or PRONUNCIATION, in painting, the marking and expreſſing the parts of all kinds of bodies with that degree of force, neceſſary to make them more or leſs diſtinct and conſpicuous.

PRONUNCIATION, *Pronunciatio*, in grammar, the manner of articulating or ſounding the words of a language.

Pronunciation makes much the moſt difficult part of a written grammar; in regard that a book expreſſing itſelf to the eyes, in a matter that wholly concerns the ears, ſeems next akin to that of teaching the blind to diſtinguiſh colours: hence it is that there is no part ſo defective in grammar as that of the pronunciation, as the writer has frequently no term whereby to give the reader an idea of the ſound he would expreſs; for want of a proper term, therefore, he ſubſtitutes a vicious and precarious one. To give a juſt idea of the pronunciation of a language, it ſeems neceſſary to fix as nearly as poſſible all the ſeveral ſounds employed in the pronunciation of that language. Cicero tells us, that pronunciation underwent ſeveral changes among the Romans; and indeed it is more precarious in the living languages, being, as Du Bos tells us, ſubſervient to faſhion in theſe. The French language is clogged with a difficulty in pronunciation from which moſt others are free; and it conſiſts in this, that moſt of their words have two different pronunciations, the one in common proſe, the other in verſe.

PRONUNCIATION is alſo uſed for the fifth and laſt part of rhetoric, which conſiſts in varying and regulating the voice agreeably to the matter and words, ſo as moſt effectually to perſuade and touch the hearers. It is much the ſame with what is otherwiſe called emphaſis.

PROOF, in arithmetic, an operation whereby the truth and juſtneſs of a calculation is examined and aſcertained. The proper proof is always by the contrary rule: thus ſubtraction is the proof of addition, and multiplication of diviſion; and *vice verſa*.

PROOF, in law, &c. denotes the mediums or arguments uſed to evince the truth of any thing.

PROOF is alſo uſed in a ſynonymous ſenſe with ſtandard; thus we call that proof ſpirit, which is of the ſtandard ſtrength, or half alcohol half phlegm.

PROPAGATION, *Propagatio*, the act of multiplying the kind, or of producing the like in the natural way of generation.

PROPER, *Proprium*, ſomething naturally and eſſentially belonging to any thing.

PROPER, in grammar, is applied to nouns, or names, which are diſtinguiſhed into proper and appellative.

PROPER FRACTION. See the article FRACTION.

PROPERTY, *Proprietas*, in a general ſenſe, that which conſtitutes or denominates a thing proper; or it is a particular virtue or quality which nature has beſtowed on ſome things excluſive of all others: thus colour is a property of light; extenſion, figure, diviſibility, and impenetrability, are properties of body, &c.

PROPERTY, in law, is defined to be the higheſt right a perſon has, or can have, to any thing; it being uſed to denote that right which one has to lands or tenements, goods or chattels, in no reſpect depending upon another's courteſy.

PROPHECY, προφητεια, a prediction made by divine inſpiration.

Mr. Whiſton condemns all allegorical explanations of the prophecies of the Old Teſtament cited in the New, as weak, enthuſiaſtic, &c. and adds, that if a double ſenſe of the prophecies be allowed, and there be no other method of ſhewing their completion than by applying them ſecondarily and typically to our Lord, after having been in their firſt and primary intention long ago fulfilled in the times of the Old Teſtament, we loſe all the real advantages of the ancient prophecies as to the proof of chriſtianity. He therefore ſets up a new ſcheme in oppoſition thereto: he owns that taking the preſent text of the Old Teſtament for genuine, it is impoſſible to expound the apoſtles citations of the prophecies of the Old Teſtament on any other than the allegorical foundation; and therefore, to ſolve the difficulty, he is forced to have recourſe to a ſuppoſition contrary to the ſenſe of all Chriſtian writers before him, viz. that the text of the Old Teſtament has been greatly corrupted ſince the apoſtolical age by the Jews.

Perſons pretending to prophecies are puniſhable at common law; by ſtatute, likewiſe, if any perſon publiſh ſuch prophecies with an intent to raiſe ſedition, they ſhall forfeit 10 l. for the firſt offence, and ſuffer a year's impriſonment; and for the ſecond, incur the forfeiture of all their goods, &c.

PROPHET, προφητης, in general, a perſon who foretels future events, but is particularly applied to ſuch inſpired perſons among the Jews as were commiſſioned by God to declare his will and purpoſes to that people. Among the canonical books of the Old Teſtament, we have the writings of ſixteen prophets, four of which are denominated the greater prophets, viz. Iſaiah, Jeremiah, Ezekiel, and Daniel, ſo called from the length or extent of their writings, which exceed thoſe of the others, viz. Hoſea, Joel, Amos, Obadiah, Jonas, Micah, Nahum, Habakkuk, Haggai, Zachariah, and Malachi, who are called the leſſer prophets from the ſhortneſs of their writings. The Jews do not place Daniel among the prophets, becauſe, they ſay, he lived the life of a courtier rather than that of a prophet. An account of the ſeveral writings of the prophets may be ſeen each under its particular head.

PROPHYLACTICE, προφυλακτικη, in medicine, that part thereof which inſtructs as to the method of preſerving health and averting diſeaſes.

PROPITIATION, in theology, a ſacrifice offered to God to aſſwage his wrath, and render him propitious. Among the Jews there were both ordinary and public ſacrifices, as holocauſts, &c. offered by way of thankſgiving; and extraordinary ones, offered by particular perſons guilty of any crime, by way of propitiation. The Romiſh church believe the maſs to be a ſacrifice of propitiation for the living and the dead. The reformed churches allow of no propitiation but that one offered by Jeſus Chriſt on the croſs. Propitiation was alſo a feaſt among the Jews, celebrated on the tenth of the month Tiſri, in commemoration of the pardon proclaimed to their forefathers by Moſes on the part of God, who thereby remitted the puniſhment due to the crime of their worſhipping the golden calf.

PROPITIATORY, or MERCY-SEAT, among the Jews, was the cover or lid of the ark of the covenant. See ARK.

The cherubims ſpread their wings over the propitiatory.

PROPLASM is ſometimes uſed for a mould, where any metal or ſoft matter, which will afterwards grow hard, is caſt: hence,

PROPLASTICE, the art of making moulds for caſting things in.

PROPOLIS, the name of a certain ſubſtance more glutinous and tenacious than wax, with which the bees ſtop up all the holes or cracks in the ſides of their hives.

PROPORTION, in arithmetic, the identity or ſimilitude of two ratios, magnitudes or quantities, A, B, C, D, are ſaid to be proportional, the firſt A to the ſecond B, and the third C to the fourth D, when the ratio of the firſt A to the ſecond B is the ſame thing with the ratio of the third C to the fourth D; or which is the ſame thing, when the firſt A as often contains or is contained in the ſecond B, as the third C contains or is contained in

in the fourth D. Thus the numbers, 4, 8, 12, 24, are proportional numbers, becauſe the firſt number 4 is as often contained in the ſecond number 8, as the third number 12 is contained in the fourth number 24, that is, twice; and which is therefore called the common ratio.

Whence it follows, that magnitudes, which to one and the ſame magnitude have the ſame ratio, are equal the one to the other, and, if a magnitude have the ſame ratio to other magnitudes, thoſe magnitudes are equal one to the other. Which is the ninth prop. of Euc. v.

Now, in the comparing the quantities A B C D together, if the ratio of the ſecond B to the third C is found to be the ſame with the ratio of the firſt A to the ſecond B, and of the third C to the fourth D; then theſe four quantities A, B, C, D, are ſaid to be in geometric proportion continued, or ſometimes in geometric progreſſion, and are therefore called progreſſional numbers; and ſo for any greater number, viz. 5, 6, 7, &c. Thus, the numbers $\frac{1}{4}$, $\frac{1}{2}$, 1, 2, 4, 8, 16, 32, &c. or, 81, 27, 9, 3, 1, $\frac{1}{3}$, $\frac{1}{9}$, &c. are in geometric proportion continued, becauſe there is the ſame conſtant ratio between them, and are therefore called progreſſional numbers, or geometrical ſeries; the firſt of which is called an increaſing ſeries, becauſe it is generated by a continual multiplication; the ſecond is called a decreaſing ſeries, inaſmuch as it is generated by continual diviſion.

When 3, 4, or more quantities, A, B, C, D, &c. are continually proportional, the firſt A ſhall have a duplicate ratio to the third, C, of that it has to the ſecond B, as being compounded of the ratios of the firſt to the ſecond, of the ſecond to the third, and of the third to the fourth; ſo always in order one more, as the proportion ſhall be expreſſed.

In comparing the quantities A, B, C, D, together, if the ratio of the ſecond quantity B to the third C be greater or leſſer than the ratio of the firſt A to the ſecond B, or of the third C to the fourth D; then thoſe quantities A, B, C, D, are ſaid to be in geometric proportion diſcontinued; thus in the numbers, 4, 8, 24, 48, becauſe the ratio of the ſecond 8 to the third 24 is triple greater than the ratio of the firſt 4 to the ſecond 8, or of the third 24 to the fourth 48, which is but double, therefore, thoſe 4 numbers are in geometric proportion diſcontinued, and the ſign for diſcontinued proportion is :: and, where the ſign is placed, it ſhews that there the proportion is interrupted, and begins a-new, and accordingly, where four quantities are thus expreſſed A : B :: C : D, they are thus to be read, as A is to B, that is, in proportion to B, ſo is C to D.

From theſe premiſſes duly conſidered, all the various properties of proportional numbers or quantities will be eaſily inveſtigated.

Firſt, If four quantities be in proportion either continued or diſcontinued, the product of the extremes is equal to the product of the means.

Thus, if in diſcontinued proportion it be $ra : a :: rb : b$, the product of the extremes is $r \times a \times b = rab$, evidently equal to that of the means, $a \times r \times b = arb$.

Again, if in continued proportionals it be $a : ar :: arr : arrr$, the product of the extremes is $a \times arrr = aarrr$, evidently equal to the product of the means $ar \times arr = aarrr$. Whence, on the contrary,

If, of four quantities, the product of the means is equal to the product of the extremes, then theſe four quantities are all in geometric proportion.

If three quantities are in geometrical proportion continued, the product of the extremes is equal to the ſquare of the mean or middle term. Thus, if three terms be a, ar, arr, the product of the extremes is $a \times arr = aarr$, evidently equal to the ſquare of the mean or middle term $ar \times ar = aarr$.

If there be never ſo many continual proportionals, the product of the extremes is equal to the product of any two of the means, equally diſtant from the extremes; as alſo to the ſquare of the middle term, if the number of terms be odd. As in the ſeries a, ar, arr, ar^3, ar^4, ar^5, ar^6, &c. the product of the extremes, and of any two terms equally remote from them, and the ſquare of the middle term is $= aar^6$, as is manifeſt from multiplying them together.

If ſeveral quantities are proportionals continued, or diſcontinued, as one antecedent is to its conſequent, ſo is the ſum of all the antecedents to the ſum of all the conſequents.

If they are diſcontinued, as $a : ar :: b : br :: c : cr$; then, as $a : ar :: a + b + c : ar + br + cr$; for $\overline{a+b+c} \times ar = ar \times \overline{br + cr} \times a = aar + abr + acr$ evidently equal.

If they are continued, as a, ar, ar^2, ar^3, ar^4, ar^5, &c. then I ſay as $a : ar :: a + ar, + ar^2 + ar^3 + ar^4$, &c. : $ar + ar^2 + ar^3 + ar^4 + ar^5$, &c. For $a \times ar + ar^2$, $+ ar^3 + ar^4 + ar^5$, $= ar \times a + ar$, $+ ar^2$, $+ ar^3$, $+ ar^4$, $= aar + aar^2$, $+ aar^3$, $+ aar^4$, $+ aar^5$, evidently equal.

Hence we may eaſily find the ſum of any geometric progreſſion.

For ſuppoſe G the greateſt term, L the leaſt, and the proportion of the greateſt to the next leſſer, as R to 1. Suppoſe the ſum of the whole progreſſion S: now ſince the antecedent is to the conſequent as R to 1; and the ſum of all the antecedents is S − L, and the ſum of all the conſequents S − G; it will be R : 1 :: S − L : S − G; and therefore by the firſt, RS − RG = S − L; and taking away S on both ſides, and adding RG, we ſhall have RS − S = RG − L; and dividing both ſides of the equation by R − 1, we ſhall have $S = \frac{RG - L}{R - 1}$.

Example. Suppoſe 64, 32, 16, 8, 4, 2, 1, $\frac{1}{2}$, $\frac{1}{4}$, and it be required to find its ſum.

Here R = 2, G = 64, L $\frac{1}{4}$, and conſequently $R \times G - L = 127\frac{1}{4}$, and ſince $R - 1 = 1$, therefore the ſum is $127\frac{1}{4}$. By this theorem may the ſum of any infinite progreſſion decreaſing be found. For here L the leaſt term, being leſs than any aſſignable quantity, may be rejected as nothing; from this caſe it really vaniſhes, and then the theorem will be $S = \frac{R \times G}{R - 1}$.

Example. Suppoſe this decreaſing ſeries $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, $\frac{1}{32}$, $\frac{1}{64}$, $\frac{1}{128}$, &c. infinitely continued, the whole ſum will be 1, or unity for $R \times G = \frac{1}{2} = 1$, which, divided by $R - 1 = 1$, makes 1, = ſum. Again,

Suppoſe this ſeries $\frac{1}{3}$, $\frac{1}{9}$, $\frac{1}{27}$, $\frac{1}{81}$, &c. infinitely continued, the ſum will be $\frac{1}{2}$; for R is 3, and G $\frac{1}{3}$, and therefore $R \times G = 3 \times \frac{1}{3} = 1$, which, divided by $R - 1 = 2$, makes $\frac{1}{2}$ for the ſum; and univerſally let any quantity be propoſed, if I take a part thereof denominated by a, viz. $\frac{1}{a}$, and of this a part denominated by a, and ſo on infinitely, whatever be the number a, the whole progreſſion will be a part denominated by $a - 1$, that is, $\frac{1}{a}$ $\frac{1}{aa}$ $\frac{1}{aaa}$ $\frac{1}{a^4}$, &c. infinitely continued $= \frac{1}{a - 1}$.

If there be two ranks of quantities in geometrical proportion, their products and quotients ſhall likewiſe be proportional thus:

Suppoſe $a : ar :: b : br$

And $c : cs :: d : ds$.

Their products $ac : acrs :: bd : bdrs$; and quotes $\frac{a}{c} : \frac{ar}{cs} :: \frac{b}{d} : \frac{br}{ds}$ are evidently proportional; for firſt the product of the extremes $acbdrs$ is equal to the product of the means $acrsbd$; and, in the ſecond, the product of the extremes $\frac{abr}{cds}$ is = to the product of the means $\frac{arb}{csd}$.

If four quantities are proportional, either continually or diſcretely, the product of the extremes is equal to the product of the means.

For if a, ra, rra, $rrra$, ∴, or 2. 4. 8. 16. ∴, it is plain the product of the extremes and of the means is the ſame quantity $rrraa$ or 32.

In diſcrete proportionals, let $a : ra :: b : rb$; that is, 2 : 4 :: 15 : 30. The product of the extremes and of the means can here be no other than $rab = 60$.

On which proportion is grounded the golden rule, or Rule of Three in arithmetic; ſo called, becauſe having three numbers

numbers (as 2. 4. 15.) it teaches how to find an unknown fourth proportional: for, although this fourth be unknown, yet its product by 2 the firſt term is known, becauſe it is the ſame with the product of the means 4 and 15. Wherefore the rule directs us to multiply the third by the ſecond, that you may thereby obtain the product of the means; which, divided by one of the extremes, viz. the firſt, muſt needs give the other, that is, the fourth ſought. See RULE *of Three direct*.

Inverſe, or *Reciprocal* PROPORTION, is when, of four numbers or quantities, the third bears the ſame proportion to the firſt, as the ſecond does to the fourth. See RULE *of Three inverſe*.

Harmonical PROPORTION is when four numbers or quantities are taken in a certain order, the firſt having the ſame ratio to the fourth, as the difference of the firſt and ſecond has to the difference of the third and fourth. Example, 9, 12, 16, 24, are harmonically proportional, viz. 9 : 24 :: 12−9 : 24−16 (or 9 : 24 :: 3 : 8) but if the firſt is to the fourth, as the difference of the firſt and ſecond, it is called contra-harmonical proportion; as 2, 8, 4, 6, where 2 : 6 :: 6−4 : 8−2 (i. e. 2 : 6 :: 2 : 6.)

This kind of proportion may exiſt alſo between three numbers, one of which is compared as a middle term to both the extremes; that is, if the firſt has the ſame ratio to the third, as the difference of the firſt and ſecond to the difference of the ſecond and third; or as the difference of the ſecond and third to that of the firſt and ſecond; for ſuch coincide with the former, by taking the middle term twice. Example, 3. 4. 6, are harmonical, becauſe 3 : 6 :: 4−3 : 6−4 (viz. 3 : 6 :: 1 : 2) and theſe contra-harmonical, 3, 5, 6; becauſe 3 : 6 :: 6−5 : 5−3 (viz. 3 : 6 :: 1 : 2.) And if in a ſeries of numbers every 3 terms are harmonical, it is a harmonical ſeries or progreſſion (i. e. a ſeries of conjunct or continued harmonials.) Example, 10. 12. 15. 20. 30. 60. wherein every 3 terms next together are harmonical. And when of 4 terms the 2 middle are different, that may be called disjunct harmonical proportion.

But this conſiderable difference is to be obſerved between this kind of proportion and the former, that in a ſeries of continued harmonials every four terms adjacent will not alſo be harmonical, as they are geometrical or arithmetical in theſe kinds of progreſſion. Example. Though 10, 12, 15, are harmonical, and alſo 12, 15, 20; yet 10, 12, 15, 20, are not ſo.

If we take the word proportion ſtrictly, according to the general definition, for an equality of ſimilar relations between two numbers, then it muſt be owned there is no new ſpecies of proportion here; for there is no new kind of relation in any two terms, but only a mixed compariſon between two numbers and their differences from others; and the proportion conſtituted is really a geometrical one, or an equality of ratios; not, indeed, of the given numbers, but of the ratio of the extremes compared to the ratio of the differences of theſe extremes with the middle terms: but though this is not ſtrictly a proportion among the given numbers immediately together, yet it is certainly a complex and new relation (diſtant from the immediate arithmetical or geometrical relation between the ſeveral couplets or numbers themſelves) to which, alſo, the name proportion is applied.

This denomination of harmonical ariſes from muſic; becauſe the relations or proportions of ſounds that make harmony, are found to be of the kind here defined, of which a more particular explanation may be ſeen under the article CONCORD.

PROPORTION is alſo uſed for the relation between unequal things of the ſame kind, whereby their ſeveral parts correſpond to each other with an equal augmentation or diminution.

Thus, in reducing a figure into little, or enlarging it, care is taken to obſerve an equal diminution, or enlargement, through all its parts; ſo that if one line, e. gr. be contracted by one-third of its length, all the reſt ſhall be contracted in the ſame proportion.

The making reductions of this kind is the great uſe of the proportional compaſſes.

PROPOSITION, *Propoſitio*, in logic, part of an argument wherein ſome quality, either negative or poſitive, is attributed to a ſubject; or, according to Chauvinus, it is a complete conſiſtent ſentence, indicating or expreſſing ſomething either true or falſe, without ambiguity, as, God is juſt.

PROPOSITION, in mathematics, is either ſome truth advanced and ſhewn to be ſuch by demonſtration, or ſome operation propoſed, and its ſolution ſhewn. If the propoſition be deduced from ſeveral theoretical definitions compared together, it is called a theorem; if from a praxis, or ſeries of operations, it is called a problem.

PROPOSITION, in poetry, the firſt part of a poem, wherein the author propoſes briefly, and in general, what he is to ſay in the body of his work. It ſhould comprehend only the matter of the poem, that is, the action and the perſons that act. Horace preſcribes modeſty and ſimplicity in the propoſition, and would not have the poet promiſe too much, nor raiſe in the reader too great ideas of what he is going to relate.

PROPREFECT, *Propræfectus*, among the Romans, the prefect's lieutenant, or an officer whom the prefect of the pretorium commiſſioned to do any part of his duty in his place.

PROPRETOR, a Roman magiſtrate, who, having diſcharged the office of pretor at home, was ſent into a province to command there with his former pretorial authority. It was alſo an appellation given to thoſe who, without having been pretors at Rome, were ſent extraordinarily into the provinces to adminiſter juſtice with the authority of pretors.

PROPRIETOR, or PROPRIETARY, he who has the property of any thing.

PROPRIETY, in grammar, is where the direct and immediate ſignification of a word agrees to the thing it is applied to; in which ſenſe it is uſed in oppoſition to figurative, or remote ſignification.

PROQUESTOR, *Proquæſtor*, the queſtor's lieutenant, or a perſon who diſcharged the office of queſtor in his ſtead.

PRO RATA, in commerce, a term ſometimes uſed by merchants for, in proportion; as, "Each perſon muſt reap the profit or ſuſtain the loſs pro rata to his intereſt, that is, in proportion to his ſtock."

PROROGATION, *Prorogatio*, the act of prolonging, adjourning, or putting off to another time. The difference between a prorogation and an adjournment of parliament is, that by prorogation the ſeſſion is ended, and ſuch bills as paſſed in either houſe, or both houſes, and had not the royal aſſent, muſt, at the next aſſembly, begin again; becauſe that every ſeſſion of parliament is in law a ſeveral parliament: whereas, if the parliament be only adjourned, there is no new ſeſſion, and conſequently all things continue in the ſame ſtate they were in before the adjournment. See ADJOURNMENT and PARLIAMENT.

PROSCRIPTION, *Proſcriptio*, a publication made in the name of the chief or leader of a party, whereby he promiſes a reward to any one who ſhall bring him the head of one of his enemies.

PROSE, *Proſa*, the natural language of mankind, looſe and unconfined, by poetical meaſures, rhymes, &c. in which ſenſe it ſtands oppoſed to verſe.

PROSECUTOR, in law, he that purſues a cauſe in another's name.

PROSELYTE, a new convert to ſome religion or religious ſect.

PROSODY, *Proſodia*, that part of grammar which treats of the quantites and accents of ſyllables, and the manner of making verſes.

PROSOPOPOEIA, Προσωποποιία, a figure in rhetoric, whereby we raiſe qualities, or things inanimate, into perſons. This figure is divided into two parts: 1. when good and bad qualities, accidents, and things inanimate, are introduced as living and rational beings.

The ſecond part of this figure is when we give a voice to inanimate things, and make rocks, woods, rivers, buildings, &c. expreſs the paſſions of rational creatures.

PROSTATÆ, in anatomy, a gland generally ſuppoſed to be two ſeparate bodies, though in reality but one, of a roundiſh, or ſomewhat heart-faſhioned ſhape, ſituated juſt before the neck of the bladder, and ſurrounding the beginning of the urethra.

PROSTHA-

PROSTHAPHÆRESIS, προσθαφαιρησις, in aſtronomy, the difference between the true and mean motion, or true and mean place, of a planet, called alſo equation of the orbit, or of the center, and ſimply equation.

Proſthaphæreſis amounts to the difference between the mean and equated anomaly.

PROSTHESIS, in grammar, the prefixing ſome letter or ſyllable at the beginning of a word, as in *gnatus*, for *natus*, &c.

PROSTHESIS, among ſurgeons, is the ſupplying that which is deficient by the appoſition of new matter, as the filling up ulcers, wounds, &c. with new fleſh.

PROSTYLE, in antient architecture, a range of columns in the front of a temple.

PROTASIS, in the antient drama, the firſt part of a comic or tragic piece, wherein the ſeveral perſons are ſhewn, their characters intimated, and the ſubject of the piece propoſed and entered upon.

PROTECTION, the ſhelter, defence, authority, and aid employed by any one in behalf of another.

PROTECTOR, a perſon who undertakes to ſhelter and defend the weak, helpleſs, and diſtreſſed.

PROTECTOR is alſo ſometimes uſed for a regent of a kingdom, made choice of to govern it during the minority of a prince.

PROTEST, in law, is a call of witneſs, or an open affirmation that a perſon does, either not at all, or but conditionally, yield his conſent to any act, or to the proceeding of any judge in a court in which his juriſdiction is doubtful; or to anſwer upon his oath farther than he is bound by law.

PROTEST, in commerce, is a ſummons wrote by a notary public to a merchant, banker, or the like, to accept or diſcharge a bill of exchange drawn on him, after his having refuſed either to accept or pay it.

PROTESTANT, a name firſt given in Germany to thoſe who adhered to the doctrine of Luther; becauſe in 1529, they proteſted againſt a decree of the emperor Charles V. and the diet of Spires; declaring that they appealed to a general council. The name has alſo been given to thoſe of the ſentiments of Calvin, and is now become a common denomination for all thoſe of the reformed churches.

PROTHONOTARY, a term which properly ſignifies firſt notary, and which was anciently the title of the principal notaries of the emperors of Conſtantinople.

PROTHONOTARY with us is uſed for an officer in the court of King's Bench and common pleas; the former of which courts has one, and the latter three. The Prothonotary of the King's Bench records all civil actions ſued in that court, as the clerk of the crown-office does all criminal caſes.

PROTHYRIS, in the ancient architecture, is ſometimes uſed for a quoin or ſtone in the corner of a wall, and ſometimes for a croſs beam or rafter. Prothyris is alſo uſed by Vignola for a particular ſort of key of an arch; an inſtance of which is found in the Ionic order: it conſiſts of a roll of water-baſes between two reglets and two fillets, crowned with a Doric cymatium; its figure greatly reſembling that of modillion.

PROTHYRUM, in architecture, a porch at the outer door of a houſe.

PROTO-TYPE is the original or model after which a thing was formed, but chiefly uſed for the patterns of things to be engraved, caſt, &c.

PROTRACTION, in ſurveying, the ſame with plotting. See the article PLOTTING.

PROTRACTOR, in ſurgery, a kind of forceps, ſo called from extracting foreign bodies out of wounds.

PROTRACTOR is alſo the name of an inſtrument uſed for protracting or laying down on paper the angles of a field, or other figure.

The protractor is a ſmall ſemi-circle (plate CII. *fig.* 10.) of braſs, or other ſolid matter; the limb or circumference of which is nicely divided into 180 degrees; it ſerves not only to draw angles on paper, or any plane, but alſo to examine the extent of thoſe already laid down. For this laſt purpoſe let the ſmall point, A, in the center of the protractor, be placed above the angular point, and let the ſide AB coincide with one of the ſides that contain the angle propoſed; then the number of degrees cut off by the other ſide, computing on the protractor from B, will ſhew the quantity of the angle that was to be meaſured.

PROTUBERANCE, in anatomy, is any eminence, whether natural or preter-natural, that projects or advances out beyond the reſt.

PROVEND, or PROVENDER, originally ſignified a kind of veſſel containing the meaſure of corn daily given to a horſe, or other beaſt of labour, for his ſubſiſtence: but it is now uſed for all the food given to cattle.

PROVERB, according to Camden, is a conciſe, witty, and wiſe ſpeech, grounded upon experience, and for the moſt part containing ſome uſeful inſtruction.

Book of PROVERBS, a canonical book of the Old-Teſtament, containing a part of the proverbs of Solomon, the ſon of David, king of Iſrael. The firſt twenty-four chapters are acknowledged to be the genuine work of that prince; the next five chapters are a collection of ſeveral of his proverbs, made by order of king Hezekiah; and the two laſt ſeem to have been added, though belonging to different and unknown authors, Agur the ſon of Jakeh, and king Lemuel.

In this excellent book are contained rules for the conduct of all conditions of life; for kings, courtiers, maſters, ſervants, fathers, mothers, children, &c.

PROVIDENCE. the conduct and direction of the ſeveral parts of the univerſe, by a ſuperior intelligent Being.

The notion of a providence is founded on this ſuppoſition, that the Creator has not ſo fixed and aſcertained the laws of nature, nor ſo connected the chain of ſecond cauſes, as to leave the world to itſelf; but that he ſtill preſerves the reins in his own hands, and occaſionally interpoſes, alters, enforces, reſtrains, and ſuſpends thoſe laws by a particular interpoſition.

Some, with the Epicureans, deny a providence, as imagining it inconſiſtent with the happineſs of the divine nature.

Others again deny the exiſtence of a providence, on account of the ſeemingly unjuſt diſtribution of good and evil.

Simplicius argues thus for a providence: If God do not look to the affairs of the world, it is either becauſe he cannot or will not; but the firſt is abſurd, ſince to govern cannot be difficult, when to create was eaſy; and the latter is both abſurd and blaſphemous. See GOD.

The ſentiments of Cicero are likewiſe very preciſe and pertinent to this purpoſe: he thinks it impoſſible for one who duly conſiders the innumerable objects of the univerſe, and their invariable order and beauty, to entertain the leaſt doubt, but that there is ſome efficient cauſe who preſides over and directs the mighty fabric! Nay he lays it down as a fundamental principle of all ſocieties, that there is a divine providence, which directs all events, obſerves the actions of mankind, whether good or bad, diſcerns the very intention of the heart, and will certainly make a difference between good men and the wicked.

Nuns of PROVIDENCE, a community of young women at Paris, who make two vows, viz. of chaſtity and obedience. They are habited in black, and board young ladies who chooſe to be educated among them.

PROVINCE, in geography, a diviſion of a kingdom or ſtate, compriſing ſeveral cities, towns, &c. all under the ſame government, and uſually diſtinguiſhed by the extent either of the civil or eccleſiaſtical juriſdiction.

PROVINE, a branch of a vine laid in the ground to take root and propagate.

PROVISO, in law, a condition inſerted in a deed, upon the obſervance of which the validity of the deed depends.

PROVOCATIVE, in phyſic, a medicine which is ſuppoſed to ſtrengthen nature, and incites to venery.

PROVOST, *Præpoſitus*, an officer, whereof there are divers kinds, civil, military, &c.

PROVOST *of a city or town*, is the chief municipal magiſtrate in ſeveral trading cities, particularly Edinburgh, Paris, &c. being much the ſame with mayor in other places.

PROVOST *Marſhal of an Army*, is an officer appointed to ſeize and ſecure deſerters, and all other criminals.

PROXY, *Procurator*, a perſon who officiates as a deputy in the room of another.

Sal PRUNELLÆ, in chemiſtry. See the article NITRE.

PRUNES, in commerce, are plums dried in the ſunſhine, or in an oven.

PRUNIFEROUS TREES, thoſe with pretty large and fleſhy fruit, with a nucleus in the middle, and called by botaniſts a drupe.

PRUNING, in gardening and agriculture, is the lopping off the ſuperfluous branches of trees, in order to make them bear better fruit, grow higher, or appear more regular.

There is not any part of gardening, which is of more general uſe than that of pruning; and yet it is very rare to ſee fruit-trees ſkilfully managed: and almoſt every gardener will pretend to be a maſter of this buſineſs, though there are but few who rightly underſtand it; nor is it to be learned by rote, but requires a ſtrict obſervation of the different manners of growth of the ſeveral ſorts of fruit-trees; ſome requiring to be managed one way, and others muſt be treated in a quite different method, which is only to be known from carefully obſerving how each kind is naturally diſpoſed to produce its fruit: for ſome ſorts produce their fruit on the ſame year's wood, as vines; others produce their fruits, for the moſt part, upon the former year's wood, as peaches, nectarines, &c. and others upon curſons or ſpurs, which are produced upon wood of three, four, or five, to fifteen or twenty years old, as pears, plums, cherries, &c. therefore, in order to the right management of fruit-trees, there ſhould always be proviſion made to have a ſufficient quantity of bearing wood in every part of the trees, and, at the ſame time, there ſhould not be a ſuperfluity of uſeleſs branches, which would exhauſt the ſtrength of the trees, and cauſe them to decay in a few years.

The reaſons which have been laid down for pruning of fruit-trees, are as follow: firſt, to preſerve trees longer in a vigorous bearing ſtate; the ſecond is, to render the trees more beautiful to the eye; and, thirdly, to cauſe the fruit to be larger, and better taſted.

1. It preſerves a tree longer in an healthy bearing ſtate; for by pruning off all ſuperfluous branches, ſo that there are no more left upon the tree than are neceſſary, or than the roots can nouriſh properly, the root is not exhauſted in ſupplying uſeleſs branches, which muſt afterwards be cut out; whereby much of the ſap will be uſeleſsly expended.

2. By ſkilful pruning of a tree, it is rendered much more pleaſing to the eye: but here I would not be underſtood to be an advocate for a ſort of pruning which I have ſeen too much practiſed of late; viz. the drawing a regular line againſt the wall, according to the ſhape or figure they would reduce the tree to, and cutting all the branches, ſtrong or weak, exactly to the chalked line; the abſurdity of which practice will ſoon appear to every one who will be at the pains of obſerving the difference of thoſe branches ſhooting the ſucceeding ſpring. All therefore that I mean by rendering a tree beautiful, is, that the branches are all pruned according to their ſeveral ſtrengths, and are nailed at equal diſtances in proportion to the different ſizes of their leaves and fruit; and that no part of the wall, ſo far as the trees are advanced, be left unfurniſhed with bearing wood. A tree well managed, though it does not repreſent any regular figure, yet will appear very beautiful to the ſight, when it is thus dreſſed, and nailed to the wall.

3. It is of great advantage to the fruit; for the cutting away all uſeleſs branches, and ſhortening all the bearing ſhoots, according to the ſtrength of the tree, will render the tree more capable to nouriſh thoſe which are left remaining, ſo that the fruit will be much larger, and better taſted. And this is the advantage which thoſe trees againſt walls or eſpaliers have to ſuch as are ſtandards, and are permitted to grow as they are naturally inclined; for it is not their being trained either to a wall or eſpalier which renders their fruit ſo much better than ſtandards, but becauſe they have a leſs quantity of branches and fruit for their roots to nouriſh; and, conſequently, their fruit will be larger, and better taſted.

There are many perſons who ſuppoſe, that if their fruit-trees are but kept up to the wall or eſpalier, during the ſummer-ſeaſon, ſo as not to hang in very great diſorder, and, in winter, to get a gardener to prune them, it is ſufficient: but this is a very great miſtake; for the greateſt care ought to be employed about them in the ſpring, when the trees are in vigorous growth; which is the only proper ſeaſon to procure a quantity of good wood in the different parts of the tree, and to diſplace all uſeleſs branches, as ſoon as they are produced, whereby the vigour of the tree will be intirely diſtributed to ſuch branches only, as are deſigned to remain; which will render them ſtrong, and more capable to produce good fruit; whereas, if all the branches are permitted to remain, which are produced, ſome of the more vigorous will attract the greateſt ſhare of the ſap from the tree, whereby they will be too luxuriant for producing fruit, and the greateſt part of the other ſhoots will be ſtarved, and rendered ſo weak, as not to be able to produce any thing elſe but bloſſoms and leaves, as hath been before mentioned; ſo that it is impoſſible for a perſon, let him be ever ſo well ſkilled in fruit-trees, to reduce them into any tolerable order by winter pruning only, if they are wholly neglected in the ſpring.

There are others, who do not intirely neglect their trees during the ſummer ſeaſon, as thoſe before mentioned; but yet do little more good to them by what they call ſummer pruning; for theſe perſons neglect their trees at the proper ſeaſon, which is in April and May, when their ſhoots are produced, and only about Midſummer go over them, nailing in all their branches, except ſuch as are produced fore-right from the wall, which they cut out; and at the ſame time often ſhorten moſt of the other branches; all which is intirely wrong practice; for thoſe branches which are intended for bearing the ſucceeding year, ſhould not be ſhortened during the time of their growth, which will cauſe them to produce two lateral ſhoots from the eyes, below the place where they were ſtopped, which ſhoots will draw much of the ſtrength from the buds of the firſt ſhoot, whereby they are often flat, and do not produce their bloſſoms; and if thoſe two lateral ſhoots are not intirely cut away at the winter pruning, they will prove injurious to the tree, as the ſhoots which theſe produce will be what the French call water-ſhoots: and in ſuffering thoſe luxuriant ſhoots to remain upon the tree until Midſummer, before they are diſplaced, they will exhauſt a great ſhare of the nouriſhment from the other branches, as was before obſerved; and by ſhading the fruit all the ſpring-ſeaſon, when they are cut away, and the other branches faſtened to the wall, the fruit, by being ſo ſuddenly expoſed, will receive a very great check, which will cauſe their ſkins to grow tough, and thereby render them leſs delicate. This is to be chiefly underſtood of ſtone-fruit and grapes; but pears and apples, being much hardier, ſuffer not ſo much, though it is a great diſadvantage to thoſe alſo, to be thus managed.

It muſt alſo be remarked, that peaches, nectarines, apricots, cherries, and plums, are always in the greateſt vigour, when they are the leaſt maimed by the knife; for, where theſe trees have large amputations, they are very ſubject to gum and decay; ſo that it is certainly the moſt prudent method carefully to rub off all uſeleſs buds when they are firſt produced, and pinch others, where new ſhoots are wanted to ſupply the vacancies of the wall; by which management trees may be ſo ordered, as to want but little of the knife in winter pruning, which is the ſureſt way to preſerve theſe trees healthful, and is performed with leſs trouble than the common method.

The management of pears and apples is much the ſame with theſe trees in ſummer; but in winter they muſt be very differently pruned: for, as peaches and nectarines do, for the moſt part, produce their fruit upon the former year's wood, and therefore muſt have their branches ſhortened according to their ſtrength, in order to produce new ſhoots for the ſucceeding year; ſo pears, apples, plums, and cherries, on the contrary, producing their fruit upon curſons or ſpurs, which come out of the wood of five, ſix or ſeven years old, ſhould not be ſhortened, becauſe thereby thoſe buds which were naturally diſpoſed to form

theſe curſons or ſpurs, would produce wood-branches, whereby the trees would be filled with wood, but never produce much fruit; and as it often happens, that the bloſſom-buds are firſt produced at the extremity of the laſt year's ſhoot, ſo, by ſhortening the branches, the bloſſoms are cut way, which ſhould always be carefully avoided.

There are ſeveral authors who have written on the ſubject of pruning in ſuch a prolix manner, that it is impoſſible for a learner to underſtand their meaning: theſe have deſcribed the ſeveral ſorts of branches, which are produced on fruit-trees; as wood-branches, fruit-branches, irregular branches, falſe branches, and luxuriant branches; all which they aſſert, every perſon who pretends to pruning, ſhould diſtinguiſh well: whereas there is nothing more in all this but a parcel of words to amuſe the reader, without any real meaning; for all theſe are comprehended under the deſcription already given of luxuriant or uſeleſs branches, and ſuch as are termed uſeful for fruit-bearing branches: and, where due care is taken in the ſpring of the year, to diſplace theſe uſeleſs branches, as was before directed, there will be no ſuch thing as irregular, falſe, or luxuriant branches, at the winter pruning; therefore it is to no purpoſe to amuſe people with a cant of words, which, when fully underſtood, ſignify juſt nothing at all.

The following hints will be of great uſe in pruning ſtandard trees.

Firſt, you ſhould never ſhorten the branches of theſe trees, unleſs it be where they are very luxuriant, and grow irregular on one ſide of the tree, attracting a great part of the ſap of the tree, whereby the other parts are unfurniſhed with branches, or are rendered very weak; in which caſe the branch ſhould be ſhortened down as low as is neceſſary, in order to obtain more branches, to fill up the hollow of the tree: but this is only to be underſtood of pears and apples, which will produce ſhoots from wood of three, four, or more years old; whereas moſt ſorts of ſtone fruit will gum and decay, after ſuch amputations.

But from hence I would not have it underſtood, that I would direct the reducing of theſe trees into an exact ſpherical figure, ſince there is nothing more deteſtable than to ſee a tree, which ſhould be permitted to grow as it is naturally diſpoſed, with its branches produced at proportionable diſtances, according to the ſize of the fruit, by endeavouring to make it exactly regular at its head, ſo crouded with ſmall weak branches as to prevent the air from paſſing between them, which will render it incapable to produce fruit. All that I intend by this ſtopping of luxuriant branches, is only when one or two ſuch happen on a young tree, where they intirely draw all the ſap from their weaker branches, and ſtarve them: and then it is proper to uſe this method, which ſhould be done in time, before they have exhauſted the roots too much.

Whenever this happens to ſtone fruit, which ſuffer much more by cutting than the former ſorts, it ſhould be remedied by ſtopping or pinching thoſe fruits in the ſpring, before they have obtained too much vigour; which will cauſe them to puſh out ſide branches, whereby the ſap will be diverted from aſcending too faſt to the leading branch, as hath been directed for wall trees; but this muſt be done with caution, as before.

You muſt alſo cut out all dead or decaying branches, which cauſe their head to look very ragged; eſpecially at a time when the leaves are upon the tree, theſe being deſtitute of them, have but a deſpicable appearance; beſides, theſe will attract noxious particles from the air, which are injurious to the trees; therefore the ſooner they are cut out the better: in doing of this you ſhould obſerve to cut them cloſe down to the place where they were produced, otherwiſe that part of the branch left will decay, and prove equally hurtful to the tree; for it ſeldom happens, when a branch begins to decay, that it does not die quite down to the place where it was produced. and, if permitted to remain long uncut, does often infect ſome of the other parts of the tree. If the branches are large which you cut off, it will be very proper, after having ſmoothed the cut part exactly even with a knife, chiſſel, or hatchet, to put on a plaſter of grafting clay, which will prevent the wet from ſoaking into the tree at the wounded part.

All ſuch branches as run acroſs each other, ſhould alſo be cut out; for theſe not only occaſion a confuſion in the head of the tree, but by lying over each other, rub off their bark by their motion, and very often occaſion them to canker, to the great injury of the tree; and on old trees, eſpecially apples, there are often young vigorous ſhoots from the old branches near the trunk, which grow upright into the head of the trees: theſe therefore ſhould carefully be cut out every year, leſt, by being permitted to grow, they fill the tree too full of wood; which ſhould always be guarded againſt, ſince it is impoſſible for ſuch trees to produce ſo much, or ſo good fruit, as thoſe trees whoſe branches grow at a farther diſtance; whereby the ſun and air freely paſs between them, in every part of the tree. *Miller's Gard. Dict.*

PRUNUS, the plum-tree, in botany. See the article PLUM-TREE.

PRUSSIA, a province of Poland, ſituated on the coaſt of the Baltic ſea, and divided into Regal and Ducal Pruſſia, the firſt ſubject to Poland, and the laſt to the king of Pruſſia.

PRUSSIAN-BLUE, among painters, &c. is prepared by precipitating a ſolution of green vitriol and alum with a lixivium drawn from fixed alkaline ſalt that has been calcined with animal coals. Commonly about three parts of alkali and two of dried ox-blood are calcined ſo long as any flame appears, then thrown into boiling water, and the ſtrained decoction poured into a hot mixture of ſolutions of four parts of alum and one or leſs of vitriol. The liquor becomes inſtantly thick or curdly, and looks at firſt of a greyiſh colour, which changes to a brown, and in a little time to a bluiſh green. The matter being well ſtirred together, and mixed with a quantity of hard ſpring water, a green precipitate ſubſides: ſpirit of ſalt poured upon the edulcorated powder, diſſolves a part, and leaves the reſt blue.

Mr. Geoffroy is the beſt who has given a plauſible theory of this proceſs, or any rational means for improving it. He obſerves, that the Pruſſian blue is no other than the iron of the vitriol, revived by the inflammable matter of the alkaline lixivium, and perhaps brightened by an admixture of the white earth of the alum; the green colour proceeds from a part of the yellow ferrugineous calx or ochre unrevived, mixing with the blue; and that this ſpirit of ſalt diſſolves this ochre more readily than the blue part, though it will diſſolve that alſo by long ſtanding, or if uſed in too large quantity. From theſe principles he was led to increaſe the quantity of inflammable matter, that there might be enough to revive the whole of the ferrugineous ochre, and produce a blue colour at once without the uſe of the acid ſpirit: in this he perfectly ſucceeded, and found at the ſame time, that the colour might be rendered of any degree of deepneſs or lightneſs at pleaſure. If the alkali is calcined with twice its weight of dried blood, and the lixivium, obtained from it, poured into a ſolution of one part of vitriol to ſix of alum, the liquor acquires a very pale blue colour, and depoſites as pale a precipitate: on adding more and more of a freſh ſolution of vitriol the colour becomes deeper and deeper, almoſt to a blackneſs. He imagines with great probability, that the blue pigment thus prepared will prove more durable in the air, mingle more perfectly with other colours, and be leſs apt to injure the luſtre of ſuch things as are mixed or applied in its neighbourhood, than that made in the common manner; the tarniſh and other inconveniencies, to which common Pruſſian blue is ſubject, ſeeming to proceed from the acid ſpirit, which cannot be totally ſeparated by any ablution. He takes notice of an amuſing phœnomenon, which happens upon mixture. When the liquors are well ſtirred together, and the circular motion as ſoon as poſſible ſtopt; ſome drops of ſolution of vitriol, depurated by long ſettling, let fall on different parts of the ſurface, divide, ſpread, form curious repreſentations of flowers, trees, ſhrubs, flying inſects, &c. in great regularity and perfection: theſe continue ten or twelve minutes; and on ſtirring the liquor again, and dropping in ſome more of the ſolution of vitriol, are ſucceeded by a new picture.

Mr. Macquer has ingeniouſly applied the preparation of this pigment to the dying of wool and ſilk; and found means of fixing the blue fecula in their pores. By dipping cloth firſt in a diluted ſolution of vitriol and alum, then in the ley diluted, and afterwards in water acidulated with ſpirit of vitriol, it acquires a light blue colour; which becomes deeper and deeper on repeating the dippings alternately in the ſame order as before; and adding to the liquors each time a little more of the reſpective ſaline matters. This blue dye, he ſays, in beauty and luſtre exceeds that of indigo and woad as far as ſcarlet does the madder red; and penetrates the whole ſubſtance of fulleſt cloth, without weakening it. The colour is durable in the air, and ſtands boiling with alum water, but is diſcharged by ſope, and, without certain precautions, liable to be ſpecky or unequal. See the *Memoirs of the French Academy for the year* 1749.

PSALM, ψαλμος, a divine ſong or hymn; but chiefly appropriated to the hundred and fifty Pſalms of David, a canonical book of the Old Teſtament.

Moſt of the Pſalms have a particular title, ſignifying either the name of the author, the perſon who was to ſet it to muſic or ſing it, the inſtrument that was to be uſed, or the ſubject and occaſion of it. Some have imagined, that David was the ſole author of the Book of Pſalms; but the title of many of them prove the contrary, as Pſalm xix. which appears to have been written by Moſes. Many of the Pſalms are inſcribed with the names Korah, Jeduthun, &c. from the perſons who were to ſing them. Pſalm lxxii. and cxxvii. are under the name of Solomon; the former being compoſed by David for the uſe of his ſon, and the latter being probably compoſed by Solomon himſelf.

The authority and canonicalneſs of the book of Pſalms has always been acknowledged, both by Jews and Chriſtians. However, nothing can be a greater argument of its obſcurity than the great number of commentaries upon them.

PSALMODY, ψαλμοδια, the art or act of ſinging pſalms.

PSALTER, ψαλτηριον, the ſame with the book of Pſalms.

PSALTERY, ψαλτηριον, a muſical inſtrument, much in uſe among the ancient Hebrews, who called it nebel.

PSEUDO, from ψευδος, a Greek term uſed in the compoſition of many words, to denote falſe, or ſpurious; as the pſeudo-acacia, or baſtard acacia; pſeudo-fumaria, or baſtard-fumitory; pſeudo-ruta, or baſtard-rue, &c.

PSITTACUS, the PARROT, in ornithology. See the article PARROT.

PSOAS, in anatomy, the name of two muſcles, diſtinguiſhed by the epithets magnus and parvus. The pſoas magnus is one of the flexor muſcles of the thigh, and ariſes from the firſt, ſecond, third, and fourth vertebræ of the loins. The pſoas parvus is one of the flexor-muſcles of the loins, which ariſes by a ſlender tendon from the os pubis, where it is joined to the ilium; and is inſerted into the ſide of the upper vertebra of the loins; it is often wanting, and when found, its office is to aſſiſt the quadratus in elevating the oſſa innominata, eſpecially when we lie down.

PSORA, ψορα, in medicine, the ſame with the itch. See the article ITCH.

PSYCHOLOGY, ψυχολογια, that branch of anthropology which treats of the ſoul, its faculties, paſſions, &c.

PSYCHOMANCY, ψυχομαντεια, a kind of divination, performed by raiſing the ſouls of perſons deceaſed.

PSYCROMETER, an inſtrument for meaſuring the degrees of coldneſs or heat in the air, and more uſually called thermometer. See THERMOMETER.

PTERYGOIDE, ſomething reſembling a wing; from a reſemblance to which, four apophyſes or proceſſes of the os ſphenoides have been called pterygoide.

PTERYGOIDÆUS, in anatomy, the name of two muſcles of the lower jaw, one internal and the other external. The internal pterygoidæus muſcle has its origin in the cavity of the pterygoide proceſs, and its termination is in the interior and lower ſuperficies of the angle of the jaw. The external pterygoidæus ariſes from the exterior lamina of the ſame proceſs, and terminates a little above the inſertion of the other.

There are alſo ſeveral pairs of muſcles of the pharynx and uvula, as the pterygo-pharyngæus, and pterygo-ſtaphylinus, which have got their names from being connected by the ſame proceſs. The pterygo-ſtaphylinus ariſes from the upper part of the ſaid proceſs, and deſcending between its two lamellæ, turns back its tendon over the thin apophyſis of the interior lamella, as over a pulley, to the anterior part of the membrane of the palate, into which it is inſerted, and ſerves to draw the uvula downwards and forwards.

PTOLEMAIC, or PTOLEMÆAN *Syſtem of Aſtronomy*, is that invented by Claudius Ptolemæus, a celebrated aſtronomer and mathematician of Peluſium, in Egypt, who lived in the beginning of the ſecond century of the Chriſtian ærea.

This hypotheſis ſuppoſes the earth immoveably fixed in the center, not of the world only, but alſo of the univerſe; and that the ſun, the moon, the planets, and ſtars all move about it, from eaſt to weſt, once in twenty-four hours, in the order following, viz. the moon next to the earth, then Mercury, Venus, the Sun, Mars, Jupiter, Saturn, the fixed ſtars, the firſt and ſecond cryſtalline heavens, and above all the fiction of their primum mobile. See (plate CV. *fig.* 9.) See alſo MOON, &c.

This ſyſtem or hypotheſis was firſt invented, and adhered to, chiefly becauſe it ſeemed to correſpond with the ſenſible appearances of the celeſtial motions. They took it for granted, that the motions which thoſe bodies appeared to have, were ſuch as they truly and really performed: and not dreaming of any motion in the earth, nor being apprized of the diſtinction of abſolute and relative or apparent motion, they could not make a proper judgment of ſuch matters; but were under a neceſſity of being miſled by their ſenſes, for want of the aſſiſtances we now enjoy.

It is eaſy to obſerve, they had no notion of any other ſyſtem but our own, nor of any other world but the earth on which we live. They imagined that all the fixed ſtars were contained in one concave ſphere, and that the primum mobile was circumſcribed by the empyreal heaven, of a cubic form, which they ſuppoſed to be heaven, or the bliſsful abode of departed ſouls.

It would ſcarce have been worth while to have ſaid ſo much about ſo abſurd an hypotheſis, as this is now well known to be, were it not that there are ſtill numerous retainers thereto, who endeavour very zealouſly to defend the ſame, and that for two reaſons principally, viz. becauſe the earth is apparently fixed in the center of the world, and the ſun and ſtars ſeem to move about it daily; and alſo becauſe the Scripture aſſerts the ſtability of the earth, the motion of the ſun, &c. But that the diurnal motion of the earth occaſions all theſe appearances, we have abundantly proved under the articles DIURNAL and COPERNICAN.

PTYALISM, πτυαλισμος, in medicine, a ſalivation, or frequent and copious diſcharge of ſaliva.

PUBERTY, *Pubertas*, among civilians, &c. the age wherein a perſon is capable of procreation, or begetting children.

Boys arrive at puberty at fourteen years of age, and girls at twelve; eighteen years of age is accounted full puberty.

PUBES, among anatomiſts, &c. denotes the middle part of the hypogaſtric region of the abdomen, lying between the two inguina or groins. See the article ABDOMEN.

PUBLICAN, *Publicanas*, among the Romans, one who farmed the taxes and public revenues.

PUBLICATION, *Publicatio*, the act of making a thing known to the world; the ſame with promulgation.

PUCERON, *Podura*, in zoology, a genus of wingleſs inſects with fewer than ſix pair of legs. The body is ſhort and roundiſh; the tail is crooked and forked; the legs are three pairs, and ſerve only for walking; and the eyes are two, but each compoſed of eight leſſer ones.

The pucerons are extremely numerous, living on the young branches of trees and plants; and often found in ſuch cluſters as wholly to cover them: they are uſually denominated from the trees and places where they are found;

found; there being ſcarce a vegetable, either in the fields or gardens, that has not a peculiar ſpecies of puceron to feed on its juices,

PUDENDA, the parts of generation in both ſexes. See the article GENERATION.

PUDDENING, a thick roll of rope faſtened about the maſt of a ſhip to prevent the yard from falling down when the rigging is ſhot away

PUERILITY, in diſcourſe, is defined by Longinus to be a thought, which, by being too far-fetched, becomes flat and inſipid.

Puerility, he adds, is the common fault of thoſe who affect to ſay nothing but what is brilliant and extraordinary.

PUGIL, *Pugillus*, in phyſic, &c. ſuch a quantity of flowers, ſeeds, or the like, as may be taken up between the thumb and two fore-fingers.

It is eſteemed to be the eighth part of the manipule or handful.

PUISNE, or PUNY, in law, one younger born.

PULLEY, in mechanics, one of the five mechanical powers, called by the Latins *trochlea*, and by the ſeamen a tackle.

If ADBE (plate CVI. *fig.* 1.) be a pully upon which hang the weights PW; then ſince the neareſt diſtances of the ſtrings A P and B W, from the center of motion C, are AC and BC, the pully will be reduced to the lever or ballance AB, with reſpect to its power; and from thence it appears that, ſince AC = BC, we ſhall always have P = W, for an equilibrium; and, therefore, no advantage in raiſing a weight, &c. can be had from a ſingle pulley.

In a combination of two pullies, AB and DFEG, (*fig.* 2.) the power is doubled; for the pulley DFEG is reducible to the lever ED, which muſt be conſidered as fixed in the point E to the immoveable ſtring HE; and the power acting at D is equal to P, and the weight W is ſuſtained from the center C of the pulley; but P : W :: CE : DE; therefore, ſince DE = 2 CE, it is W = 2P, or P = $\frac{1}{2}$W.

The force of the pullies may alſo be eaſily ſhewn by comparing the velocities of the power and weight; for it is evident, if the weight W (*fig.* 3.) be raiſed one inch, each ſtring HE, DB, will be ſhortened one inch, and conſequently the ſtring AP will be lengthened two inches; and ſo P will paſs through twice the ſpace that W does, in the ſame time: conſequently the tackle of pullies, in the form of *fig.* 4. will increaſe the power five times; and that of *fig.* 5. and 6 will increaſe it ſix times.

In the diſpoſition of pullies according to *fig.* 8. it is plain, ſince each pulley has a fixed rope, it muſt be conſidered as a lever of the ſecond ſort, and ſo will double the power of the fore-going pulley; and ſo four pullies will increaſe the power ſixteen times.

Tho' the laſt-mentioned form be of the greateſt force from the ſame number of pulleys; yet, if we conſider the ſimplicity, force, and conveniency of the tackle of pullies altogether, none is ſuperior to that of the form of *fig.* 7. where the uppermoſt pulley is fixed, and each has a rope annexed to the weight; its power is therefore thus eſtimated: when the weight W is raiſed one inch, the rope AB will be lengthened as much, and ſo the pulley C will deſcend one inch, by which means the rope CD will be lengthened two inches, and one by the riſing of the weight W; wherefore the pulley E will deſcend three inches; and thus the rope EP will be lengthened ſix inches by that means (viz. three on each ſide); alſo, the riſing of the weight will cauſe it to lengthen one inch more, ſo that the power P goes through ſeven inches, while the weight W riſes one: therefore, P : W :: 1 : 7. And thus you proceed for any other number.

The following curious and uſeful combination of pullies is given by the ingenious Mr. Smeaton in the XLVIIth Vol. of the *Philoſophical Tranſactions*.

The preſent method of arranging pullies in their blocks may be reduced to two. The firſt conſiſts in placing them one by the ſide of another, upon the ſame pin; the other in placing them directly under one another, upon ſeparate pins. But in each of theſe methods an inconvenience ariſes, if above three pullies are framed in one block. For, according to the firſt method, if above ſix pullies are placed by the ſide of one another, as the laſt line, by which the draught is made, or, as it is uſually called, the fall of the tackle, muſt neceſſarily be on the outſide pulley or ſhieve, the difference of their friction will give it ſo great a tendency to pull the block away, that as much will be loſt by the rubbing of the ſhieves againſt the block, on account of its obliquity, as will be got by increaſing the number of lines.

The ſecond method is free from this objection; but, as the length of the two blocks, taken together, muſt be equal to the ſum of the diameters of the ſix pullies, beſides the ſpaces between for the ropes, and the neceſſary appendages of the framing, were there more than three pullies in each block, they would run out into ſuch an inconvenient length, as to deduct very conſiderably from the height, to which the weight might otherwiſe have been raiſed; ſo that upon thoſe accounts, no very great purchaſe can be made by the common tackles of pullies alone.

In order therefore to encreaſe its power, ſometimes a ſecond tackle is fixed upon the fall of the firſt; but here it is obvious, that, whatever be the power of the ſecond tackle, the height to which the weight might otherwiſe have been raiſed by the firſt, will be leſs in the ſame proportion as the purchaſe is encreaſed by the ſecond.

Again, very frequently the fall of the firſt tackle is applied to an axis in peritrochio, which increaſes the purchaſe very commodiouſly without the inconveniences laſt mentioned; but then the machine is rendered cumberſome, and, conſequently, leſs fit for a moveable apparatus.

All thoſe impediments I have avoided, by combining the two methods, above deſcribed, in one. The pullies are here placed in each block in two tier; ſeveral being upon the ſame pin as in the firſt method, and every one having another under it, as in the ſecond; as alſo that, when the tackle is in uſe, the two tier, that are the remoteſt from one another, are ſo much larger in diameter than thoſe that are neareſt, as to allow the lines of the former to go over the lines of the latter without rubbing.

From this conſtruction ariſes a new method of reeving the line upon the ſhieves: for here, let the number of ſhieves be what it will, the fall of the tackle will always be upon the middle ſhieve, or on that next the middle, according as the number of pullies on each pin is odd or even.

To do this the line is fixed to ſome convenient part of the upper block, and brought round the middle ſhieve of the larger tier of the under block; from thence round one of the ſame ſort, next the center one of the upper block; and ſo on till the line comes to the outſide ſhieve, where the laſt line of the larger tier falls upon the firſt ſhieve of the ſmaller, and being reeved round thoſe, till it comes at the oppoſite ſide, the line from the laſt ſhieve of the ſmaller tier again riſes to the firſt of the larger, where it is conducted round, till it ends on the middle ſhieve of the upper block on the larger tier, as will appear more plain, by inſpection of plate CVI. *fig.* 9.

In this method all the lines are clear of one another, and the blocks are kept parallel. The model which I had the honour to ſhew the Society, and from which I made the draught, is a compoſition of twenty ſhieves, five on each pin. With this model, which may be eaſily carried in the pocket, I have raiſed 600 weight. But with a tackle of this ſort, properly executed in large, one man will eaſily raiſe a ton, and a greater number in proportion.

I have tried ſeveral numbers of ſhieves as far as 36; but 20 ſeems to be the largeſt number, that will anſwer well in practice.

A very commodious tackle of twelve might be executed in wood, in the ſame manner that common blocks are made.

PULMONARIA, ſage of Jeruſalem, in botany, a genus of plants, with a monopetalous flower, divided into five obtuſe and erecto-patent ſegments at the limbs: there is no pericarpium, the ſeeds, which are four, being contained in the calyx unaltered.

The leaves of ſage of Jeruſalem are accounted pec-

total and cardiac, and therefore good in all diſorders of the lungs.

PULMONARY *Veſſels*, in anatomy, are arteries and veins, which carry the blood from the heart to the lungs, and back again from the lungs to the heart.

PULMONARY *Conſumption*. See the article CONSUMPTION and PHTHISIS.

PULP, in pharmacy, the fleſhy and ſucculent part of fruits, extracted by infuſion or boiling, and paſſed through a ſieve.

Some phyſicians uſe the term pulp for the fatteſt, fulleſt, and moſt ſolid part of the fleſh of animals.

PULPIT, *pulpitum*, an elevated place in a church, from which ſermons are delivered: the French give the ſame name to a reading-deſk.

PULSE, *pulſus*, in the animal œconomy, denotes the beating or throbbing of the heart and arteries. See the articles HEART and ARTERY.

No doctrine has been involved in more difficulties than that of pulſes; ſince, in giving a phyſiological account of them, phyſicians have eſpouſed quite oppoſite ſentiments; whilſt ſome doubt whether the pulſe is owing to the ſyſtole or diaſtole; as alſo, whether the motion of the heart, and arteries, is one and the ſame, for a moment of time. See SYSTOLE and DIASTOLE.

With regard to motion, the pulſes are reckoned only four, great and little, quick and ſlow. When quickneſs and greatneſs are joined together, it becomes violent; and when it is little and ſlow, it is called a weak pulſe. They are alſo ſaid to be frequent and rare, equal and unequal; but theſe are not the eſſential affections of motion. Frequency and quickneſs are often confounded with each other. A pulſe is ſaid to be hard or ſoft, with regard to the artery, according as it is tenſe, renitent, and hard, or flaccid, ſoft, and lax; for the diſpoſitions of the arteries contribute greatly to the change of the pulſe; wherefore it ſometimes happens, that the pulſe in both arms is not alike, which is very common in a hemiplexy. Add to theſe a convulſive pulſe, which does not proceed from the blood, but from the ſtate of the artery, and is known by a tremulous ſubſultory motion, and the artery ſeems to be drawn upwards: this in acute fevers, is the ſign of death; and is ſaid to be the pulſe in dying perſons, which is likewiſe generally unequal and intermitting. A great pulſe ſhews a more copious afflux of the blood to the heart, and from thence into the arteries; a little pulſe, the contrary. See the article CIRCULATION.

The pulſes of perſons differ according to the largeneſs of the heart and veſſels, the quantity and temperies of the blood, the elaſtic force of the canals; as alſo with regard to the ſex, age, ſeaſon, air, motion, food, ſleep, watchings, and paſſions of the mind. The pulſe is larger and more quick in men than in women; in the bilious and ſanguineo-bilious, than in the phlegmatic and melancholic. Thoſe who are lean, with tenſe fibres, and larger veſſels, have a greater and a ſtronger pulſe than thoſe that are obeſe, with lax fibres and ſmall veſſels; whence they are more healthy, robuſt, and apt for labour. In children, the pulſe is quick and ſoft; in adults, greater and more violent. In the old, it is commonly great, hard, and ſlow. Labour, motion, and exerciſe of the body, encreaſe the circulation of the blood, the excretions, and particularly reſpiration; reſt renders the circulation ſlow and weak; intenſe ſpeaking increaſes the circulation, and conſequently renders the pulſe large and quick. In watching, the pulſe is more evident; in ſleep more ſlow and languid. After drinking hot things, ſuch as coffee and tea, or hot bath-waters, as well as after meals, the pulſe vibrates more quick. But nothing produces a greater change in the pulſe than affections of the mind: in terror it is unequal, ſmall, and contracted; in joy, frequent and great; in anger, quick and hard; in ſadneſs, ſlow, ſmall, deep, and weak; and in intenſe ſtudy, languid and weak. With regard to the air, when after the predominancy of a weſt or ſouth-wind, it becomes north or eaſt, the pulſe is ſtronger and larger; as alſo when the quickſilver riſes in the barometer. But when the atmoſphere is denſe, humid, rainy, with a long ſouth wind; as alſo where the life is ſedentary, the ſleep long, and the ſeaſon autumnal, the pulſe is languid and ſmall, and the perſpiration decreaſed. In May it is great, and ſometimes violent; in the middle of ſummer, quick but weak; in the autumn, ſlow, ſoft, and weak; in the winter, hard and great. A draſtic purge and an emetic render the pulſe hard, quick and weak, with loſs of ſtrength; chalybeates, and the bark, render it great and robuſt, and the complexion lively; volatiles amplify and increaſe the pulſe; acids and nitrous remedies refrigerate the body, and appeaſe the pulſe; opiates and the like render it ſmall and weak, and decreaſe the elaſticity of the ſolids; whereas things abounding with a friendly ſulphur increaſe the pulſe; but poiſons render it ſmall, contracted, and hard. When the quantity of the blood is too great, bleeding raiſes the pulſe.

The ſeveral indications of the pulſe in different diſorders, may be ſeen under the reſpective names of theſe diſeaſes.

PULSE is alſo uſed for the ſtroke with which any medium is affected by the motion of light, ſound, &c. through it.

Sir Iſaac Newton demonſtrates, that the velocities of the pulſes in an elaſtic fluid medium (whoſe elaſticity is proportionable to its denſity) are in a ratio compounded of half the ratio of the elaſtic force directly, and half the ratio of the denſity inverſely; ſo that in a medium whoſe elaſticity is equal to its denſity, all pulſes will be equally ſwift.

PULSE, *Legumen*, in botany, a term applied to all thoſe grains or ſeeds which are gathered with the hand, in contradiſtinction to corn, &c. which are reaped, or mowed: or it is the ſeed of the leguminous kind of plants, as beans, vetches, &c. but is by ſome uſed for artichokes, aſparagus, &c.

PULSION, the act of driving, or impelling a thing forwards.

PULVERIZATION, *Pulverizatio*, the art of pulverizing, or reducing a dry body into a fine powder; which is performed in friable bodies, by pounding or beating them in a mortar, &c. but to pulverize malleable ones, other methods muſt be taken. To pulverize lead, or tin, the method is this: rub a round wooden box all over the inſide with chalk; pour a little of the melted metal nimbly into the box; when, ſhutting the lid, and ſhaking the box briſkly, the metal will be reduced to powder. See the article GRANULATION.

PULVINATED, in the ancient architecture, a term applied to a frieze which ſwells or bulges out in the manner of a pillow.

PULVIS *Fulminans*, among chymiſts, a powder, ſo called from its ſmart and loud exploſion, when it begins to melt, after being placed upon an iron-plate over a gentle fire. It is prepared thus: Take three ounces of purified nitre, and one ounce of brimſtone, and grind them well together in a mortar; then putting a ſmall quantity, as about half a dram, over the fire, in the manner already mentioned, it will make a great exploſion. The more philoſophical way of accounting for this effect of the pulvis fulminans is, according to Dr. Shaw, by ſuppoſing that the acid ſpirits of the nitre and ſulphur, being looſened by the heat, ruſh towards one another, and towards the ſalt of tartar, with ſo great a violence, as, by the ſhock, at once to turn the whole into vapour and ſmoke.

PUMICE, in natural hiſtory, a ſlag or cinder of ſome foſſil, originally bearing another form, and only reduced to this ſtate by the action of the fire, though generally ranked by authors among the native ſtones. It is a lax and ſpongy matter, frequently of an obſcure, ſtriated texture, in many parts, and always very cavernous and full of holes; it is hard and harſh to the touch, but much lighter than any other body that comes under the claſs of ſtones. It is found in maſſes of different ſizes, and of a perfectly irregular ſhape, from the bigneſs of a pigeon's egg to that of a buſhel. We have it from many parts of the world, but particularly about the burning mountains, Ætna, Veſuvius, and Hecla, by whoſe eruptions it is thrown up in vaſt abundance; and being by its lightneſs ſupported in the air, is carried into ſeas at ſome diſtance, by the winds, and thence to diſtant ſhores. The great uſe of the pumice among the ancients, ſeems to have been as a dentifrice, and at preſent it is retained in the ſhops on the ſame account.

PUMP, in hydraulics, a machine, formed on the model of a ſyringe, for raiſing of water.

The theory of pump-work depends, in a great meaſure, upon the properties of the inverted ſyphon: thus, let A B C D E F G (plate CVI. *fig.* 10) repreſent an inverted ſyphon, A B C D a column of air, and D G the lower part of a pump, immerſed in the water of the well H I; let P be the piſton of the pump at E, in its loweſt ſituation, and at F in its higheſt. Now as both theſe parts communicate with the water, one by preſſing on it, the other by opening into it, they may be looked upon as communicating with one another. Wherefore A B C D, the column of air, would, by its weight or preſſure, force up a column of water into the pipe D G, to the height of thirty-two feet, were the air exhauſted from the ſaid pipe, and continued to that height; ſince the weight of a column of air is equal to that of ſuch a column of water, of the ſame baſe. If, therefore, the piſton P be thus thruſt down to E, meeting the water there, and from thence it be raiſed to F with an uniform motion, the water will riſe from E to follow the piſton with a variable motion; the leaſt of which is as $\sqrt{AC} - \sqrt{DE}$, and the greateſt as $\sqrt{AC - DE} = \sqrt{AB}$.

If in lifting up the piſton, the velocity of the water be leſs than that of the piſton, it will not be able to follow it, but will leave a ſpace between them, which will increaſe more and more, as the velocity of the water becomes leſs than that of the piſton. The conſequence of this will be, that a part of the ſtroke of the piſton will be loſt; and not only that, but the piſton, when the water leaves it, will riſe very hard, as having a weight of water upon it, and the air of greater denſity above than below; whence the equilibrium, which ought to be in pumps, is deſtroyed, and the balance againſt the workman. Now, as this can happen even where the diameter of the ſucking-pipe is equal to that of the pump-barrel, much ſooner will it happen when the ſucking-pipe is leſs than the barrel, becauſe the water, riſing through a leſs paſſage, will be longer in filling the pump-barrel, and therefore muſt quit the piſton, and leave the greater void ſpace between.

On the contrary, if the leaſt velocity of the water riſing in the pipe, be greater than that of the piſton, there will be no void ſpace; and the pump-barrel may be made in proportion, as much wider than the pipe, as the velocity of the water is greater than that of the piſton. Now that this may be the caſe, we ſhall ſhew, by calculation, what diameters the barrel and pipe ought to have, compared with the velocity of the water and piſton. Let A repreſent the leaſt altitude of the atmoſphere A C = 31 feet of water; B = D F the higheſt elevation of the piſton over the ſurface of the water H I, which let be 16 feet. And let the greateſt velocity of the piſton, which can well be given to a pump, be that of four feet in a ſecond = v; and V = the leaſt velocity of the water that riſes in the pipe; D = the diameter of the barrel; and d = the diameter of the pipe.

Now here we have $\sqrt{A} - \sqrt{B} = V$ = the leaſt velocity of water; and the fall, which will produce that velocity, is the ſquare of that expreſſion, viz. $A + B - 2\sqrt{AB}$, that is, $31 + 16 - 2\sqrt{31 + 10} = 2$ feet 6 inches, the height of the fall required. Whereas, by the common way of taking the ſquare of $\sqrt{A - B}$, viz. $A + B$ for the height, we have 15 feet for the fall, which extraordinary error muſt be of very bad conſequence in practice.

Here the velocity $\sqrt{A} - \sqrt{B} = \sqrt{31} - \sqrt{16} = 5{,}6 - 4 = 1{,}6$ per ſecond. The velocity of the water, at the bottom of the pipe D, is as $\sqrt{A} = 5{,}6$; that alſo muſt be the velocity of the piſton at D, that the water may follow it; whence the piſton moving with the ſame velocity at F, where the velocity is but 1, 6, we have 5, 6 − 1, 6 = 4 feet of void ſpace; therefore 4 parts in 5, 6 of ſuch a ſtroke would be loſt or ineffectual. We may here obſerve, by the way, that ſince the velocity of the water at D is 5, 6, and the greateſt velocity which can be given to the piſton, without damaging the machinery, is but 4; therefore a piſton, working at the lower end of the pipe or barrel, will always have water more than enough to prevent any void ſpace or loſs of labour.

But, ſince we find ſo great a void in the pipe at F, of the ſame diameter with the piſton, it is evident, if we contract all the part below F into a ſmall pipe, as FD, and let the part F G remain as it was for the barrel for the piſton to play in, as at FG, that then the water will riſe into the barrel FG with a greater velocity, than before, in proportion as the pipe is leſs; conſequently, if the bore of the pipe FD be to that of the barrel FG, as the velocity of the piſton P, or the water in the barrel, is to the velocity of the water in the pipe, there will always be a ſufficiency of water to prevent a vacuum in the barrel. Which rule in ſymbols is thus expreſſed, $D\,D : d\,d : V : v$; whence $D^2 v = d^2 V$ for a general canon; any three of which quantities being given, the fourth may be found. Thus, for example: ſuppoſe D, v and V were given to find d, we have $d = \frac{D\sqrt{v}}{\sqrt{V}}$. Let the diameter of the barrel D = 6 inches; and ſuppoſe the piſton gives 20 ſtrokes in a minute, each a two feet ſtroke, ſpending as much time in its aſcent as deſcent; then will the motion of the piſton be 80 feet per minute, or $1\frac{1}{3}$ per ſecond; whence v equals $1\frac{1}{3}$. Laſtly, to obtain the value of V, we muſt fix on the length of the pipe FD, which let be 16 feet; then the higheſt elevation of the piſton will be 18 feet, if it comes to the bottom of the barrel, as it ought to do; wherefore, an height of water of 18 feet in the pump GD, acts againſt the weight or height of 31 feet in the leg A C. Now the velocity V of the water in the pipe FD being uniform, or conſtantly the ſame, we muſt find what difference of uniform velocities will be generated by falls from 31 and 18 feet heights. Thus $\sqrt{16\frac{1}{9}} : 32 :: \sqrt{31} : 43$ nearly; and $\sqrt{16\frac{1}{4}} : 32 :: \sqrt{18} : 32\frac{1}{4}$; whence the difference of theſe uniform velocities will be $43 - 32\frac{1}{4} = 10\frac{1}{4} = 10$ feet three inches per ſecond; therefore $V = 10\frac{1}{4}$. Wherefore $\frac{D\sqrt{v}}{\sqrt{V}} = d = 2\frac{1}{10}$ inches of the diameter of the pipe FD.

The reaſon why we make no uſe of the expreſſion $\sqrt{AC} - \sqrt{DF}$ in this caſe, is becauſe this gives only the difference of the inſtantaneous velocities, or the leaſt velocity with which the water at F can begin its motion upwards; whereas we here want to find what the conſtant and uniform motion of the water will be, or how much it will ſupply every ſecond uniformly, which is done by the method above. For ſince a fall of $16\frac{1}{9}$ gives an uniform velocity of 32 feet per ſecond, a fall of 31 feet will give 43; thus a fall of 18 feet will give $32\frac{1}{4}$, and their difference muſt be that of the water at F.

If we know the velocity of the piſton v, the diameter of the barrel D, and the diameter of the pipe d, we ſhall find the velocity of the water in the pipe $V = \frac{vDD}{dd}$; or thus in words, multiply the ſquare of the diameter of the barrel by the velocity of the piſton; divide the product by the ſquare of the diameter of the pipe, the quotient will be the velocity ſought from the water in the pipe. This velocity, when found, muſt be taken from 43, the remainder 43 − V will be the uniform velocity produced by a fall from the higheſt ſituation of the piſton to the loweſt ſurface of the water in the well, and which is found by ſaying, as $32 : \sqrt{16\frac{1}{9}} :: 43 - V : \sqrt{DF}$; whence D F, the higheſt elevation of the piſton, will be known.

When we know D, V and d, we find v the velocity of the piſton by this theorem, $\frac{V\,dd}{DD} = v$; that is, in words, multiply the ſquare of the diameter of the pipe by the velocity of the water in it, and divide the product by the ſquare of the diameter of the barrel, the quotient is the velocity of the piſton required.

Having given the velocity of the water in the pipe V, the diameter of the pipe d, the velocity of the piſton v, to find the diameter of the barrel D, we have this theorem, $D = \sqrt{\frac{V\,dd}{v}}$; that is, multiply the ſquare of the diameter of the pipe by the velocity of its water, and divide that product by the velocity of the piſton; the ſquare root of the quotient is the diameter of the barrel ſought.

We ſhall now proceed to the deſcription of two or three of the moſt uſeful pumps, but firſt give an account

fo

of that ſort of valves which are exceeding good, and ought to be uſed in pumps, and all kinds of water-engines, where valves are neceſſary.

Let A B C D (*fig.* 11.) be the bucket of a piſton, or any other part where a valve is required; in the middle there is a circular but tapering hole from top to bottom, in which is fitted the tapering or conical piece E F G H, with a piece I K to be ſcrewed in and out of the bottom part H G. It is to be ſcrewed out, when the ſaid ſolid E G is put into its place or hole in A C; and afterwards ſcrewed in, when the whole together appears as in the figure L M N O P. The piece E G now becomes a valve, or capable of permitting the water to aſcend, and to prevent its deſcent.

That the water paſſing againſt the bottom of the valve will raiſe it upwards, is evident from the conical form thereof, and its lying in the hole only by its own weight; the length of the key at K being ſufficient to permit ſuch a riſe of the valve, as will admit a ſpace between it and the hole for the water to paſs as freely as required; and, that the valve may not be thrown quite out of the hole, the croſs-piece I is added, of a greater length than the diameter of the loweſt part of the valve.

If the valve E G and its ſocket A C be of braſs, and fitted, by grinding them with emery firſt and putty afterwards, with a drill bow into each other, they will not only be water-tight, but even air-tight; and that too, if but ſlightly touched with the emery or putty; for if they are ground to a poliſh, the attraction of coheſion will take place, and prevent the valve from riſing ſo freely as it ought to do; yea, ſometimes thoſe ſurfaces have been found to cohere ſo ſtrongly, that the force of the riſing water could not overcome it: but all this would be prevented, and every thing ſucceed to one's wiſh, if they were made as above directed, as has been found by long experience, and trying every way.

Kinds and Structure of PUMPS. Pumps are diſtinguiſhed into ſeveral kinds, according to the different manners of their acting; as the common ſucking pump, forcing pump, lifting pump, &c.

1. The ſtructure and action of the common ſucking pump, as it is called, has been ſo far deſcribed in the above theory of pumps, that little remains to be ſaid on it. However, it may not be improper to give a figure or two of this kind of pump, in order to ſhew its ſtructure, and the contrivances uſed in working it. *Fig.* 12. repreſents a ſimple ſu king pump, in which A is the ciſtern; A B, the barrel or pipe, ſtanding in the water E F; G D, the piſton and bucket, with its bucket and valve D; and C, the valve open for the aſcent of the water. *Fig.* 13. is a very ſimple and uſeful contrivance for working two pumps by means of the ballance A B, having large iron balls at each end, placed in equilibre on the two ſpindles C, as repreſented in the figure; on the right and left are two boards I, nailed to two croſs-pieces faſtened to the axis of the machine. On theſe two boards, the perſon who is to work the pumps, ſtands, and ſupports himſelf by four poſts, E, D, erected perpendicularly, and having croſs-pieces on the top. At the diſtance of ten inches on each ſide of the axis, are faſtened the piſtons M N, which go to the ſuckers. The man, by leaning alternately on his right and left foot, puts the ballance in motion, by which means the pumps O, P, are worked, and the water thrown into the pipe H, and carried to a height proportional to the diameter of the valves, and the action of the ballance. It will be neceſſary to place on each ſide an iron ſpring, as F, G, in order to return the ballance, and prevent its motion from being too great. *Fig.* 14. is another machine for working two pumps, where A repreſents a large weight faſtened to the axis, to regulate the motion of the machine. On each ſide of the axis B, is a piſton which goes to the ſuckers of the two pumps C, D. The machine is put in motion by the man's treading on the board E, and, conſequently, the two pumps deliver water alternately. All which is ſo plain from the figure, that it needs no farther deſcription.

2. The forcing pump, of the common ſort, is a machine thus conſtructed: A B (*fig.* 15.) is the barrel ſtanding in the well or mine at B; G C is the piſton; and C a ſolid piece without any hole or valve, becauſe no water is to paſs through it, as in the other This piece ſhould be well leathered, to fit the barrel very nicely, that in its motion neither air nor water ſhould paſs between. At a diſtance below, a valve, with its diaphragm, is fixed to the barrel, as at D. Between this and the loweſt ſituation of the piſton C, there goes off a pipe at H, in which there is fixed a diaphragm and valve as at E. Now the piſton, being drawn up from C towards A attenuates the air above D, by which means the water ruſhes into the ſpace C D; then, when the piſton is forced down, as the water cannot repaſs at D, it is forced to aſcend into the pipe at H, and through its valve E into the ciſtern F, which may be ſituated at any diſtance above the pump, from whence the water will run off by the ſpout.

3. The lifting pump is only a forcing pump of another ſtructure, repreſented in *fig.* 16. where A B is a barrel, fixed in the frame K I L M; which alſo is fixed immoveable, with the lower part in the water to be exhauſted. G E Q H O is a frame with two ſtrong iron rods, moveable through holes in the upper and lower parts of the pump I K and L M; in the bottom of this frame is fixed an inverted piſton B D, with its bucket and valve upon the top at D. Upon the top of the barrel, there goes off a part K H, either fixed to the barrel, or moveable by a ball and ſocket, (as here repreſented at F) but in either caſe ſo very nice and tight, that no water or air can poſſibly get into the barrel, which would ſpoil the effect of the pump. In this part, at C, is fixed a valve opening upwards. Now when the piſton-frame is thruſt down into the water, the piſton D deſcends, and the water below will ruſh up through the valve D, and get above the piſton; where, upon the frame's being lifted up, the piſton will force the water through the valve C up into the ciſtern P, there to run off by the ſpout. Note, this ſort of pump is ſet ſo far in the water, that the piſton may play below the ſurface of it.

For the deſcription of a piſton that works without friction, ſee DUELLE's *Piſton.*

General Obſervations on PUMP-WORK. From what has been ſaid under the articles FLUID, ATMOSPHERE, and GRAVITY, we preſume the reaſon will appear ſufficiently evident, why no ſingle pump, though perfectly tight, can raiſe water by a piſton playing at a greater diſtance than 32 feet; nor can this be remedied by ſeveral valves in the pipe below the piſton, as ſome have pretended: for let A B (plate CVI. *fig.* 17.) be the barrel of a pump, G F the piſton, B E a pipe going from the barrel to the water at E, 60 feet below it; and let B, C, D, E, be 4 valves placed in the pipe at 20 feet diſtance from each other. Now when the piſton is drawn up from B to F, a vacuum will be made between, but the valve B will not riſe by the water below it; for the water in the part B C cannot riſe itſelf, much leſs can that in the part C D below it, as being preſſed with the weight of the column above, and its own weight downwards, therefore no part of the watry column B F can move of itſelf, or by itſelf. Now no power can be applied any where but at E to move the whole column; nor can the whole be moved without raiſing all the valves at once; therefore the power able to raiſe the valve at E, and conſequently the valve at B, muſt be able to overcome the preſſure of a column of water 60 feet high: but the air can ſuſtain a column only of 32 feet high; therefore the air cannot raiſe the valve E, nor any of the reſt; and conſequently, the water cannot riſe in the barrel A B of a ſingle pump, if longer than 32 feet.

Air PUMP. See the article AIR *Pump.*

Chain PUMP, a machine chiefly uſed on board large ſhips. It conſiſts of two rollers, one fixed at the top, and the other at the bottom of the machine. Round theſe two rollers an endleſs chain, furniſhed with burs, or ſmall leather buckets, is fixed; and on one ſide is a tube or barrel exactly fitted to the burs, extending from the deck or place where the water is delivered, to the lower roller in the well. Both theſe rollers are ribbed to prevent the chain from ſlipping, and the upper one has a double winch fixed to it. When this roller is turned round, the chain is drawn thro' the tube or barrel, and conſequently cauſes the water to aſcend with the buckets to the top of the tube, where it is diſcharged.

PUMP-BRAKE. See the article BRAKE.

PUN, or PUNN, a conceit arising from the uſe of two words that agree in ſound, but differ in the ſenſe.

PUNCH, an inſtrument of iron or ſteel, uſed in ſeveral arts, for the piercing or ſtamping holes in plates or metals, &c. being ſo contrived as not only to perforate, but to cut out and take away the piece.

PUNCHEON, PUNCHIN, or PUNCHION, a little block or piece of ſteel, on one end whereof is ſome figure, letter, or mark, engraven either in creux or relievo, impreſſions whereof are taken on metal, or ſome other matter, by ſtriking it with a hammer on the end not engraved. There are various kinds of theſe puncheons uſed in the mechanical arts; ſuch for inſtance are thoſe of the goldſmiths, cutlers, pewterers, &c.

The puncheon, in coining, is a piece of iron ſteeled, whereon the engraver has cut in relievo the ſeveral figures, arms, effigy, inſcription, &c. that are to be in the matrices, wherewith the ſpecies are to be marked. Minters diſtinguiſh three kinds of puncheons, according to the three kinds of matrices to be made; that of the effigy, that of the croſs or arms, and that of the legend, or inſcription. The firſt includes the whole portrait in relievo; the ſecond are ſmall, each only containing a piece of the croſs or arms, for inſtance, a fleur-de-lys, an harp, a coronet, &c. by the aſſemblage of all which the intire matrice is formed. The puncheons of the legend only contain each one letter, and ſerve equally for the legend on the effigy ſide and the croſs ſide. See the article COINING.

PUNCHEON is alſo uſed for ſeveral iron tools of various ſizes and figures uſed by the engravers in creux on metals. Seal-gravers particularly uſe a great number for the ſeveral pieces of arms, &c. to be engraven, and many ſtamp the whole ſeal from a ſingle puncheon.

PUNCHEON is alſo a common name for all thoſe iron inſtruments uſed by ſtone-cutters, ſculptors, blackſmiths, &c. for the cutting, inciding, or piercing their ſeveral matters.

PUNCHEON, in carpentry, is a piece of timber placed upright between two poſts, whoſe bearing is too great, ſerving, together with them, to ſuſtain ſome large weights.

PUNCHEON is alſo uſed for the arbor or principal part of a machine, whereon it turns vertically, as that of a crane, &c.

PUNCHEON is alſo a meaſure for liquids, containing an hogſhead and one third, or eighty-four gallons.

PUNTA LACRYMALIA. See the article LACRYMALIA.

PUNCTATED HYPERBOLA, an hyperbola whoſe oval conjugate is infinitely ſmall, i. e. a point.

PUNCTUATION, in grammar, the art of pointing, or of dividing a diſcourſe into periods by points expreſſing the pauſes to be made in the reading thereof. See the article POINT.

PUNCTUM, in geometry, &c. See the article POINT.

PUNCTUM SALIENS, in anatomy, the firſt rudiments of the heart in the formation of the fœtus, where a throbbing motion is perceived.

PUNCTURE, in ſurgery, any wound made by a ſharp-pointed inſtrument.

PUNICA, the pomegranate-tree. See the article POMEGRANATE-TREE.

PUNISHMENT, in law, the penalty which a perſon incurs on the breach or tranſgreſſion of any law.

PUPIL, *pupillus*, in the civil law, a boy or girl not yet arrived at the age of puberty. i. e. the boy under fourteen years, and the girl under twelve.

PUPIL is alſo uſed in univerſities, &c. for a youth under the education or diſcipline of any perſon.

PUPIL, *pupilla*, in anatomy, a little aperture in the middle of the uvea and iris of the eye, through which the rays of light paſs to the cryſtalline, in order to be painted on the retina, and cauſe viſion.

PURCHASE, in law, the buying or acquiring of lands, &c. with money, by deed or agreement, and not by deſcent or right of inheritance.

PURE, ſomething free from any admixture of foreign or heterogeneous matters: thus we ſay pure fire, &c. See the article FIRE, &c.

PURE HYPERBOLA, in conics, is an hyperbola without any oval, nodes, ſpike, or conjugate point.

PURFLEW, a term in heraldry, expreſſing ermins, peans, or any of the furs, when they compoſe a bordure round a coat of arms: thus they ſay, He beareth gules a bordure, purflew, vairy: meaning that the bordure is vairy.

PURGATIVE, or PURGING MEDICINES, a medicament which evacuates the impurities of the body by ſtool, called alſo cathartics.

PURGATORY, a place in which the juſt, who depart out of this life, are ſuppoſed to expiate certain offences which do not merit eternal damnation.

Broughton has endeavoured to prove, that this notion has been held by Pagans, Jews, and Mahometans, as well as by Chriſtians.

PURIFICATION, in matters of religion, a ceremony which conſiſts in cleanſing any thing from a ſuppoſed pollution or defilement.

PURIFICATION *of the Bleſſed Virgin*, a feſtival of the chriſtian church, obſerved on the ſecond of February, in memory of the purification of Chriſt in the temple, and his mother's ſubmitting to the Jewiſh law of purification, after the birth of a male child.

PURIFICATION, in chemiſtry, the act of purifying or refining natural bodies by ſeparating the fæces and impurities from them.

PURIM, or *the Feaſt of Lots*, a ſolemn feſtival of the Jews, inſtituted in memory of the deliverance they received from Haman's wicked attempt to deſtroy them, by means of Mordecai and Eſther.

PURITAN, a name formerly given in deriſion to the diſſenters from the church of England, on account of their profeſſing to follow the pure word of God, in oppoſition to all traditions and human conſtitutions.

PURLINS, in building, thoſe pieces of timber that lie acroſs the rafters on the inſide, to keep them from ſinking in the middle of their length.

PURLUE, or PURLIEU, ſignifies all that ground near any foreſt, which being made foreſt by king Henry II. Richard I. and king John, was afterwards by perambulations and grants of Henry III. ſevered again from the ſame, and made purlieu; that is to ſay, pure and free from the laws of the foreſt.

PURLUE-MAN, or PURLIEU-MAN, a perſon who has ground within the purlieu, and is qualified to hunt within the ſame, though under certain reſtrictions.

PURPLE, a colour compoſed of a mixture of red and blue.

A beautiful tranſparent purple for painting, may be made by boiling four ounces of raſped Braſil-wood in a pint of ſtale beer, and half an ounce of logwood, till the liquor is heightened to the colour you deſire, which may be known by dipping a piece of paper in it. If you find it too red, add a quarter of an ounce more of logwood, which will render it ſtill deeper, and by this method you may bring it to any degree of purple, by putting in either more or leſs logwood to the former compoſition, and fixing it with alum. This will produce ſuch a clear purple as no mixture of reds and blues will produce. Madam Mariana of Amſterdam, famous for painting in miniature, and for her excellent manner of illuminating prints, ſays, that the beſt purple that can be made, may be compoſed between the carmine and indigo; to ſtrengthen which, on the red ſide, you may add lake, between the lighter and darker part: and ſo lake when it is uſed in the ſame way, on the foregoing purple, produces a very fine effect.

PURPLE FEVER, the ſame with miliary fever. See the article FEVER.

PURPURA, in natural hiſtory, a genus of ſimple ſhells, having no hinge, formed of one continuous piece, and covered from the top to the bottom with ſpines, tubercles, and umbos: the mouth is ſmall, and approaches to a round figure: the clavicle is ſhort, but the other extremity is uſually protended to a conſiderable length.

PURPURE, POURPRE, or PURPLE, in heraldry, according to ſome, is one of the five colours of armories, compounded of gules and azure, bordering on violet, and according to others, of a great deal of red and a little black. But it was excluded by the antient heralds as only an imperfect colour. In the coats of noblemen it is

called amethyſt; and in thoſe of princes, mercury. It is repreſented in engraving, by diagonal lines drawn from the ſiniſter chief to the dexter baſe point.

PURREL, a liſt ordained by act of parliament to be made at the end of kerſeys, to prevent deceit in diminiſhing their length.

PURSIVENESS, among farriers, is a diſorder in horſes, otherwiſe called broken wind, in which the horſe makes a hiſſing whiſtling ſound in his throat, and has a greater heaving in the flanks than in common colds.

PUS, in medicine, a white or yellowiſh putrid matter, formed of corrupted blood, and contained in a wound or ulcer.

PUSTULE, a pimple, or ſmall eruption on the ſkin full of pus.

PUTLOGS, or PUTLOCKS, in building, are ſhort pieces of timber about ſeven feet long, uſed in building ſcaffolds. They lie at right angles to the wall with one of their ends reſting upon it, and the other upon the poles which lie parallel to the ſide of the wall of the building.

PUTREFACTION, a kind of ſlow corruption produced by heat and ſome moiſt fluid, particularly the air and water; which, penetrating the pores, diſſolves and ſets at liberty ſome of the more ſubtile parts, particularly the ſalts and oils, and thus looſens the compages, and changes the texture of bodies.

PUTRID, ſomething rotten, or putrefied.

PUTTY, the ſame with ſpodium. See SPODIUM.

PUTTY, in its popular ſenſe, is a kind of paſte compounded of whiting and linſeed oil, beaten together to the conſiſtence of a thick dough.

It is uſed by glaziers for the faſtening in the ſquares of glaſs in ſaſh-windows, and by painters for ſtopping up the crevices and clefts in timber and wainſcots, &c.

PUTTY ſometimes alſo denotes the powder of calcined tin, uſed in poliſhing and giving the laſt gloſs to works of iron and ſteel.

PYCNOSTYLE, in the antient architecture, is a building where the columns ſtand very cloſe to each other; only one diameter and a half of the column being allowed for the intercolumniations.

According to Mr. Evelyn, the pycnoſtyle chiefly belonged to the Compoſite order, and was uſed in the moſt magnificent buildings; as at preſent in the periſtyle at St. Peter's at Rome, which conſiſts of near three hundred columns; and in ſuch as yet remain of the antients, among the late diſcovered ruins of Palmyra.

PYGME, the ſame with cubit. See the article CUBIT.

PYGMY, a perſon not exceeding a cubit in height.

PYLORUS, in anatomy, the right or lower orifice of the ſtomach, which is connected with and opens into the inteſtines. See the article STOMACH and INTESTINES.

PYRAMID, *πυραμις*, in geometry, a ſolid ſtanding on a triangular, ſquare, or polygonal baſis, and terminating in a point at the top; or, according to Euclid, it is a ſolid figure, conſiſting of ſeveral triangles, whoſe baſes are all in the ſame plane, and have one common vertex.

Hence the ſuperficies of a given pyramid is eaſily found by meaſuring theſe triangles ſeparately; for their ſum added to the area of the baſe, is the ſurface of the pyramid required.

It is no leſs eaſy to find the ſolid content of a given pyramid; for the area of the baſe being found, let it be multiplied by the third part of the height of the pyramid, or the third part of the baſe by the height, and the product will give the ſolid content, as is demonſtrated by Euclid, lib. 12 prop. 7.

If the ſolid content of a fruſtum of a pyramid is required, firſt let the ſolid content of the whole pyramid be found; from which ſubſtract the ſolid content of the part that is wanting, and the ſolid content of the fruſtum, or broken pyramid will remain. See FRUSTUM.

Every pyramid is equal to one third of its circumſcribing priſm, or that has the ſame baſe and height.

All pyramids are in a ratio compounded of their baſes and altitudes; ſo that, if their baſes be equal, they are in proportion to their altitudes; and *vice verſa*.

Equal pyramids reciprocate their baſes and altitudes; that is, the altitude of one is to that of the other, as the baſe of the one is to that of the other.

PYRAMID, in architecture, a ſolid maſſive building, which from a ſquare, triangular, or other baſe, riſes diminiſhing to a vertex or point.

Pyramids are ſometimes uſed to preſerve the memory of ſingular events; and ſometimes to tranſmit to poſterity the glory and magnificence of princes. But as they are eſteemed a ſymbol of immortality, they are moſt commonly uſed as funeral monuments. Such is that of Ceſtius at Rome, and thoſe other celebrated ones of Egypt, as famous for the enormity of their ſize, as their antiquity. Theſe are ſituated on the weſt ſide of the Nile almoſt oppoſite to Grand Cairo; the baſe of the largeſt covers more than ten acres of ground, and is, according to ſome, near ſeven hundred feet high, though others make it ſix hundred, and ſome but little more than five hundred. The pyramid is ſaid to have been, among the Egyptians, a ſymbol of human life; the beginning of which is repreſented by the baſe, and the end, by the apex; on which account it was, that they uſed to erect them over ſepulchres.

PYRAMIDAL, ſomething relating to a pyramid.

PYRAMIDALIA CORPORA, in anatomy, the two protuberances of the medulla oblongata. The ſpermatic veſſels are alſo by ſome authors thus termed.

PYRAMIDALIS, in anatomy, a ſmall muſcle in the abdomen lying in the lower part of the rectus. It has its name from its figure, and its origin from the margin of the os pubis, with a broad fleſhy head, whence it grows gradually narrower, till it ends in a ſmall round tendon in the linea alba, ſometimes almoſt at the navel. This muſcle is ſometimes ſingle, ſometimes it has its fellow, and in ſome ſubjects they are both wanting.

PYRAMIDALIS is alſo the name of one of the dilatores, or muſcles which ſerve to turn up the noſe. This muſcle riſes at the foot of the noſe, and is uſually continuous with the frontalis. It deſcends along the ſide of the noſe, where it is by degrees a little expanded. It is inſerted into the alæ of the noſe, and often ſends down its fibres as far as to the upper-lip.

PYRAMIDOID, the ſame with the parabolic ſpindle.

PYRENOIDES PROCESSUS, in anatomy, a proceſs of the ſecond vertebra of the neck, called alſo odontoides, and dentiformis.

PYRETICS, medicines good againſt fevers. See FEVER and FEBRIFUGE.

PYRIFORMIS, in anatomy, a muſcle of the thigh, receiving its name from its figure, which reſembles that of a pear. It riſes thick from the lower part of the os ſacrum, where it is joined to the ileum; from thence it runs tranſverſely towards the joint of the hip, and terminates in a ſhort tendon, which is inſerted in the middle of the internal labium of the upper edge of the great trochanter, by two or three branches.

PYRITES, in natural hiſtory, a claſs of compound inflammable metallic bodies found in detached maſſes, but of no determinately angular figure. See the article COPPERAS.

PYROMANCY, *πυρομαντεια*, a kind of divination by means of fire. The ancients imagined they could foretel future events, by inſpecting fire and flame; and to this end, they conſidered its direction, which way it turned: ſometimes they added other matters to the fire, ſuch as a veſſel full of urine, having its neck bound about with wool, watching narrowly on which ſide it burſt, and thence taking their augury: ſometimes they threw pitch on it; and, if it took fire immediately, they eſteemed it a good augury.

PYROTECHNY, *πυροτεχνια*, the art of fire, or a ſcience which teaches the management and application of fire, in ſeveral operations. Pyrotechny is of two kinds, military and chemical: military pyrotechny is the doctrine of artificial fire-works and fire-arms, teaching the ſtructure and uſe of thoſe uſed in war, the attacking of fortifications, &c. as gun-powder, cannons, bombs, granadoes, carcaſſes, mines, fuſees, &c. and thoſe made for amuſement ſake, as rockets, ſerpents, &c.

PYROTICS, *πυρωτικα*, in medicine, cauſtics, or remedies, either actually or potentially hot; and which accordingly

accordingly will burn the flesh and raise an eschar. See CAUSTICS

PYRRHICHIUS, in the Greek and Latin poetry, a foot consisting of two syllables, both short, as *deus*.

PYRRHONIANS, PYRRHONEANS, or PYRRHONISTS, a sect of ancient philosophers, so called from Pyrrho, a native of Elis, in Peloponnesus. The opinions of these philosophers, who were also called Sceptics, terminated in the incomprehensibility of all things, in which they found reason both for affirming and denying: accordingly they seemed, during their whole lives, to be in search of truth, without ever acknowledging that they had found it: hence the art of disputing upon all things, without ever going farther than suspending our judgment, is called pyrrhonism.

Pyrrho maintained, that life and death were equally indifferent; and he is charged with teaching, that honour and infamy, the justice and injustice of actions, depended solely on human laws and customs; and, in a word, that there is nothing in itself honest or dishonest, just or unjust: an abominable doctrine, that opens the way to all manner of crimes.

PYTHAGOREANS, a sect of ancient philosophers, so denominated from their being the followers of Pythagoras of Samos, who lived in the reign of Tarquin, the last king of the Romans, in the year of Rome 220; or, according to Livy, in the reign of Servius Tullius, in the year of the world 3472.

Pythagoras, from his extraordinary desire of knowledge, travelled in order to enrich his mind with the learning of the several countries through which he passed. He was the first that took the name of philosopher, that is, a lover of wisdom, which implied, that he did not ascribe the possession of wisdom to himself, but only the desire of possessing it.

His maxims of morality were admirable: for he was for having the study of philosophy solely tend to elevate man to a resemblance of the Deity. He believed that God is a soul diffused through all nature, and that from him human souls are derived; that they are immortal, and that men need only take pains to purge themselves of their vices, in order to be united to the Deity. He made unity the principle of all things; and believed, that between God and man there are various orders of spiritual beings, who are the ministers of the Supreme Being. He condemned all images of the Deity, and would have him worshipped with as few ceremonies as possible. His disciples brought all their goods into a common stock, contemned the pleasures of sense, abstained from swearing, eat nothing that had life, and believed in the doctrine of a metempsychosis. See the article METEMPSYCHOSIS.

Pythagoras made his scholars undergo a severe noviciate of silence for at least two years; and it is said, that where he discerned too great an itch for talking, he extended it to five: his disciples were therefore divided into two classes, of which the first were simple hearers, and the last such as were allowed to propose their difficulties, and learn the reasons of all that was taught them. The Pythagoreans, it is said, on their rising from bed, roused the mind with the sound of the lyre, in order to make them more fit for the actions of the day; and at night resumed the lyre, in order to prepare themselves for sleep, by calming all their tumultuous thoughts. The figurative manner in which he gave his instructions, was borrowed from the Hebrews, Egyptians, and other orientals. Some think he derived his philosophy from the books of Moses, and that he conversed with Ezekiel and Daniel at Babylon; but this is mere conjecture.

Some authors say, that he left nothing in writing; but Laërtius and others attribute several treatises to him. His golden verses, attributed by some to one of his disciples, are allowed to be an exact copy of the sentiments of that Divine Philosopher, from whose school proceeded the greatest philosophers and legislators.

PYTHIA, in antiquity, the priestess of Apollo at Delphi, by whom he delivered oracles: she was thus called from the god himself, who was denominated Apollo Pythios, from his slaying the serpent Python.

This priestess was to be a pure virgin: she sat on the lid of a brazen vessel mounted on a tripod or three-legged stool; and thence, after a violent enthusiasm, delivered her oracles in a few ambiguous and obscure verses, or in a short sentence in prose. See ORACLE.

PYTHIAN GAMES, in antiquity, solemn games celebrated near Delphi, in honour of Apollo, in remembrance of his having killed the serpent Python.

These were held every two years, about the month Elaphebolion, which answered to our February. The celebration of these games was attended with the Pythian song, in which was celebrated the fight of Apollo and the serpent. The victors were crowned with branches of laurel; though, at the first institution, the crown was of beech-leaves.

PYXIDIUM, CUP-MOSS, in botany, a genus of mosses, consisting of a firm, tough, and flexile matter, formed into the shape of hollowed cups, or drinking glasses, with longer or shorter stems.

PYXIS, in anatomy, the acetabulum, or cavity of the hip-bone.

END OF THE SECOND VOLUME.
